(a) Included are various equity-linked or other indexed instruments. Embedded derivatives separated from hybrid securities in accordance with SFAS 133 are reported at fair value and shown net with the host contract on the Consolidated balance sheets. Changes in fair value of separated derivatives are recorded in Principal transactions revenue. Hybrid securities which the Firm has elected to measure at fair value are classified in the line item of the host contract on the Consolidated balance sheets; changes in fair values are recorded in Principal transactions revenue in the Consolidated statements of income.

(b) The interest rates shown are the range of contractual rates in effect at year-end, including non-U.S. dollar-fixed- and variable-rate issuances, which excludes the effects of the associated derivative instruments used in SFAS 133 hedge accounting relationships, if applicable. The use of these derivative instruments modifies the Firm's exposure to the contractual interest rates disclosed in the table above. Including the effects of the SFAS 133 hedge accounting derivatives, the range of modified rates in effect at December 31, 2007, for total long-term debt was 0.11% to 14.21%, versus the contractual range of 0.75% to 14.21% presented in the table above.

(c) Included $70.5 billion and $25.4 billion of outstanding structured notes accounted for at fair value at December 31, 2007 and 2006, respectively.

(d) Included on the Consolidated balance sheets in Beneficial interests issued by consolidated variable interest entities. Also included $3.0 billion of outstanding structured notes accounted for at fair value at December 31, 2007.

(e) At December 31, 2007, long-term debt aggregating $10.8 billion was redeemable at the option of JPMorgan Chase, in whole or in part, prior to maturity, based upon the terms specified in the respective notes.

(f) The aggregate principal amount of debt that matures in each of the five years subsequent to 2007 is $28.7 billion in 2008, $30.6 billion in 2009, $25.3 billion in 2010, $15.1 billion in 2011 and $21.0 billion in 2012.

(g) Included $4.6 billion and $3.0 billion of outstanding zero-coupon notes at December 31, 2007 and 2006, respectively. The aggregate principal amount of these notes at their respective maturities was $7.7 billion and $6.8 billion, respectively.

The weighted-average contractual interest rate for total Long-term debt was 5.20% and 4.89% as of December 31, 2007 and 2006, respectively. In order to modify exposure to interest rate and currency exchange rate movements, JPMorgan Chase utilizes derivative instruments, primarily interest rate and cross-currency interest rate swaps, in conjunction with some of its debt issues. The use of these instruments modifies the Firm's interest expense on the associated debt. The modified weighted-average interest rate for total long-term debt, including the effects of related derivative instruments, was 5.13% and 4.99% as of December 31, 2007 and 2006, respectively.

JPMorgan Chase & Co. (Parent Company) has guaranteed certain debt of its subsidiaries, including both long-term debt and structured notes sold as part of the Firm's trading activities. These guarantees rank on a parity with all of the Firm's other unsecured and unsubordinated indebtedness. Guaranteed liabilities totaled $46 million and $30 million at December 31, 2007 and 2006, respectively.

Junior subordinated deferrable interest debentures held by trusts that issued guaranteed capital debt securities

At December 31, 2007, the Firm had established 22 wholly owned Delaware statutory business trusts ("issuer trusts") that had issued guaranteed capital debt securities.

The junior subordinated deferrable interest debentures issued by the Firm to the issuer trusts, totaling $15.1 billion and $12.2 billion at December 31, 2007 and 2006, respectively, were reflected in the Firm's Consolidated balance sheets in the Liabilities section under the caption "Junior subordinated deferrable interest debentures held by trusts that issued guaranteed capital debt securities" (i.e., trust preferred capital debt securities). The Firm also records the common capital securities issued by the issuer trusts in Other assets in its Consolidated balance sheets at December 31, 2007 and 2006.

The debentures issued to the issuer trusts by the Firm, less the common capital securities of the issuer trusts, qualify as Tier1 capital. The following is a summary of the outstanding trust preferred capital debt securities, including unamortized original issue discount, issued by each trust and the junior subordinated deferrable interest debenture issued by JPMorgan Chase to each trust as of December 31, 2007.

December 31, 2007 (in millions)	Amount of capital debt securities issued by trust[a]	Principal amount of debenture issued to trust[b]	Issue date	Stated maturity of capital securities and debentures	Earliest redemption date	Interest rate of capital securities and debentures	Interest payment/ distribution dates
Bank One Capital III	$ 474	$ 623	2000	2030	Any time	8.75%	Semiannually

JPMorgan Chase Capital XXII	996	997	2007	2037	Any time	6.45%	Semiannually
JPMorgan Chase Capital XXIII	746	746	2007	2047	2012	LIBOR + 1.00%	Quarterly
JPMorgan Chase Capital XXIV	700	700	2007	2047	2012	6.88%	Quarterly
JPMorgan Chase Capital XXV	1,491	1,606	2007	2037	2037	6.80%	Semiannually
Total	$14,909	$15,148					

(a) Represents the amount of capital securities issued to the public by each trust, including unamortized original issue discount.
(b) Represents the principal amount of JPMorgan Chase debentures issued to each trust, including unamortized original issue discount. The principal amount of debentures issued to the trusts includes the impact of hedging and purchase accounting fair value adjustments that were recorded on the Firm's Consolidated financial statements.

Note 22 – Preferred stock

JPMorgan Chase is authorized to issue 200 million shares of preferred stock, in one or more series, with a par value of $1 per share. There was no preferred stock outstanding at December 31, 2007 and 2006. Preferred stock outstanding at December 31, 2005, was 280,433 shares of 6.63% Series H cumulative preferred stock. On March 31, 2006, JPMorgan Chase redeemed all 280,433 shares. Dividends on shares of the Series H preferred stock were payable quarterly.

Note 23 – Common stock

At December 31, 2007, JPMorgan Chase was authorized to issue 9.0 billion shares of common stock with a $1 par value per share. Common shares issued (newly issued or distributed from treasury) by JPMorgan Chase during 2007, 2006 and 2005 were as follows.

December 31, (in millions)	**2007**	2006	2005
Issued – balance at January 1	**3,657.8#**	3,618.2#	3,584.8#
Newly issued:			
Employee benefits and compensation plans	**—**	39.3	34.0
Employee stock purchase plans	**—**	0.6	1.4
Total newly issued	**—**	39.9	35.4
Canceled shares	**(0.1)**	(0.3)	(2.0)
Total issued – balance at December 31	**3,657.7#**	3,657.8#	3,618.2#
Treasury – balance at January 1	**(196.1)#**	(131.5)#	(28.6)#
Purchase of treasury stock	**(168.2)**	(90.7)	(93.5)
Share repurchases related to employee stock-based awards[a]	**(2.7)**	(8.8)	(9.4)
Issued from treasury:			
Employee benefits and compensation plans	**75.7**	34.4	—
Employee stock purchase plans	**1.0**	0.5	—
Total issued from treasury	**76.7**	34.9	—
Total treasury – balance at December 31	**(290.3)**	(196.1)	(131.5)
Outstanding	**3,367.4#**	3,461.7#	3,486.7#

(a) Participants in the Firm's stock-based incentive plans may have shares withheld to cover income taxes. The shares withheld amounted to 2.7 million, 8.1 million and 8.2 million for 2007, 2006 and 2005, respectively.

On April 17, 2007, the Board of Directors approved a stock repurchase program that authorizes the repurchase of up to $10.0 billion of the Firm's common shares, which supersedes an $8.0 billion stock repurchase program approved in 2006. The $10.0 billion authorization includes shares to be repurchased to offset issuances under the Firm's employee stock-based plans. The actual number of shares repurchased is subject to various factors, including market conditions; legal considerations affecting the amount and timing of repurchase activity; the Firm's capital position (taking into account goodwill and intangibles); internal capital generation and alternative potential investment opportunities. The repurchase program does not include specific price targets or timetables; may be executed through open market purchases or privately negotiated transactions, or utilizing Rule 10b5-1 programs; and may be suspended at any time. During 2007, 2006 and 2005, the Firm repurchased 168 million shares, 91 million shares and 94 million shares, respectively, of common stock under stock repurchase programs approved by the Board of Directors.

As of December 31, 2007, approximately 431 million unissued shares of common stock were reserved for issuance under various employee or director incentive, compensation, option and stock purchase plans.

Note 24 – Earnings per share

SFAS 128 requires the presentation of basic and diluted earnings per share ("EPS") in the Consolidated statement of income. Basic EPS is computed by dividing net income applicable to common stock by the weighted-average number of common shares outstanding for the period. Diluted EPS is computed using the same method, for the numerator, as basic EPS but, in the denominator, the number of common shares reflect, in addition to outstanding shares, the potential dilution that could occur if convertible securities or other contracts to issue common stock were converted or exercised into common stock. Net income available for common stock is the same for basic EPS and diluted EPS, as JPMorgan Chase had no convertible securities, and therefore, no adjustments to Net income available for common stock were necessary. The following table presents the calculation of basic and diluted EPS for 2007, 2006 and 2005.

Year ended December 31, (in millions, except per share amounts)	**2007**	2006	2005
Basic earnings per share			
Income from continuing operations	**$ 15,365**	$ 13,649	$ 8,254
Discontinued operations	**—**	795	229
Net income	**15,365**	14,444	8,483
Less: preferred stock dividends	**—**	4	13
Net income applicable to common stock	**$ 15,365**	$ 14,440	$ 8,470
Weighted-average basic shares outstanding	**3,404#**	3,470#	3,492#
Income from continuing operations per share	**$ 4.51**	$ 3.93	$ 2.36
Discontinued operations per share	**—**	0.23	0.07
Net income per share	**$ 4.51**	$ 4.16	$ 2.43
Diluted earnings per share			
Net income applicable to common stock	**$ 15,365**	$ 14,440	$ 8,470
Weighted-average basic shares outstanding	**3,404#**	3,470#	3,492#
Add: Employee restricted stock, RSUs, stock options and SARs	**104**	104	65
Weighted-average diluted shares outstanding[a]	**3,508#**	3,574#	3,557#
Income from continuing operations per share	**$ 4.38**	$ 3.82	$ 2.32
Discontinued operations per share	**—**	0.22	0.06
Net income per share	**$ 4.38**	$ 4.04	$ 2.38

(a) Options issued under employee benefit plans to purchase 129 million, 150 million and 280 million shares of common stock were outstanding for the years ended December 31, 2007, 2006 and 2005, respectively, but were not included in the computation of diluted EPS because the options were antidilutive.

Note 25 – Accumulated other comprehensive income (loss)

Accumulated other comprehensive income (loss) includes the after-tax change in SFAS 115 unrealized gains and losses on AFS securities, SFAS 52 foreign currency translation adjustments (including the impact of related derivatives), SFAS 133 cash flow hedging activities and SFAS 158 net loss and prior service cost (credit) related to the Firm's defined benefit pension and OPEB plans.

(in millions)	Unrealized gains (losses) on AFS securities[a]	Translation adjustments, net of hedges	Cash flow hedges	Net loss and prior service (credit) of defined benefit pension and OPEB plans[e]	Accumulated other comprehensive income (loss)
Balance at December 31, 2004	$ (61)	$ (8)	$ (139)	$ —	$ (208)
Net change	(163)[b]	—	(255)	—	(418)
Balance at December 31, 2005	(224)	(8)	(394)	—	(626)
Net change	253[c]	13	(95)	—	171
Adjustment to initially apply SFAS 158, net of taxes	—	—	—	(1,102)	(1,102)
Balance at December 31, 2006	29	5	(489)	(1,102)	(1,557)
Cumulative effect of changes in accounting principles (SFAS 159)	**(1)**	**—**	**—**	**—**	**(1)**
Balance at January 1, 2007, adjusted	**28**	**5**	**(489)**	**(1,102)**	**(1,558)**
Net change	**352**[d]	**3**	**(313)**	**599**	**641**
Balance at December 31, 2007	**$ 380**	**$ 8**	**$ (802)**	**$ (503)**	**$ (917)**

(a) Represents the after-tax difference between the fair value and amortized cost of the AFS securities portfolio and retained interests in securitizations recorded in Other assets.
(b) The net change during 2005 was due primarily to higher interest rates, partially offset by the reversal of unrealized losses from securities sales.
(c) The net change during 2006 was due primarily to the reversal of unrealized losses from securities sales.
(d) The net change during 2007 was due primarily to a decline in interest rates.
(e) For further discussion of SFAS 158, see Note 9 on pages 124–130 of this Annual Report.

The following table presents the after-tax changes in net unrealized holdings gains (losses), reclassification adjustments for realized gains and losses on AFS securities and cash flow hedges, changes resulting from foreign currency translation adjustments (including the impact of related derivatives), net gains and losses and prior service costs from pension and OPEB plans, and amortization of pension and OPEB amounts into Net income. The table also reflects the adjustment to Accumulated other comprehensive income (loss) resulting from the initial application of SFAS 158 to the Firm's defined benefit pension and OPEB plans. Reclassification adjustments include amounts recognized in Net income that had been recorded previously in Other comprehensive income (loss).

	2007			2006			2005		
Year ended December 31, (in millions)	Before tax	Tax effect	After tax	Before tax	Tax effect	After tax	Before tax	Tax effect	After tax

(a) For further discussion of SFAS 158 and details of changes to Accumulated other comprehensive income (loss), see Note 9 on pages 124–130 of this Annual Report.

Note 26 – Income taxes

In June 2006, the FASB issued FIN 48, which clarifies the accounting for uncertainty in income taxes recognized under SFAS 109. FIN 48 addresses the recognition and measurement of tax positions taken or expected to be taken, and also provides guidance on derecognition, classification, interest and penalties, accounting in interim periods and disclosure. The Firm adopted and applied FIN 48 under the transition provisions to all of its income tax positions at the required effective date of January 1, 2007, resulting in a $436 million cumulative effect increase to Retained earnings, a reduction in Goodwill of $113 million and a $549 million decrease in the liability for income taxes.

JPMorgan Chase and eligible subsidiaries file a consolidated U.S. federal income tax return. JPMorgan Chase uses the asset-and-liability method required by SFAS 109 to provide income taxes on all transactions recorded in the Consolidated financial statements. This method requires that income taxes reflect the expected future tax consequences of temporary differences between the carrying amounts of assets or liabilities for book and tax purposes. Accordingly, a deferred tax liability or asset for each temporary difference is determined based upon the tax rates that the Firm expects to be in effect when the underlying items of income and expense are realized. JPMorgan Chase's expense for income taxes includes the current and deferred portions of that expense. A valuation allowance is established to reduce deferred tax assets to the amount the Firm expects to realize.

Due to the inherent complexities arising from the nature of the Firm's businesses, and from conducting business and being taxed in a substantial number of jurisdictions, significant judgments and estimates are required to be made. Agreement of tax liabilities between JPMorgan Chase and the many tax jurisdictions in which the Firm files tax returns may not be finalized for several years. Thus, the Firm's final tax-related assets and liabilities may ultimately be different than those currently reported.

At December 31, 2007, and January 1, 2007, JPMorgan Chase's unrecognized tax benefits, excluding related interest expense and penalties, was $4.8 billion and $4.7 billion, respectively, of which $1.3 billion and $1.0 billion, if recognized, would reduce the annual effective tax rate. As JPMorgan Chase is presently under audit by a number of tax authorities, it is reasonably possible that unrecognized tax benefits could change significantly over the next 12 months. JPMorgan Chase does not expect that any such changes would have a material impact on its annual effective tax rate.

The following table presents a reconciliation of the beginning and ending amount of unrecognized tax benefits for the year ended December 31, 2007.

Unrecognized tax benefits
Year ended December 31, 2007 (in millions)

Balance at January 1, 2007	$ 4,677
Increases based on tax positions related to the current period	434
Decreases based on tax positions related to the current period	(241)
Increases based on tax positions related to prior periods	903
Decreases based on tax positions related to prior periods	(791)
Decreases related to settlements with taxing authorities	(158)
Decreases related to a lapse of applicable statute of limitations	(13)
Balance at December 31, 2007	$ 4,811

Pretax interest expense and penalties related to income tax liabilities recognized in Income tax expense was $516 million ($314 million after-tax) in 2007. Included in Accounts payable, accrued expense and other liabilities at January 1, 2007, in addition to the Firm's liability for unrecognized tax benefits, was $1.3 billion for income tax-related interest and penalties, of which the penalty component was insignificant. Accrued income tax-related interest and penalties increased to $1.6 billion at December 31, 2007, due to the continuing outstanding status of the unrecognized tax benefit liability, the penalty component of which remains insignificant.

JPMorgan Chase is subject to ongoing tax examinations by the tax authorities of the various jurisdictions in which it operates, including U.S. federal, state and non-U.S. jurisdictions. The Firm's consolidated federal income tax returns are presently under examination by the Internal Revenue Service (IRS) for the years 2003, 2004 and 2005. The consolidated federal income tax returns of heritage Bank One Corporation, which merged with and into JPMorgan Chase on July 1, 2004, are under examination for the years 2000 through 2003, and for the period January 1, 2004, through July 1, 2004. Both examinations are expected to conclude in the latter part of 2008. The IRS audit of the 2006 consolidated federal income tax return has not yet commenced. Certain administrative appeals are pending with the IRS relating to prior examination periods, for JPMorgan Chase for the years 2001 and 2002, and for Bank One and its predecessor entities for various periods from 1996 through 1999. For years prior to 2001, refund claims relating to income and credit adjustments, and to tax attribute carrybacks, for JPMorgan Chase and its predecessor entities, including Bank One, either have been or will be filed. Also, interest rate swap valuations by a Bank One predecessor entity for the years 1990 through 1993 are, and have been, the subject of litigation in both the Tax Court and the U.S. Court of Appeals.

Deferred income tax expense (benefit) results from differences between assets and liabilities measured for financial reporting and for income-tax return purposes. The significant components of deferred tax assets and liabilities are reflected in the following table.

December 31, (in millions)	**2007**	2006
Deferred tax assets		
Allowance for loan losses	**$ 3,800**	$ 2,910
Allowance for other than loan losses	**3,635**	3,533
Employee benefits	**3,391**	5,175
Non-U.S. operations	**285**	566
Fair value adjustments	**—**	427
Gross deferred tax assets	**$11,111**	$12,611
Deferred tax liabilities		
Depreciation and amortization	**$ 2,966**	$ 3,668
Leasing transactions	**2,304**	2,675
Non-U.S. operations	**1,790**	1,435
Fair value adjustments	**570**	—
Fee income	**548**	1,216
Other, net	**207**	78
Gross deferred tax liabilities	**$ 8,385**	$ 9,072
Valuation allowance	**$ 220**	$ 210
Net deferred tax asset	**$ 2,506**	$ 3,329

A valuation allowance has been recorded in accordance with SFAS 109, primarily relating to capital losses associated with certain portfolio investments.

The components of income tax expense included in the Consolidated statements of income were as follows.

Year ended December 31, (in millions)	2007	2006	2005
Current income tax expense			
U.S. federal	**$ 2,805**	$ 5,512	$ 4,178
Non-U.S.	**2,985**	1,656	887
U.S. state and local	**343**	879	311
Total current income tax expense	**6,133**	8,047	5,376
Deferred income tax expense (benefit)			
U.S. federal	**1,122**	(1,628)	(2,063)
Non-U.S.	**(185)**	194	316
U.S. state and local	**370**	(376)	(44)
Total deferred income tax expense (benefit)	**1,307**	(1,810)	(1,791)
Total income tax expense from continuing operations	**7,440**	6,237	3,585
Total income tax expense from discontinued operations	**—**	572	147
Total income tax expense	**$ 7,440**	$ 6,809	$ 3,732

Total income tax expense includes $367 million of tax benefits recorded in 2006 as a result of tax audit resolutions.

The preceding table does not reflect the tax effect of certain items that are recorded each period directly in Stockholders' equity as prescribed by SFAS 52, SFAS 115, SFAS 133 and SFAS 158, and certain tax benefits associated with the Firm's employee stock-based compensation plans. Also not reflected are the cumulative tax effects of initially implementing in 2007, SFAS 157, SFAS 159 and FIN 48, and in 2006, SFAS 155, SFAS 156 and SFAS 158. The tax effects of all items recorded directly to Stockholders' equity was an increase in Stockholders' equity of $159 million, $885 million, and $425 million in 2007, 2006, and 2005, respectively.

U.S. federal income taxes have not been provided on the undistributed earnings of certain non-U.S. subsidiaries, to the extent that such earnings have been reinvested abroad for an indefinite period of time. For 2007, such earnings approximated $1.4 billion on a pretax basis. At December 31, 2007, the cumulative amount of undistributed pretax earnings in these subsidiaries approximated $3.4 billion. It is not practicable at this time to determine the income tax liability that would result upon repatriation of these earnings.

On October 22, 2004, the American Jobs Creation Act of 2004 (the "Act") was signed into law. The Act created a temporary incentive for U.S. companies to repatriate accumulated foreign earnings at a substantially reduced U.S. effective tax rate by providing a dividends received deduction on the repatriation of certain foreign earnings to the U.S. taxpayer (the "repatriation provision"). The deduction was subject to a number of limitations and requirements. In the fourth quarter of 2005, the Firm applied the repatriation provision to $1.9 billion of cash from foreign earnings, resulting in a net tax benefit of $55 million. The $1.9 billion of cash was invested in accordance with the Firm's domestic reinvestment plan pursuant to the guidelines set forth in the Act.

The tax expense (benefit) applicable to securities gains and losses for the years 2007, 2006 and 2005 was $60 million, $(219) million and $(536) million, respectively.

A reconciliation of the applicable statutory U.S. income tax rate to the effective tax rate for continuing operations for the past three years is shown in the following table.

Year ended December 31,	2007	2006	2005
Statutory U.S. federal tax rate	**35.0%**	35.0%	35.0%
Increase (decrease) in tax rate resulting from:			
U.S. state and local income taxes, net of federal income tax benefit	**2.0**	2.1	1.4
Tax-exempt income	**(2.4)**	(2.2)	(3.1)
Non-U.S. subsidiary earnings	**(1.1)**	(0.5)	(1.4)
Business tax credits	**(2.5)**	(2.5)	(3.7)
Other, net	**1.6**	(0.5)	2.1
Effective tax rate	**32.6%**	31.4%	30.3%

The following table presents the U.S. and non-U.S. components of Income from continuing operations before income tax expense.

Year ended December 31, (in millions)	2007	2006	2005
U.S.	**$ 13,720**	$ 12,934	$ 8,683
Non-U.S.[(a)]	**9,085**	6,952	3,156
Income from continuing operations before income tax expense	**$ 22,805**	$ 19,886	$ 11,839

(a) For purposes of this table, non-U.S. income is defined as income generated from operations located outside the United States.

Note 27 – Restrictions on cash and intercompany funds transfers

The business of JPMorgan Chase Bank, National Association ("JPMorgan Chase Bank, N.A.") is subject to examination and regulation by the Office of the Comptroller of the Currency ("OCC"). The Bank is a member of the U.S. Federal Reserve System and its deposits are insured by the Federal Deposit Insurance Corporation ("FDIC").

The Board of Governors of the Federal Reserve System (the "Federal Reserve Board") requires depository institutions to maintain cash reserves with a Federal Reserve Bank. The average amount of reserve balances deposited by the Firm's bank subsidiaries with various Federal Reserve Banks was approximately $1.6 billion in 2007 and $2.2 billion in 2006.

Restrictions imposed by U.S. federal law prohibit JPMorgan Chase and certain of its affiliates from borrowing from banking subsidiaries unless the loans are secured in specified amounts. Such secured loans to the Firm or to other affiliates are generally limited to 10% of the banking subsidiary's total capital, as determined by the risk-based capital guidelines; the aggregate amount of all such loans is limited to 20% of the banking subsidiary's total capital.

The principal sources of JPMorgan Chase's income (on a parent company–only basis) are dividends and interest from JPMorgan Chase Bank, N.A., and the other banking and nonbanking subsidiaries of JPMorgan Chase. In addition to dividend restrictions set forth in statutes and regulations, the Federal Reserve Board, the OCC and the FDIC have authority under the Financial Institutions Supervisory Act to prohibit or to limit the payment of dividends by the banking organizations they supervise, including JPMorgan Chase and its subsidiaries that are banks or bank holding companies, if, in the banking regulator's opinion, payment of a dividend would constitute an unsafe or unsound practice in light of the financial condition of the banking organization.

At January 1, 2008 and 2007, JPMorgan Chase's banking subsidiaries could pay, in the aggregate, $16.3 billion and $14.3 billion, respectively, in dividends to their respective bank holding companies without the prior approval of their relevant banking regulators. The capacity to pay dividends in 2008 will be supplemented by the banking subsidiaries' earnings during the year.

In compliance with rules and regulations established by U.S. and non-U.S. regulators, as of December 31, 2007 and 2006, cash in the amount of $16.0 billion and $8.6 billion, respectively, and securities with a fair value of $3.4 billion and $2.1 billion, respectively, were segregated in special bank accounts for the benefit of securities and futures brokerage customers.

Note 28 – Capital

There are two categories of risk-based capital: Tier 1 capital and Tier 2 capital. Tier 1 capital includes common stockholders' equity, qualifying preferred stock and minority interest less goodwill and other adjustments. Tier 2 capital consists of preferred stock not qualifying as Tier 1, subordinated long-term debt and other instruments qualifying as Tier 2, and the aggregate allowance for credit losses up to a certain percentage of risk-weighted assets. Total regulatory capital is subject to deductions for investments in certain subsidiaries. Under the risk-based capital guidelines of the Federal Reserve Board, JPMorgan Chase is required to maintain minimum ratios of Tier 1 and Total (Tier 1 plus Tier 2) capital to risk weighted assets, as well as minimum leverage ratios (which are defined as Tier 1 capital to average adjusted on–balance sheet assets). Failure to meet these minimum requirements could cause the Federal Reserve Board to take action. Banking subsidiaries also are subject to these capital requirements by their respective primary regulators. As of December 31, 2007 and 2006, JPMorgan Chase and all of its banking subsidiaries were well-capitalized and met all capital requirements to which each was subject.

The following table presents the risk-based capital ratios for JPMorgan Chase and its significant banking subsidiaries at December 31, 2007 and 2006.

(in millions, except ratios)	Tier 1 capital	Total capital	Risk-weighted assets[c]	Adjusted average assets[d]	Tier 1 capital ratio	Total capital ratio	Tier 1 leverage ratio
December 31, 2007[a]							
JPMorgan Chase & Co.	**$ 88,746**	**$ 132,242**	**$ 1,051,879**	**$ 1,473,541**	**8.4%**	**12.6%**	**6.0%**
JPMorgan Chase Bank, N.A.	**78,453**	**112,253**	**950,001**	**1,268,304**	**8.3**	**11.8**	**6.2**
Chase Bank USA, N.A.	**9,407**	**10,720**	**73,169**	**60,905**	**12.9**	**14.7**	**15.5**
December 31, 2006[a]							
JPMorgan Chase & Co.	$ 81,055	$ 115,265	$ 935,909	$ 1,308,699	8.7%	12.3%	6.2%
JPMorgan Chase Bank, N.A.	68,726	96,103	840,057	1,157,449	8.2	11.4	5.9
Chase Bank USA, N.A.	9,242	11,506	77,638	66,202	11.9	14.8	14.0
Well-capitalized ratios[b]					6.0%	10.0%	5.0%[e]
Minimum capital ratios[b]					4.0	8.0	3.0[f]

(a) Asset and capital amounts for JPMorgan Chase's banking subsidiaries reflect intercompany transactions, whereas the respective amounts for JPMorgan Chase reflect the elimination of intercompany transactions.
(b) As defined by the regulations issued by the Federal Reserve Board, OCC and FDIC.
(c) Includes off–balance sheet risk-weighted assets in the amounts of $352.7 billion, $336.8 billion and $13.4 billion, respectively, at December 31, 2007, and $305.3 billion, $290.1 billion and $12.7 billion, respectively, at December 31, 2006, for JPMorgan Chase and its significant banking subsidiaries.
(d) Average adjusted assets for purposes of calculating the leverage ratio include total average assets adjusted for unrealized gains/losses on securities, less deductions for disallowed goodwill and other intangible assets, investments in certain subsidiaries and the total adjusted carrying value of nonfinancial equity investments that are subject to deductions from Tier 1 capital.
(e) Represents requirements for banking subsidiaries pursuant to regulations issued under the Federal Deposit Insurance Corporation Improvement Act. There is no Tier 1 leverage component in the definition of a well-capitalized bank holding company.
(f) The minimum Tier 1 leverage ratio for bank holding companies and banks is 3% or 4% depending on factors specified in regulations issued by the Federal Reserve Board and OCC.

The following table shows the components of the Firm's Tier 1 and Total capital.

December 31, (in millions)	2007	2006
Tier 1 capital		
Total stockholders' equity	**$123,221**	$115,790
Effect of certain items in Accumulated other comprehensive income (loss) excluded from Tier 1 capital	**925**	1,562
Adjusted stockholders' equity	**124,146**	117,352
Minority interest[a]	**15,005**	12,970
Less: Goodwill	**45,270**	45,186
SFAS 157 DVA	**882**	—
Investments in certain subsidiaries	**782**	420
Nonqualifying intangible assets	**3,471**	3,661
Tier 1 capital	**88,746**	81,055
Tier 2 capital		
Long-term debt and other instruments qualifying as Tier 2	**32,817**	26,613
Qualifying allowance for credit losses	**10,084**	7,803
Adjustment for investments in certain subsidiaries and other	**595**	(206)
Tier 2 capital	**43,496**	34,210
Total qualifying capital	**$132,242**	$115,265

(a) Primarily includes trust preferred capital debt securities of certain business trusts.

Note 29 – Commitments and contingencies

At December 31, 2007, JPMorgan Chase and its subsidiaries were obligated under a number of noncancelable operating leases for premises and equipment used primarily for banking purposes. Certain leases contain renewal options or escalation clauses providing for increased rental payments based upon maintenance, utility and tax increases or require the Firm to perform restoration work on leased premises. No lease agreement imposes restrictions on the Firm's ability to pay dividends, engage in debt or equity financing transactions or enter into further lease agreements.

The following table presents required future minimum rental payments under operating leases with noncancelable lease terms that expire after December 31, 2007.

Year ended December 31, (in millions)	
2008	$1,040
2009	1,009
2010	934
2011	850
2012	794
After 2012	6,281
Total minimum payments required[a]	10,908
Less: Sublease rentals under noncancelable subleases	(1,330)
Net minimum payment required	$ 9,578

(a) Lease restoration obligations are accrued in accordance with SFAS 13, and are not reported as a required minimum lease payment.

Total rental expense was as follows.

Year ended December 31, (in millions)	2007	2006	2005
Gross rental expense	**$1,380**	$1,266	$1,239
Sublease rental income	**(175)**	(194)	(192)
Net rental expense	**$1,205**	$1,072	$1,047

At December 31, 2007, assets were pledged to secure public deposits and for other purposes. The significant components of the assets pledged were as follows.

December 31, (in billions)	2007	2006
Reverse repurchase/securities borrowing agreements	**$333.7**	$290.5
Securities	**4.5**	40.0
Loans	**160.4**	117.0
Trading assets and other	**102.2**	108.0
Total assets pledged	**$600.8**	$555.5

The Bank of New York Mellon Corporation ("BNYM"), formerly known as The Bank of New York, has informed the Firm of difficulties in locating certain documentation, including IRS Forms W-8 and W-9, related to certain accounts transferred to BNYM in connection with the Firm's sale of its corporate trust business. The Firm could have liability to the IRS if it is determined that there was noncompliance with IRS tax reporting and withholding requirements, and to BNYM if it is determined that there was noncompliance with the sales agreements. The Firm is working with BNYM to locate and verify documents, and to obtain replacement documentation where necessary. The Firm and BNYM have jointly notified the IRS of the matter and are working cooperatively to address the issues and resolve any outstanding reporting and withholding issues with the IRS. Although the Firm currently does not expect that any amounts payable would be material, it is too early to precisely determine the extent of any potential liability relating to this matter.

Litigation reserve

Insurance recoveries related to certain material legal proceedings were $36 million, $512 million and $208 million in 2007, 2006 and 2005, respectively. Charges related to certain material legal proceedings were $2.8 billion in 2005. There were no charges in 2007 and 2006 related to certain material legal proceedings.

The Firm maintains litigation reserves for certain of its outstanding litigation. In accordance with the provisions of SFAS 5, JPMorgan Chase accrues for a litigation-related liability when it is probable that such a liability has been incurred and the amount of the loss can be reasonably estimated. When the Firm is named a defendant in a litigation and may be subject to joint and several liability and a judgment sharing agreement is in place, the Firm recognizes expense and obligations net of amounts expected to be paid by other signatories to the judgment sharing agreement.

While the outcome of litigation is inherently uncertain, management believes, in light of all information known to it at December 31, 2007, the Firm's litigation reserves were adequate at such date. Management reviews litigation reserves periodically, and the reserves may be increased or decreased in the future to reflect further relevant developments. The Firm believes it has meritorious defenses to the claims asserted against it in its currently outstanding litigation and, with respect to such litigation, intends to continue to defend itself vigorously, litigating or settling cases according to management's judgment as to what is in the best interests of stockholders.

Note 30 – Accounting for derivative instruments and hedging activities

Derivative instruments enable end users to increase, reduce or alter exposure to credit or market risks. The value of a derivative is derived from its reference to an underlying variable or combination of variables such as equity, foreign exchange, credit, commodity or interest rate prices or indices. JPMorgan Chase makes markets in derivatives for customers and also is an end-user of derivatives in order to hedge market exposures, modify the interest rate characteristics of related balance sheet instruments or meet longer-term investment objectives. The majority of the Firm's derivatives are entered into for trading purposes. Both trading and end-user derivatives are recorded at fair value in Trading assets and Trading liabilities as set forth in Note 6 on page 122 of this Annual Report.

Interest rate contracts, which are generally interest rate swaps, forwards and futures are utilized in the Firm's risk management activities in order to minimize significant fluctuations in earnings that are caused by interest rate volatility. As a result of interest rate fluctuations, fixed-rate assets and liabilities appreciate or depreciate in market value. Gains or losses on the derivative instruments that are linked to the fixed-rate assets and liabilities being hedged are expected to substantially offset this unrealized appreciation or depreciation. Interest income and Interest expense on variable-rate assets and liabilities increase or decrease as a result of interest rate fluctuations. Gains and losses on the derivative instruments that are linked to the assets and liabilities being hedged are expected to substantially offset this variability in earnings. Interest rate swaps involve the exchange of fixed-rate and variable-rate interest payments based on the contractual underlying notional amount. Forward contracts used for the Firm's interest rate risk management activities are primarily arrangements to exchange cash in the future based on price movements in securities. Futures contracts used are primarily index futures providing for cash payments based upon the movements of an underlying rate index.

The Firm uses foreign currency contracts to manage the foreign exchange risk associated with certain foreign currency-denominated assets and liabilities, forecasted transactions denominated in a foreign currency, as well as the Firm's equity investments in foreign subsidiaries. As a result of foreign currency fluctuations, the U.S. dollar equivalent values of the foreign currency-denominated assets and liabilities or forecasted transactions change. Gains or losses on the derivative instruments that are linked to the foreign currency denominated assets or liabilities or forecasted transactions being hedged are expected to substantially offset this variability. Foreign exchange forward contracts represent agreements to exchange the currency of one country for the currency of another country at an agreed-upon price on an agreed-upon settlement date.

The Firm uses forward contracts to manage the overall price risk associated with its gold inventory. As a result of gold price fluctuations, the fair value of the gold inventory changes. Gains or losses on the derivative instruments that are linked to the gold inventory being hedged are expected to offset this unrealized appreciation or depreciation. Forward contracts used for the Firm's gold inventory risk management activities are arrangements to deliver gold in the future.

SFAS 133, as amended by SFAS 138, SFAS 149, and SFAS 155, establishes accounting and reporting standards for derivative instruments, including those used for trading and hedging activities, and derivative instruments embedded in other contracts. All free-standing derivatives, whether designated for hedging relationships or not, are required to be recorded on the Consolidated balance sheets at fair value. The accounting for changes in value of a derivative depends on whether the contract is for trading purposes or has been designated and qualifies for hedge accounting.

In order to qualify for hedge accounting, a derivative must be considered highly effective at reducing the risk associated with the exposure being hedged. In order for a derivative to be designated as a hedge, there must be documentation of the risk management objective and strategy, including identification of the hedging instrument, the hedged item and the risk exposure, and how effectiveness is to be assessed prospectively and retrospectively. To assess effectiveness, the Firm uses statistical methods such as regression analysis, as well as nonstatistical methods including dollar value comparisons of the change in the fair value of the derivative to the change in the fair value or cash flows of the hedged item. The extent to which a hedging instrument has been and is expected to continue to be effective at achieving offsetting changes in fair value or cash flows must be assessed and documented at least quarterly. Any ineffectiveness must be reported in current-period earnings. If it is determined that a derivative is not highly effective at hedging the designated exposure, hedge accounting is discontinued.

For qualifying fair value hedges, all changes in the fair value of the derivative and in the fair value of the hedged item for the risk being hedged are recognized in earnings. If the hedge relationship is terminated, then the fair value adjustment to the hedged item continues to be reported as part of the basis of the item and continues to be amortized to earnings as a yield adjustment. For qualifying cash flow hedges, the effective portion of the change in the fair value of the derivative is recorded in Other comprehensive income and recognized in the Consolidated statement of income when the hedged cash flows affect earnings. The ineffective portions of cash flow hedges are immediately recognized in earnings. If the hedge relationship is terminated, then the change in fair value of the derivative recorded in Other comprehensive income is recognized when the cash flows that were hedged occur, consistent with the original hedge strategy. For hedge relationships discontinued because the forecasted transaction is not expected to occur according to the original strategy, any related derivative amounts recorded in Other comprehensive income are immediately recognized in earnings. For qualifying net investment hedges, changes in the fair value of the derivative or the revaluation of the foreign currency–denominated debt instrument are recorded in the translation adjustments account within Other comprehensive income.

JPMorgan Chase's fair value hedges primarily include hedges of fixed-rate long-term debt, warehouse loans, AFS securities, MSRs and gold inventory. Interest rate swaps are the most common type of derivative contract used to modify exposure to interest rate risk, converting fixed-rate assets and liabilities to a floating-rate. Prior to the adoption of SFAS 156, interest rate options, swaptions and forwards were also used in combination with interest rate swaps to hedge the fair value of the Firm's MSRs in SFAS 133 hedge relationships. For a further discussion of MSR risk management activities, see Note 18 on pages 154–156 of this Annual Report. All amounts have been included in earnings consistent with the classification of the hedged item, primarily Net interest income for Long-term debt and AFS securities; Mortgage fees and related income for MSRs, Other income for warehouse loans; and Principal transactions for gold inventory. The Firm did not recognize any gains or losses during 2007, 2006 or 2005 on firm commitments that no longer qualify as fair value hedges.

JPMorgan Chase also enters into derivative contracts to hedge exposure to variability in cash flows from floating-rate financial instruments and forecasted transactions, primarily the rollover of short-term assets and liabilities, and foreign currency–denominated revenue and expense. Interest rate swaps, futures and forward contracts are the most common instruments used to reduce the impact of interest rate and foreign exchange rate changes on future earnings. All amounts affecting earnings have been recognized consistent with the classification of the hedged item, primarily Net interest income.

The Firm uses forward foreign exchange contracts and foreign currency–denominated debt instruments to protect the value of net investments in subsidiaries, the functional currency of which is not the U.S. dollar. The portion of the hedging instruments excluded from the assessment of hedge effectiveness (forward points) is recorded in Net interest income.

The following table presents derivative instrument hedging-related activities for the periods indicated.

Year ended December 31, (in millions)	**2007**	2006	2005
Fair value hedge ineffective net gains/(losses)[a]	**$111**	$51	$(58)
Cash flow hedge ineffective net gains/(losses)[a]	**29**	2	(2)
Cash flow hedging net gains/(losses) on forecasted transactions that failed to occur[b]	**15**	—	—

(a) Includes ineffectiveness and the components of hedging instruments that have been excluded from the assessment of hedge effectiveness.
(b) During the second half of 2007, the Firm did not issue short-term fixed rate Canadian dollar denominated notes due to the weak credit market for Canadian short-term debt.

Over the next 12 months, it is expected that $263 million (after-tax) of net losses recorded in Other comprehensive income at December 31, 2007, will be recognized in earnings. The maximum length of time over which forecasted transactions are hedged is 10 years, and such transactions primarily relate to core lending and borrowing activities.

JPMorgan Chase does not seek to apply hedge accounting to all of the Firm's economic hedges. For example, the Firm does not apply hedge accounting to standard credit derivatives used to manage the credit risk of loans and commitments because of the difficulties in qualifying such contracts as hedges under SFAS 133. Similarly, the Firm does not apply hedge accounting to certain interest rate derivatives used as economic hedges.

Note 31 – Off–balance sheet lending-related financial instruments and guarantees

JPMorgan Chase utilizes lending-related financial instruments (e.g., commitments and guarantees) to meet the financing needs of its customers. The contractual amount of these financial instruments represents the maximum possible credit risk should the counterparty draw down the commitment or the Firm fulfill its obligation under the guarantee, and the counterparty subsequently fail to perform according to the terms of the contract. Most of these commitments and guarantees expire without a default occurring or without being drawn. As a result, the total contractual amount of these instruments is not, in the Firm's view, representative of its actual future credit exposure or funding requirements. Further, certain commitments, primarily related to consumer financings, are cancelable, upon notice, at the option of the Firm.

To provide for the risk of loss inherent in wholesale-related contracts, an allowance for credit losses on lending-related commitments is maintained. See Note 15 on pages 138–139 of this Annual Report for further discussion of the allowance for credit losses on lending-related commitments.

The following table summarizes the contractual amounts of off–balance sheet lending-related financial instruments and guarantees and the related allowance for credit losses on lending-related commitments at December 31, 2007 and 2006.

Off–balance sheet lending-related financial instruments and guarantees

	Contractual amount		Allowance for lending-related commitments	
December 31, (in millions)	**2007**	2006	**2007**	2006
Lending-related				
Consumer[a]	**$ 815,936**	$ 747,535	**$ 15**	$ 25
Wholesale:				
Other unfunded commitments to extend credit[b][c][d][e]	**250,954**	229,204	**571**	305
Asset purchase agreements[f]	**90,105**	67,529	**9**	6
Standby letters of credit and financial guarantees[c][g][h]	**100,222**	89,132	**254**	187
Other letters of credit[c]	**5,371**	5,559	**1**	1
Total wholesale	**446,652**	391,424	**835**	499
Total lending-related	**$ 1,262,588**	$ 1,138,959	**$ 850**	$ 524
Other guarantees				
Securities lending guarantees[i]	**$ 385,758**	$ 318,095	**NA**	NA
Derivatives qualifying as guarantees[j]	**85,262**	71,531	**NA**	NA

(a) Includes credit card and home equity lending-related commitments of $714.8 billion and $74.2 billion, respectively, at December 31, 2007; and $657.1 billion and $69.6 billion, respectively, at December 31, 2006. These amounts for credit card and home equity lending–related commitments represent the total available credit for these products. The Firm has not experienced, and does not anticipate, that all available lines of credit for these products will be utilized at the same time. The Firm can reduce or cancel these lines of credit by providing the borrower prior notice or, in some cases, without notice as permitted by law.
(b) Includes unused advised lines of credit totaling $38.4 billion and $39.0 billion at December 31, 2007 and 2006, respectively, which are not legally binding. In regulatory filings with the Federal Reserve Board, unused advised lines are not reportable.
(c) Represents contractual amount net of risk participations totaling $28.3 billion and $32.8 billion at December 31, 2007 and 2006, respectively.
(d) Excludes unfunded commitments for private third-party equity investments of $881 million and $589 million at December 31, 2007 and 2006, respectively. Also excludes unfunded commitments for other equity investments of $903 million and $943 million at December 31, 2007 and 2006, respectively.
(e) Included in Other unfunded commitments to extend credit are commitments to investment and noninvestment grade counterparties in connection with leveraged acquisitions of $8.2 billion.
(f) Largely represents asset purchase agreements to the Firm's administered multi-seller, asset-backed commercial paper conduits. It also includes $1.1 billion and $1.4 billion of asset purchase agreements to other third-party entities at December 31, 2007 and 2006, respectively.
(g) JPMorgan Chase held collateral relating to $15.8 billion and $13.5 billion of these arrangements at December 31, 2007 and 2006, respectively.
(h) Included unused commitments to issue standby letters of credit of $50.7 billion and $45.7 billion at December 31, 2007 and 2006, respectively.
(i) Collateral held by the Firm in support of securities lending indemnification agreements was $390.5 billion and $317.9 billion at December 31, 2007 and 2006, respectively.
(j) Represents notional amounts of derivatives qualifying as guarantees.

Other unfunded commitments to extend credit

Unfunded commitments to extend credit are agreements to lend only when a customer has complied with predetermined conditions, and they generally expire on fixed dates.

Included in Other unfunded commitments to extend credit are commitments to investment and noninvestment grade borrowers in connection with leveraged acquisitions. These commitments are dependent on whether the acquisition by the borrower is successful, tend to be short-term in nature and, in most cases, are subject to certain conditions based on the borrower's financial condition or other factors. Additionally, the Firm often syndicates portions of the initial position to other investors, depending on market conditions. These commitments generally contain flexible pricing features to adjust for changing market conditions prior to closing. Alternatively, the borrower may turn to the capital markets for required funding instead of drawing on the commitment provided by the Firm, and the commitment may expire unused. As such, these commitments are not necessarily indicative of the Firm's actual risk and the total commitment amount may not reflect actual future cash flow requirements. The amount of these commitments at December 31, 2007, was $8.2 billion. For further information, see Note 4 and Note 5 on pages 111–118 and 119–121, respectively, of this Annual Report.

FIN 45 guarantees

FIN 45 establishes accounting and disclosure requirements for guarantees, requiring that a guarantor recognize, at the inception of a guarantee, a liability in an amount equal to the fair value of the obligation undertaken in issuing the guarantee. FIN 45 defines a guarantee as a contract that contingently requires the guarantor to pay a guaranteed party, based upon: (a) changes in an underlying asset, liability or equity security of the guaranteed party; or (b) a third party's failure to perform under a specified agreement. The Firm considers the following off–balance sheet lending arrangements to be guarantees under FIN 45: certain asset purchase agreements, standby letters of credit and financial guarantees, securities lending indemnifications, certain indemnification agreements included within third-party contractual arrangements and certain derivative contracts. These guarantees are described in further detail below.

The fair value at inception of the obligation undertaken when issuing the guarantees and commitments that qualify under FIN 45 is typically equal to the net present value of the future amount of premium receivable under the contract. The Firm has recorded this amount in Other Liabilities with an offsetting entry recorded in Other Assets. As cash is received under the contract, it is applied to the premium receivable recorded in Other Assets, and the fair value of the liability recorded at inception is amortized into income as Lending & deposit-related fees over the life of the guarantee contract. The amount of the liability related to FIN 45 guarantees recorded at December 31, 2007 and 2006, excluding the allowance for credit losses on lending-related commitments and derivative contracts discussed below, was approximately $335 million and $297 million, respectively.

Asset purchase agreements

The majority of the Firm's unfunded commitments are not guarantees as defined in FIN 45, except for certain asset purchase agreements that are principally used as a mechanism to provide liquidity to SPEs, primarily multi-seller conduits, as described in Note 17 on pages 146–154 of this Annual Report. The conduit's administrative agent can require the liquidity provider to perform under their asset purchase agreement with the conduit at any time. These agreements may cause the Firm to purchase an asset from the SPE at an amount above the asset's then fair value, in effect providing a guarantee of the initial value of the reference asset as of the date of the agreement. In most instances, third-party credit enhancements of the SPE mitigate the Firm's potential losses on these agreements.

Standby letters of credit and financial guarantees

Standby letters of credit and financial guarantees are conditional lending commitments issued by JPMorgan Chase to guarantee the performance of a customer to a third party under certain arrangements, such as commercial paper facilities, bond financings, acquisition financings, trade and similar transactions. Approximately 50% of these arrangements mature within three years. The Firm typically has recourse to recover from the customer any amounts paid under these guarantees; in addition, the Firm may hold cash or other highly liquid collateral to support these guarantees.

Securities lending indemnification

Through the Firm's securities lending program, customers' securities, via custodial and non-custodial arrangements, may be lent to third parties. As part of this program, the Firm issues securities lending indemnification agreements to the lender which protects it principally against the failure of the third-party borrower to return the lent securities. To support these indemnification agreements, the Firm obtains cash or other highly liquid collateral with a market value exceeding 100% of the value of the securities on loan from the borrower. Collateral is marked to market daily to help assure that collateralization is adequate. Additional collateral is called from the borrower if a shortfall exists or released to the borrower in the event of overcollateralization. If an indemnifiable default by a borrower occurs, the Firm would expect to use the collateral held to purchase replacement securities in the market or to credit the lending customer with the cash equivalent thereof.

Also, as part of this program, the Firm invests cash collateral received from the borrower in accordance with approved guidelines. On an exception basis the Firm may indemnify the lender against this investment risk when certain types of investments are made.

Based upon historical experience, management believes that these risks of loss are remote.

Indemnification agreements – general

In connection with issuing securities to investors, the Firm may enter into contractual arrangements with third parties that may require the Firm to make a payment to them in the event of a change in tax law or an adverse interpretation of tax law. In certain cases, the contract also may include a termination clause, which would allow the Firm to settle the contract at its fair value; thus, such a clause would not require the Firm to make a payment under the indemnification agreement. Even without the termination clause, management does not expect such indemnification agreements to have a material adverse effect on the consolidated financial condition of JPMorgan Chase. See below for more information regarding the Firm's loan securitization activities. The Firm may also enter into indemnification clauses in connection with the licensing of software to clients ("software licensees") or when it sells a business or assets to a third party ("third-party purchasers"), pursuant to which it indemnifies software licensees for claims of liability or damage that may occur subsequent to the licensing of the software, or third-party purchasers for losses they may incur due to actions taken by the Firm prior to the sale of the business or assets. It is difficult to estimate the Firm's maximum exposure under these indemnification arrangements, since this would require an assessment of future changes in tax law and future claims that may be made against the Firm that have not yet occurred. However, based upon historical experience, management expects the risk of loss to be remote.

Securitization-related indemnifications

As part of the Firm's loan securitization activities, as described in Note 16 on pages 139–145 of this Annual Report, the Firm provides representations and warranties that certain securitized loans meet specific requirements. The Firm may be required to repurchase the loans and/or indemnify the purchaser of the loans against losses due to any breaches of such representations or warranties. Generally, the maximum amount of future payments the Firm would be required to make under such repurchase and/or indemnification provisions would be equal to the current amount of assets held by such securitization-related SPEs as of December 31, 2007, plus, in certain circumstances, accrued and unpaid interest on such loans and certain expense. The potential loss due to such repurchase and/or indemnity is mitigated by the due diligence the Firm performs before the sale to ensure that the assets comply with the requirements set forth in the representations and warranties. Historically, losses incurred on such repurchases and/or indemnifications have been insignificant, and therefore management expects the risk of material loss to be remote.

Credit card charge-backs

The Firm is a partner with one of the leading companies in electronic payment services in a joint venture operating under the name of Chase Paymentech Solutions, LLC (the "joint venture"). The joint venture was formed in October 2005, as a result of an agreement by the Firm and First Data Corporation, its joint venture partner, to integrate the companies' jointly owned Chase Merchant Services and Paymentech merchant businesses. The joint venture provides merchant processing services in the United States and Canada. Under the rules of Visa USA, Inc., and Mastercard International, JPMorgan Chase Bank, N.A., is liable primarily for the amount of each processed credit card sales transaction that is the subject of a dispute between a cardmember and a merchant. The joint venture is contractually liable to JPMorgan Chase Bank, N.A., for these disputed transactions. If a dispute is resolved in the cardmember's favor, the joint venture will (through the cardmember's issuing bank) credit or refund the amount to the cardmember and will charge back the transaction to the merchant. If the joint venture is unable to collect the amount from the merchant, the joint venture will bear the loss for the amount credited or refunded to the cardmember. The joint venture mitigates this risk by withholding future settlements, retaining cash reserve accounts or by obtaining other security. However, in the unlikely event that: (1) a merchant ceases operations and is unable to deliver products, services or a refund; (2) the joint venture does not have sufficient collateral from the merchant to provide customer refunds; and (3) the joint venture does not have sufficient financial resources to provide customer refunds, JPMorgan Chase Bank, N.A., would be liable for the amount of the transaction, although it would have a contractual right to recover from its joint venture partner an amount proportionate to such partner's equity interest in the joint venture. For the year ended December 31, 2007, the joint venture incurred aggregate credit losses of $10 million on $719.1 billion of aggregate volume processed. At December 31, 2007, the joint venture held $779 million of collateral. For the year ended December 31, 2006, the joint venture incurred aggregate credit losses of $9 million on $660.6 billion of aggregate volume processed. At December 31, 2006, the joint venture held $893 million of collateral. The Firm believes that, based upon historical experience and the collateral held by the joint venture, the fair value of the Firm's chargeback-related obligations would not be different materially from the credit loss allowance recorded by the joint venture; therefore, the Firm has not recorded any allowance for losses in excess of the allowance recorded by the joint venture.

Exchange, clearinghouse and credit card association guarantees

The Firm is a member of several securities and futures exchanges and clearinghouses, both in the United States and other countries. Membership in some of these organizations requires the Firm to pay a pro rata share of the losses incurred by the organization as a result of the default of another member. Such obligations vary with different organizations. These obligations may be limited to members who dealt with the defaulting member or to the amount (or a multiple of the amount) of the Firm's contribution to a members' guaranty fund, or, in a few cases, the obligation may be unlimited. It is difficult to estimate the Firm's maximum exposure under these membership agreements, since this would require an assessment of future claims that may be made against the Firm that have not yet occurred. However, based upon historical experience, management expects the risk of loss to be remote.

The Firm is an equity member of VISA Inc. During October 2007, certain VISA related entities completed a series of restructuring transactions to combine their operations, including VISA USA, under one holding company, VISA Inc. Upon the restructuring, the Firm's membership interest in VISA USA was converted into an equity interest in VISA Inc. VISA Inc. intends to issue and sell shares via an initial public offering and to use a portion of the proceeds from the offering to redeem a portion of the Firm's equity interest in Visa Inc.

Prior to the restructuring, VISA USA's by-laws obligated the Firm upon demand by VISA to indemnify VISA for, among other things, litigation obligations of Visa. The accounting for that guarantee was not subject to fair value accounting under FIN 45 because the guarantee was in effect prior to the effective date of FIN 45. Upon the restructuring event, the Firm's obligation to indemnify Visa was limited to certain identified litigations. Such a limitation is deemed a modification of the indemnity by-law and, accordingly, is now subject to the provisions of FIN 45. The value of the litigation guarantee has been recorded in the Firm's financial statements based on its fair value; the net amount recorded (within Other Liabilities) did not have a material adverse effect on the Firm's financial statements.

Derivative guarantees

In addition to the contracts described above, there are certain derivative contracts to which the Firm is a counterparty that meet the characteristics of a guarantee under FIN 45. These derivatives are recorded on the Consolidated balance sheets at fair value. These contracts include written put options that require the Firm to purchase assets from the option holder at a specified price by a specified date in the future, as well as derivatives that effectively guarantee the return on a counterparty's reference portfolio of assets. The total notional value of the derivatives that the Firm deems to be guarantees was $85.3 billion and $71.5 billion at December 31, 2007 and 2006, respectively. The Firm reduces exposures to these contracts by entering into offsetting transactions or by entering into contracts that hedge the market risk related to these contracts. The fair value related to these contracts was a derivative receivable of $213 million and $230 million, and a derivative payable of $2.5 billion and $987 million at December 31, 2007 and 2006, respectively.

Finally, certain written put options and credit derivatives permit cash settlement and do not require the option holder or the buyer of credit protection to own the reference asset. The Firm does not consider these contracts to be guarantees under FIN 45.

Note 32 – Credit risk concentrations

Concentrations of credit risk arise when a number of customers are engaged in similar business activities or activities in the same geographic region, or when they have similar economic features that would cause their ability to meet contractual obligations to be similarly affected by changes in economic conditions.

JPMorgan Chase regularly monitors various segments of its credit portfolio to assess potential concentration risks and to obtain collateral when deemed necessary. In the Firm's wholesale portfolio, risk concentrations are evaluated primarily by industry and by geographic region. In the consumer portfolio, concentrations are evaluated primarily by product and by U.S. geographic region.

The Firm does not believe exposure to any one loan product with varying terms (e.g., interest-only payments for an introductory period) or exposure to loans with high loan-to-value ratios would result in a significant concentration of credit risk. Terms of loan products and collateral coverage are included in the Firm's assessment when extending credit and establishing its Allowance for loan losses.

For further information regarding on–balance sheet credit concentrations by major product and geography, see Note 14 on page 137 of this Annual Report. For information regarding concentrations of off–balance sheet lending-related financial instruments by major product, see Note 31 on pages 170–173 of this Annual Report. More information about concentrations can be found in the following tables or discussion in the Management's Discussion and Analysis.

Total consumer–related	**1,122.2**	**306.3**	**815.9**	1,046.9	299.4	747.5
Total exposure	**$1,859.1**	**$ 596.5**	**$1,262.6**	$ 1,677.7	$ 538.8	$ 1,138.9

(a) Excludes $72.7 billion and $67.0 billion of securitized credit card receivables at December 31, 2007 and 2006, respectively.
(b) Includes loans held-for-sale and loans at fair value.
(c) Represents loans and derivative receivables.
(d) Represents lending-related financial instruments.

Note 33 – International operations

The following table presents income statement information of JPMorgan Chase by major geographic area. The Firm defines international activities as business transactions that involve customers residing outside of the U.S., and the information presented below is based primarily upon the domicile of the customer or the location from which the customer relationship is managed. However, many of the Firm's U.S. operations serve international businesses.

As the Firm's operations are highly integrated, estimates and subjective assumptions have been made to apportion revenue and expense between U.S. and international operations. These estimates and assumptions are consistent with the allocations used for the Firm's segment reporting as set forth in Note 34 on pages 175–177 of this Annual Report.

The Firm's long-lived assets for the periods presented are not considered by management to be significant in relation to total assets. The majority of the Firm's long-lived assets are located in the U.S.

Year ended December 31, (in millions)	Revenue[a]	Expense[b]	Income from continuing operations before income taxes	Net income
2007				
Europe/Middle East and Africa	**$ 12,070**	**$ 8,445**	**$ 3,625**	**$ 2,585**

Total	$ 54,248	$ 42,409	$ 11,839	$ 8,483

(a) Revenue is composed of Net interest income and Noninterest revenue.
(b) Expense is composed of Noninterest expense and Provision for credit losses.

Note 34 – Business segments

JPMorgan Chase is organized into six major reportable business segments — Investment Bank, Retail Financial Services, Card Services, Commercial Banking, Treasury & Securities Services and Asset Management, as well as a Corporate segment. The segments are based upon the products and services provided or the type of customer served, and they reflect the manner in which financial information is currently evaluated by management. Results of these lines of business are presented on a managed basis. For a definition of managed basis, see Explanation and Reconciliation of the Firm's use of non-GAAP financial measures, on pages 36–37 of this Annual Report. For a further discussion concerning JPMorgan Chase's business segments, see Business segment results on pages 38–39 of this Annual Report.

Business segment financial disclosures

Capital allocation changes

Effective January 1, 2006, the Firm refined its methodology for allocating capital (i.e., equity) to the business segments. As a result of this refinement, RFS, CS, CB, TSS and AM have higher amounts of capital allocated to them commencing in the first quarter of 2006. The revised methodology considers for each line of business, among other things, goodwill associated with such business segment's acquisitions since the Merger. In management's view, the revised methodology assigns responsibility to the lines of business to generate returns on the amount of capital supporting acquisition-related goodwill. As part of this refinement in the capital allocation methodology, the Firm assigned to the Corporate segment an amount of equity capital equal to the then-current book value of goodwill from and prior to the Merger. As prior periods have not been revised to reflect the new capital allocations, capital allocated to the respective lines of business for 2005 is not comparable to subsequent periods and certain business metrics, such as return on common equity, are not comparable to the current presentation. The Firm may revise its equity capital allocation methodology again in the future.

Discontinued operations

As a result of the transaction with The Bank of New York, selected corporate trust businesses have been transferred from TSS to the Corporate segment and reported in discontinued operations for all periods reported.

Segment results

The following table provides a summary of the Firm's segment results for 2007, 2006 and 2005 on a managed basis. The impact of credit card securitizations and tax-equivalent adjustments have been included in Reconciling items so that the total Firm results are on a reported basis.

Return on average equity	**15%**	18%	18%	**19%**	22%	26%	**21%**	23%	16%	**17%**	18%	28%
Overhead ratio	**72**	68	68	**57**	60	58	**32**	34	33	**48**	52	53

(a) In addition to analyzing the Firm's results on a reported basis, management reviews the Firm's lines' of business results on a "managed basis," which is a non-GAAP financial measure. The Firm's definition of managed basis starts with the reported U.S. GAAP results and includes certain reclassifications that do not have any impact on Net income as reported by the lines of business or by the Firm as a whole.

(b) TSS reimburses the IB for credit portfolio exposures the IB manages on behalf of clients the segments share.

(c) Includes Merger costs which are reported in the Corporate segment. Merger costs attributed to the business segments for 2007, 2006 and 2005 were as follows.

Year ended December 31, (in millions)	**2007**	2006	2005
Investment Bank	**$ (2)**	$ 2	$ 32
Retail Financial Services	**14**	24	133
Card Services	**(1)**	29	222
Commercial Banking	**(1)**	1	3
Treasury & Securities Services	**121**	117	95
Asset Management	**20**	23	60
Corporate	**58**	109	177

(d) Managed results for CS exclude the impact of credit card securitizations on Total net revenue, Provision for credit losses and Average assets, as JPMorgan Chase treats the sold receivables as if they were still on the balance sheet in evaluating credit performance and the overall performance of CS' entire managed credit card portfolio as operations are funded, and decisions are made about allocating resources such as employees and capital, based upon managed information. These adjustments are eliminated in Reconciling items to arrive at the Firm's reported U.S. GAAP results. The related securitization adjustments were as follows.

Year ended December 31, (in millions)	**2007**	2006	2005
Noninterest revenue	**$ (3,255)**	$ (3,509)	$ (2,718)
Net interest income	**5,635**	5,719	6,494
Provision for credit losses	**2,380**	2,210	3,776
Average assets	**66,780**	65,266	67,180

(table continued from previous page)

(e) Segment managed results reflect revenue on a tax-equivalent basis with the corresponding income tax impact recorded within Income tax expense. These adjustments are eliminated in Reconciling items to arrive at the Firm's reported U.S. GAAP results. Tax-equivalent adjustments were as follows for the years ended December 31, 2007, 2006 and 2005.

Year ended December 31, (in millions)	**2007**	2006	2005
Noninterest income	**$ 683**	$ 676	$ 571
Net interest income	**377**	228	269
Income tax expense	**1,060**	904	840

Note 35 – Parent company

(a) Subsidiaries include trusts that issued guaranteed capital debt securities ("issuer trusts"). As a result of FIN 46R, the Parent deconsolidated these trusts in 2003. The Parent received dividends of $18 million, $23 million and $21 million from the issuer trusts in 2007, 2006 and 2005, respectively. For further discussion on these issuer trusts, see Note 21 on page 160 of this Annual Report.

(b) At December 31, 2007, debt that contractually matures in 2008 through 2012 totaled $17.8 billion, $17.5 billion, $13.3 billion, $9.5 billion and $12.8 billion, respectively.

(a) The Firm adopted SFAS 157 in the first quarter of 2007. See Note 4 on pages 111–118 of this Annual Report for additional information.

(b) For certain trading-related positions, amounts have been revised between Noninterest revenue and Net interest income; there is no impact to Net revenue as a result of these revisions.

(c) On October 1, 2006, JPMorgan Chase & Co. completed the exchange of selected corporate trust businesses for the consumer, business banking and middle-market banking businesses of The Bank of New York Company Inc. The results of operations of these corporate trust businesses are reported as discontinued operations for each 2006 period.

(d) JPMorgan Chase's common stock is listed and traded on the New York Stock Exchange, the London Stock Exchange Limited and the Tokyo Stock Exchange. The high, low and closing prices of JPMorgan Chase's common stock are from The New York Stock Exchange Composite Transaction Tape.

(e) Excludes purchased wholesale loans held-for-sale.

(f) End-of-period and average Loans held-for-sale and loans at fair value were excluded when calculating the allowance coverage ratios and net charge-off rates, respectively.

(a) The Firm adopted SFAS 157 in the first quarter of 2007. See Note 4 on pages 111–118 of this Annual Report for additional information.

(b) On October 1, 2006, JPMorgan Chase & Co. completed the exchange of selected corporate trust businesses for the consumer, business banking and middle-market banking businesses of The Bank of New York Company Inc. The results of operations of these corporate trust businesses are reported as discontinued operations for each period prior to 2007.

(c) JPMorgan Chase's common stock is listed and traded on the New York Stock Exchange, the London Stock Exchange Limited and the Tokyo Stock Exchange. The high, low and closing prices of JPMorgan Chase's common stock are from The New York Stock Exchange Composite Transaction Tape.

(d) Excludes purchased wholesale loans held-for-sale.

(e) End-of-period and average Loans held-for-sale and loans at fair value were excluded when calculating the allowance coverage ratios and net charge-off rates, respectively.

(f) On July 1, 2004, Bank One Corporation merged with and into JPMorgan Chase. Accordingly, 2004 results include six months of the combined Firm's results and six months of heritage JPMorgan Chase results.

ACH: Automated Clearing House.

AICPA: American Institute of Certified Public Accountants.

AICPA Statement of Position ("SOP") 07-1: "Clarification of the Scope of the Audit and Accounting Guide Investment Companies and Accounting by Parent Companies and Equity Method Investors for Investments in Investment Companies."

AICPA Statement of Position ("SOP") 98-1: "Accounting for the Costs of Computer Software Developed or Obtained for Internal Use."

APB 25: Accounting Principles Board Opinion No. 25. "Accounting for Stock Issued to Employees."

Advised lines of credit: An authorization which specifies the maximum amount of a credit facility the Firm has made available to an obligor on a revolving but non-binding basis. The borrower receives written or oral advice of this facility. The Firm may cancel this facility at any time.

Assets under management: Represent assets actively managed by Asset Management on behalf of institutional, private banking, private client services and retail clients. Excludes assets managed by American Century Companies, Inc., in which the Firm has a 44% ownership interest as of December 31, 2007

Assets under supervision: Represent assets under management as well as custody, brokerage, administration and deposit accounts.

Average managed assets: Refers to total assets on the Firm's Consolidated balance sheets plus credit card receivables that have been securitized.

Beneficial interest issued by consolidated VIEs: Represents the interest of third-party holders of debt/equity securities, or other obligations, issued by VIEs that JPMorgan Chase consolidates under FIN 46R. The underlying obligations of the VIEs consist of short-term borrowings, commercial paper and long-term debt. The related assets consist of trading assets, available-for-sale securities, loans and other assets.

Benefit obligation: Refers to the projected benefit obligation for pension plans and the accumulated postretirement benefit obligation for OPEB plans.

Contractual credit card charge-off: In accordance with the Federal Financial Institutions Examination Council policy, credit card loans are charged off by the end of the month in which the account becomes 180 days past due or within 60 days from receiving notification of the filing of bankruptcy, whichever is earlier.

Credit card securitizations: Card Services' managed results excludes the impact of credit card securitizations on Total net revenue, the Provision for credit losses, net charge-offs and Loan receivables. Through securitization, the Firm transforms a portion of its credit card receivables into securities, which are sold to investors. The credit card receivables are removed from the Consolidated balance sheets through the transfer of the receivables to a trust, and the sale of undivided interests to investors that entitle the investors to specific cash flows generated from the credit card receivables. The Firm retains the remaining undivided interests as seller's interests, which are recorded in Loans on the Consolidated balance sheets. A gain or loss on the sale of credit card receivables to investors is recorded in Other Income. Securitization also affects the Firm's Consolidated statements of income as the aggregate amount of interest income, certain fee revenue and recoveries that is in excess of the aggregate amount of interest paid to the investors, gross credit losses and other trust expense related to the securitized receivables are reclassified into Credit card income in the Consolidated statements of income.

Credit derivatives: Contractual agreements that provide protection against a credit event on one or more referenced credits. The nature of a credit event is established by the protection buyer and protection seller at the inception of a transaction, and such events include bankruptcy, insolvency or failure to meet payment obligations when due. The buyer of the credit derivative pays a periodic fee in return for a payment by the protection seller upon the occurrence, if any, of a credit event.

Credit cycle: A period of time over which credit quality improves, deteriorates and then improves again. The duration of a credit cycle can vary from a couple of years to several years.

Discontinued operations: A component of an entity that is classified as held-for-sale or that has been disposed of from ongoing operations in its entirety or piecemeal, and for which the entity will not have any significant, continuing involvement. A discontinued operation may be a separate major business segment, a component of a major business segment or a geographical area of operations of the entity that can be separately distinguished operationally and for financial reporting purposes.

EITF: Emerging Issues Task Force.

EITF Issue 06-11: "Accounting for Income Tax Benefits of Dividends on Share-Based Payment Awards."

EITF Issue 02-3: "Issues Involved in Accounting for Derivative Contracts Held for Trading Purposes and Contracts Involved in Energy Trading and Risk Management Activities."

EITF Issue 99-20: "Recognition of Interest Income and Impairment on Purchased and Retained Beneficial Interests in Securitized Financial Assets."

FASB: Financial Accounting Standards Board.

FIN 39: FASB Interpretation No. 39, "Offsetting of Amounts Related to Certain Contracts – an interpretation of APB Opinion No. 10 and FASB Statement No. 105."

FIN 41: FASB Interpretation No. 41, "Offsetting of Amounts Related to Certain Repurchase and Reverse Repurchase Agreements – an interpretation of APB Opinion No. 10 and a Modification of FASB Interpretation No. 39."

FIN 45: FASB Interpretation No. 45, "Guarantor's Accounting and Disclosure Requirements for Guarantees, including Indirect Guarantees of Indebtedness of Others – an interpretation of FASB Statements No. 5, 57 and 107 and a rescission of FASB Interpretation No. 34."

FIN 46R: FASB Interpretation No. 46 (revised December 2003), "Consolidation of Variable Interest Entities – an interpretation of ARB No. 51."

FIN 47: FASB Interpretation No. 47, "Accounting for Conditional Asset Retirement Obligations – an interpretation of FASB Statement No. 143."

FIN 48: FASB Interpretation No. 48, "Accounting for Uncertainty in Income Taxes – an interpretation of FASB Statement No. 109."

Forward points: Represents the interest rate differential between two currencies, which is either added to or subtracted from the current exchange rate (i.e., "spot rate") to determine the forward exchange rate.

FSP: FASB Staff Position.

FSP FAS 123(R)-3: "Transition Election Related to Accounting for the Tax Effects of Share-Based Payment Awards."

FSP FAS 13-2: "Accounting for a Change or Projected Change in the Timing of Cash Flows Relating to Income Taxes Generated by a Leveraged Lease Transaction."

FSP FIN 39-1: "Amendment of FASB Interpretation No. 39."

FSP FIN 46(R)-7: "Application of FASB Interpretation No. 46(R) to Investment Companies."

Interchange income: A fee that is paid to a credit card issuer in the clearing and settlement of a sales or cash advance transaction.

Interests in purchased receivables: Represent an ownership interest in cash flows of an underlying pool of receivables transferred by a third-party seller into a bankruptcy-remote entity, generally a trust.

Investment-grade: An indication of credit quality based upon JPMorgan Chase's internal risk assessment system. "Investment-grade" generally represents a risk profile similar to a rating of a "BBB-"/"Baa3" or better, as defined by independent rating agencies.

Managed basis: A non-GAAP presentation of financial results that includes reclassifications related to credit card securitizations and to present revenue on a fully taxable-equivalent basis. Management uses this non-GAAP financial measure at the segment level because it believes this provides information to enable investors to understand the underlying operational performance and trends of the particular business segment and facilitates a comparison of the business segment with the performance of competitors.

Managed credit card receivables: Refers to credit card receivables on the Firm's Consolidated balance sheets plus credit card receivables that have been securitized.

Mark-to-market exposure: A measure, at a point in time, of the value of a derivative or foreign exchange contract in the open market. When the mark-to-market value is positive, it indicates the counterparty owes JPMorgan Chase and, therefore, creates a repayment risk for the Firm. When the mark-to-market value is negative, JPMorgan Chase owes the counterparty; in this situation, the Firm does not have repayment risk.

Master netting agreement: An agreement between two counterparties that have multiple derivative contracts with each other that provides for the net settlement of all contracts through a single payment, in a single currency, in the event of default on or termination of any one contract. See FIN 39.

MSR risk management revenue: Includes changes in MSR asset fair value due to inputs or assumptions in model and derivative valuation adjustments.

Material legal proceedings: Refers to certain specific litigation originally discussed in the section "Legal Proceedings" in the Firm's Annual Report on Form 10-K for the year ended December 31, 2002. Of such legal proceedings, some lawsuits related to Enron and the IPO allocation allegations remain outstanding as of the date of this Annual Report, as discussed in Part I, Item 3, Legal proceedings in the Firm's Annual Report on Form 10-K for the year ended December 31, 2007, to which reference is hereby made; other such legal proceedings have been resolved.

Merger: On July 1, 2004, Bank One Corporation merged with and into JPMorgan Chase.

NA: Data is not applicable or available for the period presented.

Net yield on interest-earning assets: The average rate for interest-earning assets less the average rate paid for all sources of funds.

NM: Not meaningful.

OPEB: Other postretirement employee benefits.

Overhead ratio: Noninterest expense as a percentage of Total net revenue.

Portfolio activity: Describes changes to the risk profile of existing lending-related exposures and their impact on the allowance for credit losses from changes in customer profiles and inputs used to estimate the allowances.

Principal transactions (revenue): Realized and unrealized gains and losses from trading activities (including physical commodities inventories that are accounted for at the lower of cost or fair value) and changes in fair value associated with financial instruments held by the Investment Bank for which the SFAS 159 fair value option was elected. Principal transactions revenue also include private equity gains and losses.

REMIC: Investment vehicles that hold commercial and residential mortgages in trust, and issues securities representing an undivided interest in these mortgages. A REMIC, which can be a corporation, trust, association, or partnership, assembles mortgages into pools and issues pass-through certificates, multiclass bonds similar to a collateralized mortgage obligation (CMO), or other securities to investors in the secondary mortgage market.

Reported basis: Financial statements prepared under accounting principles generally accepted in the United States of America ("U.S. GAAP"). The reported basis includes the impact of credit card securitizations, but excludes the impact of taxable-equivalent adjustments.

Return on common equity less goodwill: Represents net income applicable to common stock divided by total average common equity (net of goodwill). The Firm uses return on common equity less goodwill, a non-GAAP financial measure, to evaluate the operating performance of the Firm. The Firm also utilizes this measure to facilitate operating comparisons to other competitors.

SAB: Staff Accounting Bulletin

SAB 109: "Written Loan Commitments Recorded at Fair Value Through Earnings."

SFAS: Statement of Financial Accounting Standards.

SFAS 5: "Accounting for Contingencies."

SFAS 13: "Accounting for Leases."

SFAS 52: "Foreign Currency Translation."

SFAS 87: "Employers' Accounting for Pensions."

SFAS 88: "Employers' Accounting for Settlements and Curtailments of Defined Benefit Pension Plans and for Termination Benefits."

SFAS 106: "Employers' Accounting for Postretirement Benefits Other Than Pensions."

SFAS 107: "Disclosures about Fair Value of Financial Instruments."

SFAS 109: "Accounting for Income Taxes."

SFAS 114: "Accounting by Creditors for Impairment of a Loan – an amendment of FASB Statements No. 5 and 15."

SFAS 115: "Accounting for Certain Investments in Debt and Equity Securities."

SFAS 123: "Accounting for Stock-Based Compensation."

SFAS 123R: "Share-Based Payment."

SFAS 128: "Earnings per Share."

SFAS 133: "Accounting for Derivative Instruments and Hedging Activities."

SFAS 138: "Accounting for Certain Derivative Instruments and Certain Hedging Activities – an amendment of FASB Statement No. 133."

SFAS 140: "Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities – a replacement of FASB Statement No. 125."

SFAS 141R: "Business Combinations"

SFAS 142: "Goodwill and Other Intangible Assets."

SFAS 143: "Accounting for Asset Retirement Obligations."

SFAS 149: "Amendment of Statement No. 133 on Derivative Instruments and Hedging Activities."

SFAS 155: "Accounting for Certain Hybrid Financial Instruments – an amendment of FASB Statements No. 133 and 140."

SFAS 156: "Accounting for Servicing of Financial Assets – an amendment of FASB Statement No. 140."

SFAS 157: "Fair Value Measurements."

SFAS 158: "Employers' Accounting for Defined Benefit Pension and Other Postretirement Plans – an amendment of FASB Statements No. 87, 88, 106, and 132(R)."

SFAS 159: "The Fair Value Option for Financial Assets and Financial Liabilities – Including an amendment of FASB Statement No. 115."

SFAS 160: "Noncontrolling Interests in Consolidated Financial Statements – an amendment of ARB No. 51."

Stress testing: A scenario that measures market risk under unlikely but plausible events in abnormal markets.

Subprime loans: Although a standard definition for Subprime loans (including subprime mortgage loans) does not exist, the Firm defines subprime loans as specific product offerings for higher risk borrowers, including individuals with one or a combination of high credit risk factors, such as low FICO scores (generally less than 620 for secured products and 660 for unsecured products) and high debt to income ratios. The Firm also evaluates the types and severity of historical delinquencies in evaluating whether a subprime product is appropriate for a particular customer. Higher interest rates and additional fees are typically assessed for subprime loans to compensate for the increased credit risk associated with these types of products.

Transactor loan: Loan in which the outstanding balance is paid in full by payment due date.

Unaudited: Financial statements and information that have not been subjected to auditing procedures sufficient to permit an independent certified public accountant to express an opinion.

U.S. GAAP: Accounting principles generally accepted in the United States of America.

U.S. government and federal agency obligations: Obligations of the U.S. government or an instrumentality of the U.S. government whose obligations are fully and explicitly guaranteed as to the timely payment of principal and interest by the full faith and credit of the U.S. government.

U.S. government-sponsored enterprise obligations: Obligations of agencies originally established or chartered by the U.S. government to serve public purposes as specified by the U.S. Congress; these obligations are not explicitly guaranteed as to the timely payment of principal and interest by the full faith and credit of the U.S. government.

Value-at-risk ("VAR"): A measure of the dollar amount of potential loss from adverse market moves in an ordinary market environment.

(a) Results are presented in accordance with accounting principles generally accepted in the United States of America.

JPMorgan Chase & Co. (NYSE: JPM) is a leading global financial services firm with assets of $2.2 trillion and operations in more than 60 countries. The firm is a leader in investment banking, financial services for consumers, small business and commercial banking, financial transaction processing, asset management and private equity. A component of the Dow Jones Industrial Average, JPMorgan Chase serves millions of consumers in the United States and many of the world's most prominent corporate, institutional and government clients under its J.P. Morgan and Chase brands.

Information about J.P. Morgan capabilities can be found at www.jpmorgan.com and about Chase capabilities at www.chase.com. Information about the firm is available at www.jpmorganchase.com.

We do our best to manage and operate our company with a consistent set of business principles and core values. First and foremost, this means always trying to do the right thing.

It means continuing to focus on maintaining a fortress balance sheet, strong capital ratios and strong credit ratings. It means being willing to sacrifice short-term growth for long-term opportunity. During these turbulent times, this approach is vital.

As we move forward, we believe that shareholders will benefit as we do the right thing for our customers and the communities we serve.

While we haven't avoided every obstacle, we're proud our clients have been able to rely on our relative strength and stability during these tough economic times.

We will continue to provide creditworthy businesses of all sizes the capital and financial tools they need to drive growth.

For individuals and families, we will continue to help with their credit, savings and investment needs. This means helping our customers put a roof over their heads, pay for their education and build their small businesses. And, as always, we will adhere to safe and sound lending standards.

With our core beliefs as our foundation, we will do our part to restore our financial system, strengthen the vitality of our company and help move us all forward.

DEAR FELLOW SHAREHOLDERS,

Jamie Dimon,
Chairman and
Chief Executive Officer

In last year's shareholder letter, I referred to the "turbulence" and "unprecedented" nature of events that had taken place during the preceding months. We did not know when the cycle would end or the extent of the damage it would cause. But we did know that we had to "prepare for a severe economic downturn." Collectively, we resolved to navigate through the tough conditions, to help our clients in every way we could and to show leadership in the industry, as has been our legacy during times of crisis.

It is now a year later. What transpired was largely unprecedented and virtually inconceivable. Our firm tried to meet every challenge, and, in the process, we distinguished ourselves in our service to clients and communities. Although our financial results were weak in absolute terms (but fairly good in relative terms), reflecting terrible market conditions, I believe—and I hope you agree—that this year may have been one of our finest.

The way forward will not be easy. We do not know what the future will bring, but we do know that it will require everyone—the banks, the regulators and the government—to work together and get it right. As we prepare for a very tough 2009, with most signs pointing to continued deterioration of the economy, we still remain long-term optimists about our future and that of our country. Whatever may come, we will meet the challenge.

In this letter, I will describe our 2008 performance by line of business and review the many critical events of the previous year. I also will focus on where the industry went wrong and what the implications for the future may be. I hope, after reading this letter, you will share my confidence in our ability to build a stronger, more vibrant company for the future.

I. REVIEW OF 2008 FINANCIAL PERFORMANCE AND BUSINESS RESULTS

JPMorgan Chase earned nearly $6 billion in 2008, down 64% from the $15 billion we earned in the prior year. During a "normal" credit cycle and environment, we should earn more than $15 billion. So clearly, this was not a great year financially. Essentially, the year's financial results were marred by two issues, both of which were highlighted as major risks in last year's letter. The first related to increasing credit costs, mostly for consumer and mortgage loans. The second resulted from Investment Bank write-downs of more than $10 billion, primarily from leveraged lending and mortgage exposures.

Throughout this financial crisis, we have benefited from a fortress balance sheet. We started this year with Tier 1 capital of 8.4% and ended it with 10.9%. We increased credit loss reserves to $24 billion (up almost $14 billion, including $4 billion related to Washington Mutual (WaMu)). Even without the infusion of government capital in the year's final quarter, our Tier 1 capital at year-end would have been 8.9%. Across all other measures of capital, we have remained relatively conservative. Although we did not anticipate all of the extraordinary events of the year, our strong balance sheet, general conservatism and constant focus on risk management served us well and enabled us to weather this terrible environment.

While we are disappointed with our 2008 financial results, we have not lost sight of our important achievements. We are extremely gratified that we were able to grow and gain healthy market share in virtually *all* of our businesses. And we never stopped investing in our systems and infrastructure and adding bankers, branches and products.

Regardless of what 2009 will bring, this emphasis on serving clients and growing our businesses will drive our results for years to come.

A. Results by Line of Business

The Investment Bank reported a loss of $1.2 billion

Our Investment Bank (IB) had disappointing financial results on an absolute basis but performed relatively well compared with most of our competitors. The results reflect a tough operating environment and suffered from the aforementioned $10 billion in write-downs on leveraged lending and mortgage-related assets, partially related to the acquisition of Bear Stearns. While those write-downs were painful, they were among the lowest in our industry. Moreover, our underlying business performed solidly, and in some notable areas, it outperformed. Several core businesses – Rates and Currencies, Commodities, Emerging Markets and Credit Trading – reported record results.

We also were able to make significant progress across our IB business. At the end of May, we closed our acquisition of Bear Stearns, which I will discuss in more detail later in this letter. Throughout the year, we stayed completely focused on servicing our corporate and investor clients, and in spite of the credit crisis, we continued to be there for our clients when they needed our advice and responsible capital support. J.P. Morgan was engaged in nearly all of the largest and most complex deals of the year, and we solidly established ourselves as the first call for clients on their most important challenges.

We try not to overemphasize market share tables or awards, but years of focus and discipline did lead to some extraordinary industry recognition that is worth noting. We earned our best rankings ever across the league tables, finishing first in global investment banking fees; mergers and acquisitions; global syndicated loans; debt; equity; and debt and equity-related transactions – the only firm ever to finish No. 1 in all of these categories in a given year. In our Markets businesses, client revenue increased 40% year-over-year, as clients shifted more of their business to us in uncertain times. In addition, J.P. Morgan received top awards from *International Financing Review*, *Risk* and *Financial News* and received a leading number of distinctions in the Greenwich Associates' 2008 Quality Leader survey – a record number of industry honors for us.

As we move into 2009, we are not resting on our laurels. We know we operate in a risky business with many tough competitors who inevitably will come back strong – even if some currently are distracted. We also know that the investment banking business, in many ways, will never be the same. Leverage will be lower, and certain structured financial products will likely cease to exist. But the fundamental business will remain the same: advising corporations and investors, raising capital, executing trades, providing research, making markets, and giving our clients the best ideas and the financing to make those plans a reality.

Retail Financial Services reported net income of $880 million with an ROE of 5%

With $880 million in earnings, Retail Financial Services (RFS) had a poor year overall. For its two primary businesses – Retail Banking and Consumer Lending – it was a tale of two cities.

On the plus side, Retail Banking, which includes Consumer Banking and Business Banking, earned $3 billion and, more important, grew its franchise – both organically and through the acquisition of Washington Mutual. We expect the WaMu acquisition to contribute more than $2 billion in annual earnings, and it has extended our branch network to more than 5,000 branches in 23 states, adding 7,200 bankers and increasing our ATMs to 14,500, the second-largest ATM network nationally. In Retail Banking, since the Bank One merger and the addition of The Bank of New York and WaMu branch networks, we have exponentially grown our footprint, adding 4,400 branches through acquisition and 500 organically. This five-year expansion is reflected in more checking accounts (from 2.3 million to 24 million), more deposits (from $89 billion to $342 billion) and more states in which we operate (from four to 23).

On the negative side, Consumer Lending, which includes the Mortgage, Home Equity, Student Loan and Auto Finance businesses, reported a loss of $2.1 billion, driven by a 274% increase, to $9.5 billion, in the provision for credit losses, primarily in the home lending businesses. Despite these losses, Consumer Lending remains core to what we do. It enables us to serve customers across many products and extend $352 billion in loans. However, continued pressure on home prices, the effects of past poor underwriting standards and the deepening recession have pushed up, and, unfortunately, will continue to push up, credit costs. Our current expectation is that quarterly charge-offs for the Mortgage and Home Equity portfolios could range from $1.8 billion to $2.4 billion (an extremely high annualized loss rate of 3.5% to 5%). By the end of 2008, we had reserves of more than $8 billion across all of RFS, and, with the expectation of higher charge-offs, we also expect to build additional reserves in 2009. However, there is one area that has shown an improving trend: third-party mortgage servicing. This business relies on scale and efficiency and, including the addition of the WaMu portfolio, it grew 91% to $1.17 trillion of loans.

We believe we have corrected for the underwriting mistakes of the past. Essentially, by the end of 2008, we saw a return to old-fashioned home lending standards (a maximum of 80% loan-to-value, with fully documented income). In addition, we closed down all business originated by mortgage brokers. My worst mistake of the past several years was not doing this sooner. In general, the credit losses in the broker-originated business are two to three times worse than that of our own directly originated business. Unfortunately, approximately 30% of our home loans were originated through the broker channel. Although we will be paying for this bad underwriting for years to come, we will continue to build the Consumer Lending business with new standards in place.

We have always loved the Retail Banking business and believe that the exceptional economics of the branch-based businesses will fuel growth and earn a return on equity (ROE) of more than 30% over time. As for the Consumer Lending business, it should produce returns of 15%-20%, especially as we capitalize on the benefits of cross-selling and cross-underwriting.

Earnings by Line of Business (in millions)

	2004[a]	2005	2006	2007	2008
Investment Bank	$ 3,654	$ 3,673	$ 3,674	$ 3,139	$ (1,175)
Retail Financial Services	3,279	3,427	3,213	2,925	880

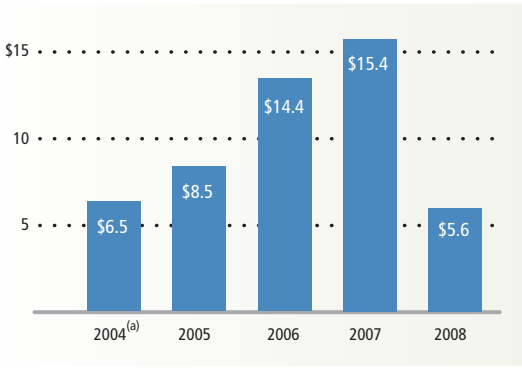
JPMorgan Chase	$ 6,544	$ 8,483	$ 14,444	$ 15,365	$ 5,605

(a) 2004 data are unaudited pro forma combined, reflecting the merger of JPMorgan Chase and Bank One

Card Services reported net income of $780 million with an ROE of 5%

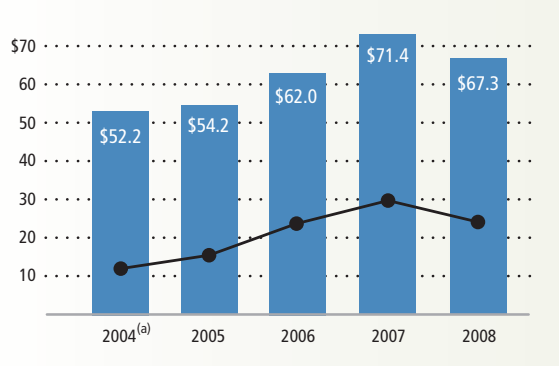
Card Services' full-year net income was $780 million, down 73% year-over-year as charge-offs increased from $5.5 billion in 2007 to $8.2 billion in 2008 (up 48%). The net charge-off rate was approximately 5% of loans. In 2008, Card Services increased net revenue by 8% and grew managed loans by 3% (excluding WaMu).

In 2008, we added 14.9 million new credit card accounts. By investing in activities to further engage current cardmembers and attract new customers, we continued growing the business. These activities included renewing contracts with important partners (AARP, Continental, Disney, Marriott and United) and enhancing our customer service. Equally important, Chase kept credit open and available to customers and businesses in a safe and sound manner and extended more than $84 billion in new credit.



With the WaMu acquisition, Chase became the largest credit card issuer in the nation, with more than 168 million cards in circulation and more than $190 billion in managed loans. Yet, being the biggest does not mean we are the best. We will continue to invest in areas that will make us the best in the business. Specifically, our focus will be on responsive customer service, valued loyalty and rewards programs, and upgraded systems and infrastructure. In addition, our ability to do a better job underwriting and to give our customers added value through cross-selling is a huge competitive advantage in both the card and retail banking businesses.

Our focus on sound risk management extends to the card business. Early in this crisis, we responded quickly to leading indicators of change and made considerable risk management improvements. This included: raising the credit-score threshold for direct-mail marketing and increasing the number of applications that are subject to our thorough review process. We regularly manage our customers' credit lines, based on their willingness and ability to pay. While we are lowering credit lines for customers who show signs of increased risk or inactivity, we also are raising lines for our most creditworthy customers. In addition, we are closing accounts that have been inactive for long periods of time because we know from experience that these accounts are extremely risky.



Looking ahead, we expect losses will continue to increase from 5% to 9%, essentially tracking the rate of unemployment. To prepare for higher losses, we increased our reserves from $3 billion to $8 billion and are intensifying our collections efforts. At the same time, we have expanded our use of flexible payment programs to help those customers experiencing financial distress: In 2008, we saw 600,000 new enrollments in payment programs, and we anticipate, and are prepared for, that number to increase.

We do not expect 2009 to be a good year for the credit card business. In fact, we do not expect to make any money in Card Services this year. However, once this crisis is over, we believe that our ongoing investments in service quality, rewards programs and enhanced infrastructure will ultimately make us one of the best credit card companies in America.

Net Income
(in billions)

Net Revenue
(in billions)

Pretax preprovision profit

(a) 2004 data are unaudited pro forma combined, reflecting the merger of JPMorgan Chase and Bank One

Commercial Banking reported net income of $1.4 billion with an ROE of 20%

Commercial Banking delivered strong results, outperforming its peer group and even exceeding our 2008 plan in a tough year. Strong credit quality, risk management, client service, operational efficiency, expense control and effective pricing all contributed to the strong result: a 27% increase to a record $1.4 billion of net income, on a record $4.8 billion in revenue. And instead of relying on lending to be the key driver of revenue, Commercial Banking achieved record results in gross investment banking revenue of $966 million (up 9%), treasury services revenue of $2.6 billion (up 13%), average liability balances of $103.1 billion (up 18%) and average loan balances of $82.3 billion (up 35%). It also is notable that only 36% of Commercial Banking's revenue relates to loans.

In addition to ranking among the top three commercial banks nationally in market penetration and lead share and being the No. 2 large middle-market lender in the United States, Commercial Banking maintained a favorable market position relative to peers in risk management and deposit growth. We also are encouraged by the prospects for the Commercial Term Lending business we acquired from WaMu and the expansion of our middle-market model across the West and Southeast footprints. As ever, client selection is critical to our success, and Commercial Banking has not only created more than 1,800 new relationships but also has expanded nearly 10,000 existing relationships – a sign of the continued vitality of our business.

That said, due to our clients' waning loan demand and higher credit losses, 2009 will be a tough year for the Commercial Banking business. While we expect problems in commercial construction and real estate to worsen for the rest of this year, we are fortunate to have limited exposure and strong reserves. The turbulence in the economy and its anticipated impact on the broader Commercial Banking portfolio have led us to shift into a recession-management mode and dedicate many of our best resources into critically important workout units, where expert senior managers are involved on a daily basis.

Commercial Banking is a business with excellent long-term value for us. We play a critical role in serving so many great companies across this nation. And as this important and vibrant sector of the economy grows, so will we.

Treasury & Securities Services reported record net income of $1.8 billion

Treasury & Securities Services (TSS) delivered exceptional financial results in 2008. Its net income has more than doubled since 2005. For 2008, it stands at $1.8 billion (up 26%), with a 47% return on equity, on record revenue (up 17%). We value this business tremendously and appreciate how it has grown consistently over time, produced good margins, and maintained great global scale and long-standing client relationships.

The business maintains a leading position in holding, valuing, clearing and servicing securities and providing cash management, corporate card and liquidity prod-

ucts, and trade finance services to the world's leading companies and institutional investors. We now serve more than 2,800 clients around the world. In 2008, TSS brought in more than 250 significant new client relationships, representing more than $80 million in annualized revenue. In a business with global scale, 50% of TSS' revenue is from business outside the United States, and in 2008, this revenue grew by 15%. TSS further strengthened its international presence, expanding services in more than 20 countries throughout Europe, the Middle East, Africa, Asia and Latin America – we now do business in more than 45 countries.

Notably, TSS also broke its single-day U.S. dollar-clearing volume record – by clearing a staggering $5 trillion in a single day, 59% over its average. Due to market conditions, TSS assets under custody decreased by 17% to $13.2 trillion. Yet, at the same time, average liability balances were up 22% to $280 billion, reflecting a flight to quality as clients were drawn to the stability of J.P. Morgan.

TSS is preparing for continued stress in the equity markets in 2009, declining securities lending balances and the negative impact of 0% interest rates. Nevertheless, it remains an excellent business, serving clients from all five of our other businesses, and we expect it to produce strong results for years to come.

Asset Management reported net income of $1.4 billion with an ROE of 24%

Asset Management, with assets under supervision of $1.5 trillion, experienced a turbulent year in 2008. As anticipated in this letter last year, earnings dropped (by 31%). But overall, the year's results were the result of three trends: continued strong growth in Private Banking, a small reduction in assets under management (but a large change in the mix of asset types) and a rigorous management of risk.

Private Banking had an exceptional year, bringing in a record number of new clients and a record level of net new assets (approximately $80 billion, for a total of $538 billion). Earnings grew 12%. Over the past two years, more than 235 new bankers have joined the Private Bank and promise to contribute significantly to its future growth.

Assets under management were $1.13 trillion at the end of 2008 versus $1.19 trillion in 2007. Net new inflows were a healthy $151 billion, up 31% from the prior year. Unfortunately, this was more than offset by the declines in market values. In addition, there was a large change in the mix of assets. The cash we manage for all our clients increased dramatically, with liquidity balances growing by $210 billion to reach $613 billion by year-end, as clients globally sought safety away from higher-risk investments. Equities and alternatives went in the opposite direction, with a 49% decline to $240 billion from $472 billion, largely due to a 41% drop in the value of equity markets. Finally, alternative assets dropped 17% to $100 billion from $121 billion.

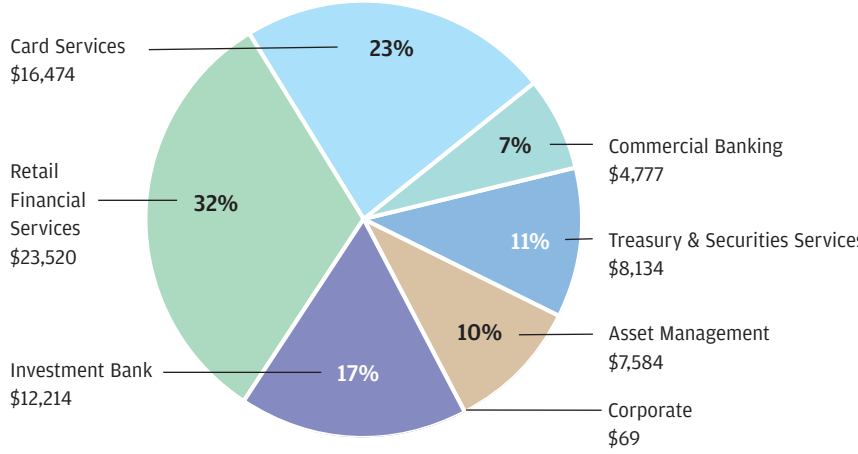
The current turmoil has reinforced the importance of managing risk. Our culture of strong risk management (proper due diligence, documentation, auditing, among other measures) is consistent with our philosophy of putting clients' interests first and has enabled us to avoid many of the negative developments that surfaced last year.

We anticipate another difficult year in 2009, with earnings continuing to be affected by market conditions. But this is a great business, and we intend to keep it that way by focusing on helping our clients through the current environment.

The Corporate sector reported net income of $557 million

In 2008, we reported a net loss of $700 million in Private Equity – a different story from 2007, when we reported pre-tax private equity gains of more than $4 billion. We love the private equity business, but as we indicated in prior years, private equity returns are by their nature lumpy, and we did not expect the stellar 2007 results to be repeated in 2008. We will remain patient and still expect this business to deliver in excess of 20% return on equity for us over time.

Aside from Private Equity, our Corporate sector, excluding merger-related items, produced $1.5 billion in net income. This includes unallocated corporate expense of approximately $500 million, which we expect to continue at approximately the same level in 2009, as well as a myriad of other items that are disclosed in detail in our financial statements.



B. Strong strategic positions of all our businesses

One important and critical point to highlight is that each of our businesses now ranks as one of the top three players in its respective industry. As ever, our goal is to be the best, not necessarily the biggest. That said, we know that size matters in businesses where economies of scale – in areas such as systems, operations, innovation, branding and risk diversification – can be critical to success. The only reason to get bigger and gain economies of scale is when doing so enables you to do a better job for your clients; i.e., by giving them more, better and faster at a lower cost. Ultimately, this is also the only real reason to do a merger – the client gets something better. If this isn't the case, big can be bad. If bureaucracy, hubris, lack of attention to detail – or other ailments of large corporations – overwhelm the benefits of size, then failure will ultimately result.

We are also keenly aware of the value added at more detailed levels in our businesses. For example, in Retail Financial Services, we gained share with small businesses as we expanded our brand footprint. Our Investment Bank has become a top player in both Prime Brokerage and Energy, previously two of our weak spots. Commercial Banking added WaMu's Commercial and Community Lending businesses to its portfolio, representing $44.5 billion in loans. And Private Banking's record in net new asset flows showed the strength of the J.P. Morgan franchise, as high-net-worth individuals worldwide chose us to manage their investments. We also continue to upgrade our infrastructure by improving systems, data centers, products and services.

Suffice it to say, we like our market position and believe that each business is strong and getting stronger. Even in tough years like 2008 and 2009, we did not – and will not – stop doing all the things that make our businesses better.

II. REVIEW OF CRITICAL EVENTS OF THE YEAR

In this section, I want to review some of the critical events for us this past year:

- The purchase of Bear Stearns
- The purchase of Washington Mutual
- The gathering storm that arrived with a vengeance
- The acceptance of government TARP

A. The purchase of Bear Stearns

On May 30, 2008, we closed our acquisition of Bear Stearns – a deal completed in record time under truly extraordinary circumstances.

Over the weekend of March 15, we were asked by the U.S. government to assist in preventing Bear Stearns from going bankrupt before the opening of the Asian markets on Monday morning. The possibility was real that if Bear Stearns had been allowed to go bankrupt, it could have had a cataclysmic effect on the financial markets. (Many believe that later experiences with Lehman Brothers essentially proved this to be true.) To a person, our Board of Directors felt JPMorgan Chase had a special obligation to do all we could to help, especially knowing that we were among the few companies – if not the only one – in a position to do so. However, this deal posed more risks and threatened to be more backbreaking than any other acquisition we had done in the past. And it had to make sense for our shareholders.

Going into this deal, we had two things in our favor: the strength of our balance sheet and capital base and the skill of our people.

Our first priority was to quickly reduce our downside risk. This required us to massively de-risk Bear Stearns quickly and in potentially dangerous markets. Bear Stearns had approximately $400 billion in assets that we needed to consolidate into our financial and risk systems and reduce quickly to approximately $200 billion of assets. We had to manage this reduction so that the remaining risk was manageable and well-controlled. The potential downside – given the treacherous markets – was enormous. We asked the government to finance and assume the risk on approximately $30 billion of mortgage assets (compared with our $370 billion of total assets acquired from Bear Stearns). The portion that the government agreed to take comprised the less risky mortgage assets (we kept the most risky mortgage assets). We simply could not and would not take on any more mortgage risk – it would have been extremely irresponsible. And remember, the government could finance the assets much more cheaply than we could and could hold them as it saw fit, whereas we would have been forced to sell them immediately.

Under normal conditions, the price we ultimately paid for Bear Stearns would have been considered low by most standards. But these were not normal conditions, and because of the risk we were taking, we needed a huge margin for error. We were not buying a house – we were buying a house on fire.

We paid $1.5 billion for Bear Stearns, a company that had reported a little more than $11 billion in common equity. We knew that most – but we hoped not all – of the common equity we were buying would be used for close-down costs, litigation expenses, severance costs and, most important, quickly eliminating the risk on the balance sheet. We have largely completed this task, but, unfortunately, all of the equity was used up in this process, and several billions more in losses ran through our income statement in the second half of 2008.

Despite these additional costs, we still believe that Bear Stearns has added significantly to our franchise. In particular, it completed our franchise in two areas where we were weak, Prime Brokerage and Commodities, and it enhanced our broader equity and fixed income businesses. Ultimately, we expect the businesses we acquired to add approximately $1 billion of annual earnings to the company.

The truly impressive part of the Bear Stearns deal was the human side – seeing our people rise to the challenge under a great deal of strain. On Thursday night, March 13, I called our investment banking heads, Steve Black and Bill Winters, who then called our finance, audit, tax, trading and banking professionals as well as legal, real estate and systems teams around the world – many of whom got out of bed and went back to work.

Soon, hundreds returned to work that night. By the weekend, thousands of people from around the world were working around the clock. These professionals ably managed the due diligence work and gave us the confidence we needed to complete the deal. Their Herculean effort over that weekend and the next several months made it possible for us to sign and close the deal in about 75 days. If you could have seen what I saw during that intensely stressful time, you would have been very proud of the team at JPMorgan Chase.

B. The purchase of WaMu

On September 25, the Federal Deposit Insurance Corporation (FDIC) seized the banking assets of Washington Mutual in the largest bank failure in history. Moments later, we acquired the deposits, assets and certain liabilities of Washington Mutual for approximately $1.9 billion. We now know that JPMorgan Chase was the only bank prepared to act immediately. We acquired WaMu's 2,200 branches, 5,000 ATMs and 12.6 million checking accounts, as well as savings, mortgage and credit card accounts. Importantly, we did not acquire the assets or liabilities of the bank's holding company or assume the $14 billion of senior unsecured debt and subordinated debt of Washington Mutual's banks.

The deal was financially compelling – it was immediately accretive to earnings, and it will add an estimated $2 billion or 50 cents per share to our 2009 results and increasingly more thereafter. To achieve these anticipated earnings, we did not rely on heroic revenue assumptions. Instead, we mostly relied on expected cost savings (net of the large investments in the technology and refurbishment of the branches) of $1.5 billion. We now expect to achieve cost savings of more than $2 billion. We also plan to complete all rebranding and system conversions by the end of this year.

With the acquisition of WaMu, we purchased approximately $240 billion of mortgage and mortgage-related assets, with $160 billion in deposits and $38 billion in equity. We immediately wrote down most of the bad or impaired assets (approximately $31 billion), properly reserved for the remaining assets, and established reserves for severance and close-down costs. After recognizing all of these costs, we believe that we now have a relatively "clean" company that came with approximately $4 billion in "good" common equity.

Our due diligence on WaMu's assets was extensive, and our assumptions were conservative. We assumed that home prices would go down another 10% (from the day we closed), providing a healthy margin for error. However, if home prices go down more than expected, say 20%, all other things being equal, this could cost us $5 billion-$10 billion more. Even under these circumstances, we think the transaction will remain a great deal, at a great price for our shareholders. We are confident that it will add enormous value to JPMorgan Chase in the future.

Given our conservative nature, we sold $11.5 billion in common stock the morning after the deal announcement to maintain our strong capital base. The capital raise – upsized due to strong response from investors – was the largest U.S. common stock follow-on offering ever executed. In addition, WaMu's retail deposits contributed to our stable funding base and liquidity position.

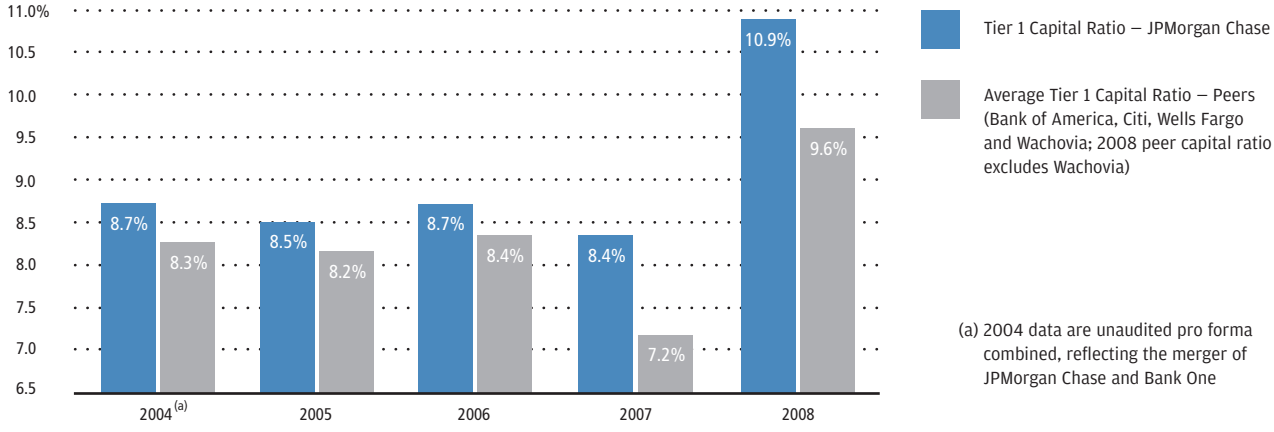
In prior years, we consistently expressed our desire to broaden our retail footprint to attractive regions such as the West Coast and Florida – as long as the plan made good sense financially and we could execute the transaction effectively. The WaMu transaction aligned perfectly with this criteria. Specifically, it expands our retail franchise into fast-growing new markets with established branches; bolsters our presence in our significant footprint states; and, over time, will allow us to extend the reach of our commercial banking, business banking, credit card and wealth management efforts. These additional businesses were not heritage strengths of WaMu but, in effect, can be built on top of the WaMu branches and we hope eventually will add another $500 million to our earnings (this will take many years and was not built into our original assumptions). An expanded product line, together with enhanced systems, will benefit former WaMu customers tremendously.

Our people across the business – together with our experts in systems, marketing, legal, finance, audit and human resources – did an outstanding job executing this transaction, making it possible for us to take this important strategic step.

C. The gathering storm arrived with a vengeance – and how JPMorgan Chase fared

In 2008, Bear Stearns collapsed; Lehman Brothers declared bankruptcy; Fannie Mae and Freddie Mac were placed into government conservatorship; the government assumed majority ownership of AIG; Merrill Lynch sold itself to Bank of America; Wells Fargo took over a struggling Wachovia; IndyMac and WaMu went into receivership by the Federal Deposit Insurance Corporation; Countrywide and the U.S. mortgage business virtually collapsed; the two remaining major investment banks, Goldman Sachs and Morgan Stanley, became bank holding companies; around the globe, French, British, Swiss and German banks were rescued by their governments; and the world entered the sharpest, most globalized downturn since the Great Depression.

As for JPMorgan Chase, we had large credit and operational exposures in virtually every situation mentioned above, affecting nearly every line of business. Our firm's management teams, credit officers, risk officers, and legal, finance, audit and compliance teams worked tirelessly to protect the company. We believe it is a considerable sign of strength that we could manage through such extraordinary problems with minimal losses to the company.



We avoided many critical problems that would have made things far worse

In last year's letter, we focused on our problems – including mortgage issues in Retail Financial Services and write-downs in the Investment Bank of leveraged loans and mortgage securities. Those issues cost us a considerable amount of money in 2008 and will continue to cost us money in 2009. But it also is instructive to focus on how we were able to avoid certain problems, control the damage and minimize the cost.

In 2008:

- We essentially stayed away from sponsoring structured investment vehicles (SIV) because we viewed them as arbitrage vehicles with plenty of risk and a limited business purpose. We also minimized our financing to SIVs for the same reasons, and back in 2005, we sold the only small SIV we had sponsored.
- We didn't write option ARMs (adjustable rate mortgages) because we did not think they were a consumer-friendly product. Although we made plenty of mistakes in the mortgage business, this was not one of them.
- We substantially cut back on subprime early in the crisis. While subprime mortgages cost us nearly $1 billion in 2008, we avoided far worse results because we had significantly reduced our exposures in 2006. This was true both in the mortgage business and in the Investment Bank.
- We never built up the structured finance business. While we are a large player in the asset-backed securities market, we deliberately avoided the structured collateralized debt obligation (CDO) business because we believed the associated risks were too high. Structured finance in its most complicated forms, such as "CDO-squared," has largely disappeared after unleashing a myriad of problems on the financial system. They will not be missed.
- We did not unduly leverage our capital, nor did we rely on low-quality forms of capital. We always had high targets of 8% to 8.5% Tier 1 capital. We always believed in "high-quality" capital, which, among other things, means conservative accounting, strong loan loss reserves and a high component of tangible common equity. The higher the quality of capital, the more prepared one is for tough times.
- We maintained a high level of liquidity – and were always prepared for unexpected draws (i.e., collateral calls). Strong liquidity is a constant for us. The fact that we have total deposits of $1 trillion across our retail and wholesale businesses positions the firm advantageously overall and has helped us weather

Peer Comparison of Tier 1 Capital Ratios

(a) 2004 data are unaudited pro forma combined, reflecting the merger of JPMorgan Chase and Bank One

the worst of the crisis. We will do whatever it takes to ensure that our liquidity remains a strong part of our fortress balance sheet so that we can maintain flexibility during challenging times to be in a position to support our clients.

- We avoided short-term funding of illiquid assets, and we essentially do not rely on wholesale funding. (Of our $1 trillion of deposits, approximately $300 billion is referred to as "wholesale," but it essentially is comprised of deposits that corporate clients leave with us in the normal course of business – i.e., they are "sticky" and not like brokered certificates of deposit or "hot money" that move on a whim for one basis point.) Simply put, we still follow the financial commandment: Do not borrow short to invest long.

D. The acceptance of government TARP

On October 13, 2008, I went to Washington, D.C., with eight chief executives of other financial firms. There, we were asked by the Secretary of the Treasury, the Chairman of the Federal Reserve, the Office of the Comptroller of the Currency (OCC), the FDIC and the New York Federal Reserve Bank to agree to accept a package of capital from the government. As part of its Troubled Asset Relief Program (TARP), the U.S. government was proposing some powerful measures to help fix the collapse in the credit and lending markets. They prevailed upon the nine of us to set an example for others by accepting this capital infusion as a sign of our unanimous support of these measures. The logic was that a massive infusion of capital into the U.S. banking system would pave the way for the industry as a whole to extend more credit than they otherwise would have provided. The government's view was also that if any of the banks declined the TARP funds, then many of the additional banks might not want to be tainted by their acceptance of the TARP money because it might be viewed as a sign of weakness.

We felt then that accepting the TARP funds was the right thing to do for the U.S. financial system – even though it may not have been as beneficial for JPMorgan Chase as it was for some of the others

In short, we did not ask for the TARP capital infusion, and we did not feel we needed it (our Tier 1 capital at year-end would have been 8.9% without it). In fact, the TARP program had asymmetric benefits to those accepting it; i.e., it was least beneficial to strong companies like ours and vice versa. That said, we believe that accepting the TARP funds was the right thing to do for the U.S. financial system – and that JPMorgan Chase should not be parochial or selfish and stand in the way of actions that the government wanted to take to help the whole financial system.

We think the government acted boldly in a very tough situation, the outcome of which could have possibly been far worse had it not taken such steps

The government acted quickly and boldly – taking unorthodox steps to try to right the ship. It had to act with urgency while dealing with complex and rapidly changing problems that did not lend themselves to simplistic solutions. While we will never actually know, we believe, as many economists and analysts do, that without these and other actions the government has taken to date, things could have been much worse.

So while it is easy to criticize the timing, marketing or consistency of the effort – we also recognize how hard it is to act boldly in difficult and dangerous times. We should remind ourselves of what President Theodore Roosevelt expressed nearly a century ago:

"*It is not the critic who counts; not the man who points out how the strong man stumbles, or where the doer of deeds could have done them better. The credit belongs to the man who is actually in the arena, whose face is marred by dust and sweat and blood; who strives valiantly; who errs, who comes short again and again, because there is no effort without error and shortcoming; but who does actually strive to do the deeds; who knows great enthusiasms, the great devotions; who spends himself in a worthy cause; who at the best knows in the end the triumph of high achievement, and who at the worst, if he fails, at least fails while daring greatly, so that his place shall never be with those cold and timid souls who neither know victory nor defeat.*"

We hope that our leaders will continue to be bold and brave in seeking solutions to these once-in-a-generation problems.

Banks are lending, and the TARP is probably helping

It is important to recognize that TARP capital is only 14% of our total capital. It is also important to recognize that to the extent we use the money and lose it, the risk is 100% ours because we still owe the money back to the government. Despite that, we, and other banks, are trying to use TARP capital to benefit shareholders, clients and communities. In the fourth quarter of 2008 alone, we extended more than $150 billion in new credit to consumers, businesses, municipalities and not-for-profit organizations, including nearly $30 billion in home lending and $2.8 billion in auto lending. We increased loans and commitments to government units, health care companies and not-for-profits by 33% in 2008 and plan to increase lending to these groups by $5 billion in 2009. We also completed several major syndicated leveraged finance loans, and, in one critical instance, we bought the entire $1.4 billion bond issue from the state of Illinois when no one else would bid for it, giving Illinois the financing for payroll and other important needs. Finally, we remain very active in the interbank market (where banks lend to each other) and have had on average $40 billion to $50 billion out in the interbank market each night.

While total lending by banks fluctuates according to the markets and changing credit conditions, we do believe that TARP has enabled many banks to increase their lending in certain key areas – more than they otherwise would have done.

While we clearly understood that there might be potential (mostly political) unintended consequences of TARP, we believed that it would help the U.S. financial system at that critical moment.

III. FUNDAMENTAL CAUSES AND CONTRIBUTIONS TO THE FINANCIAL CRISIS

After Lehman's collapse, the global financial system went into cardiac arrest. There is much debate over whether Lehman's crash caused it – but looking back, I believe the cumulative trauma of all the aforementioned events and some large flaws in the financial system are what caused the meltdown. If it hadn't been Lehman, something else would have been the straw that broke the camel's back.

The causes of the financial crisis will be written about, analyzed and subject to historical revisions for decades. Any view that I express at this moment will likely be proved incomplete or possibly incorrect over time. However, I still feel compelled to attempt to do so because regulation will be written soon, in the next year or so, that will have an enormous impact on our country and our company. If we are to deal properly with this crisis moving forward, we must be brutally honest and have a full understanding of what caused it in the first place. The strength of the United States lies not in its ability to avoid problems but in our ability to face problems, to reform and to change. So it is in that spirit that I share my views.

Albert Einstein once said, "Make everything as simple as possible, but not simpler." Simplistic answers or blanket accusations will lead us astray. Any plan for the future must be based on a clear and comprehensive understanding of the key underlying causes of – and multiple contributors to – the crisis, which include the following:

- The burst of a major housing bubble
- Excessive leverage pervaded the system
- The dramatic growth of structural risks and the unanticipated damage they caused
- Regulatory lapses and mistakes
- The pro-cyclical nature of virtually all policies, actions and events
- The impact of huge trade and financing imbalances on interest rates, consumption and speculation

Each main cause had multiple contributing factors. As I wrote about these causes, it became clear to me that each main cause and the related contributors could easily be rearranged and still be fairly accurate.

It was also surprising to realize that many of the main causes, in fact, were known and discussed abundantly before the crisis. However, no one predicted that all of these issues would come together in the way that they did and create the largest financial and economic crisis of our lifetime.

Even the more conservative of us, and I consider myself to be among them, looked at the past major crises (the 1974, 1982 and 1990 recessions; the 1987 and 2001 market crashes) or some mix of them as the worst-case events for which we needed to be prepared. We even knew that the next one would be different – but we missed the ferocity and magnitude that was lurking beneath. It also is possible that had this crisis played out differently, the massive and multiple vicious cycles of asset price reductions, a declining economy and a housing price collapse all might have played out differently – either more benignly or more violently.

It is critical to understand that the capital markets today are *fundamentally* different than they were after World War II. This is not your grandfather's economy. The role of banks in the capital markets has changed considerably. And this change is not well-understood – in fact, it is fraught with misconceptions. Traditional banks now provide only 20% of total lending in the economy (approximately $14 trillion of the total credit provided by all financial intermediaries). Right after World War II, that number was almost 60%. The other lending has been provided by what many call the "shadow banking" system. "Shadow" implies nefarious and in the dark, but only part of this shadow banking system was in the dark (i.e., SIVs and conduits) – the rest was right in front of us. Money market funds, which had grown to $4 trillion of assets, directly lend to corporations by buying commercial paper (they owned $700 billion of commercial paper). Bond funds, which had grown to approximately $2 trillion, also were direct buyers of corporate credit and securitizations. Securitizations, which came in many forms (including CDOs, collateralized loan obligations and

commercial mortgage-backed securities), either directly or indirectly bought consumer and commercial loans. Asset securitizations simply were a conduit by which investment and commercial banks passed the loans onto the ultimate buyers.

In the two weeks after the Lehman bankruptcy, money market and bond funds *withdrew approximately $700 billion from the credit markets*. They did this because investors (i.e., individuals and institutions) withdrew money from these funds. At the same time, bank lending actually went up as corporations needed to increasingly rely on their banks for lending. With this as a backdrop, let's revisit the main causes of this crisis in more detail.

A. The burst of a major housing bubble

U.S. home prices have been appreciating for almost 10 years – essentially doubling over that time. While some appreciation is normal, the large appreciation, in this case, and the ultimate damage it caused were compounded by the factors discussed below.

New and poorly underwritten mortgage products (i.e., option ARMs, subprime mortgages) helped fuel asset appreciation, excessive speculation and far higher credit losses

As the housing bubble grew, increasingly aggressive underwriting standards helped drive housing price appreciation and market speculation to unprecedented levels. Poor underwriting standards (including little or no verification of income and loan-to-value ratios as high as 100%) and poorly designed new products (like option ARMs) contributed directly to the bubble and its disastrous aftermath.

Mortgage securitization had two major flaws

In many securitizations, no one along the chain, from originator to distributor, had ultimate responsibility for the *results* of the underwriting. In addition, the poorly constructed tranches of securitizations that comprised these transactions effectively converted a large portion of poorly underwritten loans into Triple A-rated securities. Clearly, the rating agencies also played a key role in this flawed process. These securitizations ended up in many forms; the one most discussed is CDOs. Essentially, these just added a lot more fuel to the fire.

While most people are honorable, excess speculation and dishonesty were far greater than ever seen before, on the part of both brokers and consumers

The combination of no-money-down mortgages, speculation on home prices, and some dishonest brokers and consumers who out-and-out lied will cause damage for years to come. This, in no way, absolves the poor underwriting judgments made by us and other institutions, and it certainly doesn't absolve anyone who mis-sold loans to consumers.

B. Excessive leverage pervaded the system

Over many years, consumers were adding to their leverage (mostly as a function of the housing bubble), some commercial banks increased theirs, most of the U.S. investment banks dramatically increased theirs and many foreign banks had the most leverage of all. In addition, increasing leverage appeared in:

- Hedge funds, many using high leverage, grew dramatically over time. Some of that leverage was the result of global banks and investment banks lending them too much money.
- Private equity firms were increasingly leveraging up their buyouts. Again, some banks and the capital markets lent them too much money.
- Some banks (and other entities) added to their leverage by using off-balance sheet arbitrage vehicles, like SIVs and leveraged puts.
- Nonbank entities, including mortgage banks, CDO managers, consumer and commercial finance companies, and even some bond funds, all increased their leverage over time.
- Even pension plans and universities added to their leverage, often in effect, by making large "forward-commitments."

Basically, the whole world was at the party, high on leverage – and enjoying it while it lasted.

C. The dramatic growth of structural risks and the unanticipated damage they caused

I believe there are four structural risks or imbalances that grew and coalesced to cause a "run on the bank." But this was not a traditional bank run – it was a run on our capital markets, the likes of which we had never experienced. After Lehman's bankruptcy, many parts of our capital markets system stopped providing any capital to the market at all. If the crisis had unfolded differently, then perhaps the events that followed would not have occurred. Surely no one deliberately built a system with these fundamental flaws and imbalances. Clearer heads will understand that much of this was not malfeasance – our world had changed a lot and in ways that we didn't understand the full potential risk. But when the panic started, it was too much for the system to bear.

Many structures increasingly allowed short-term financing to support illiquid assets

In essence, too much longer-term, non-investment grade product was converted into shorter-term Triple A-rated product. Some banks, hedge funds, SIVs and CDOs were using short-term financing to support illiquid, long-term assets. When the markets froze, these entities were unable to get short-term financing. As a result, they were forced to sell these illiquid assets. One of the functions of banking and the capital markets is to intermediate between the needs of investors and issuers. This triggers a normal conversion, either directly or indirectly (through securitizations) of longer-term, illiquid assets held by the issuers, who need to finance the business into the shorter-term, higher-grade product that most investors want. Clearly, over time, this imbalance had grown too large and unsupportable.

Money market funds had a small structural risk, which became a critical point of failure

Money market funds promise to pay back 100% to the investor *on demand*. Many money market funds invested in 30- to-180-day commercial paper or asset-backed securities that under *typical* circumstances could be sold back at par. In normal times, investors demanded their money in fairly predictable ways, and funds were able to meet their demands. Over time, money market funds grew dramatically to exceed $4 trillion. After Lehman collapsed, one money fund in particular, which held a lot of Lehman paper, was unable to meet the withdrawal demands. As word of that situation spread, investors in many funds responded by demanding their money. In a two-week period, investors pulled $500 billion from many money funds, which were forced to sell assets aggressively. To raise liquidity, these money funds essentially were forced to sell assets. As investors moved away from credit funds and into government funds, the banks simply were unable to make up the difference. This became one more huge rupture in the dike.

Repo financing terms got too loose, and too many illiquid assets were repo'ed

Over time, in those markets where financial companies financed their liquid assets, financial terms had become too lax. For example, to buy non-agency mortgage securities, financial institutions only had to put up 2%-5% versus a more traditional 15%-25%. The repo markets also had begun to finance fairly esoteric securities, and when things got scary, they simply stopped doing so. In the two weeks after Lehman's bankruptcy, more than $200 billion was removed from this type of financing, by both investors and banks. Once again, financial institutions had to liquidate securities to pay back short-term borrowing – thus, another rupture in the dike.

Investors acted wisely to protect themselves, but the system couldn't handle them all doing it at the same time

Individual investors, corporations, pension plans, bond and loan funds, money market funds and others – all acted in their own self-interest, and all individually acted wisely. But collectively, they caused enormous flows out of the banking and credit system. Regardless of whether the funds came out of a bank, a money fund, or a bond or loan fund, the fact remains that the cumulative result was a severe shortage of necessary credit that was removed from the system.

Clearly, things had changed. In the past, regulators had focused on preventing a systemic collapse of the main intermediaries in the financial system; i.e., the banks. In this new world, however, we need to discuss how to protect ourselves not only from runs on banks but also from runs on other critical vehicles in the capital and financial markets.

D. Regulatory lapses and mistakes

With great hesitation, I would like to point out that mistakes also were made by the regulatory system. That said, I do not blame the regulators for what happened. In each and every circumstance, the responsibility for a company's actions rests with us, the CEO and the company's management. Just because regulators let you do something, it does not mean you should do it. But regulators have a responsibility, too. And if we are ever to get this right, it is important to examine what the regulators could have done better. In many instances, good regulation could have prevented some of the problems. And had some of these problems not happened, perhaps things would not have gotten this bad.

Unregulated or lightly regulated parts of the market contributed to the crisis

I've already discussed some of the flaws with money market funds and hedge funds – the latter were not regulated, and the former were lightly regulated. In addition, there are two large segments, among others, that – had they been regulated – could have helped the system avoid some problems.

- Much of the mortgage business was largely unregulated. While the banks in this business were regulated, most mortgage brokers essentially were not. In fact, no major commercial bank that was regulated by the OCC wrote option ARMs (possibly the worst mortgage product). A very good argument could be made that the lower standards of the unregulated parts of the business put a lot of pressure on those players in the regulated part of the business to reduce their standards so they could compete. In this case, bad regulation trumped good regulation.
- Insurance regulators essentially missed the large and growing one-sided credit insurance and credit derivative bets being made by AIG and the monoline insurers. This allowed these companies to take huge one-sided bets, in some cases, by insuring various complex mortgage securities.

Basel II, which was adopted by global banks and U.S. investment banks, allowed too much leverage

It is quite clear now that the second of the Accords by the Basel Committee on Banking Supervision (known as Basel II), published in 2004, was highly flawed. It was applied differently in different jurisdictions, allowed too much leverage, had an over-reliance on published credit ratings and failed to account for how a company was being funded (i.e., it allowed too much short-term wholesale funding). In 2004, the five independent U.S. investment banks adopted Basel II under the jurisdiction of the Securities and Exchange Commission (this was not allowed by the banks regulated by the Federal Reserve or the OCC, which remained under Basel I). The investment banks jettisoned prior conservative net capital requirements and greatly increased their leverage under Basel II. And the rest is history.

Perhaps the largest regulatory failure of all time was the inadequate regulation of Fannie Mae and Freddie Mac

The extraordinary growth and high leverage of Fannie Mae and Freddie Mac were well-known. Many talked about these issues, including their use of derivatives. Surprisingly, they had their own regulator, which clearly was not up to the task. These government-sponsored entities had grown to become larger than the Federal Reserve. Both had dramatically increased their leverage over the last 20 years. And, amazingly, a situation was allowed to exist where the very fundamental premise of their credit was implicit, not explicit. This should never happen again. Their collapse caused damage to the mortgage markets and the financial system. And, had the Treasury not stepped in, it would have caused damage to the credit of the United States itself.

Too many regulators – with overlapping responsibilities and inadequate authorities – were ill-equipped to handle the crisis

Our current regulatory system is poorly organized and archaic. Overlapping responsibilities have led to a diffusion of responsibility and an unproductive competition among regulators, which probably accelerated a race to the bottom. Many regulators also did not have the appropriate statutory authority (through no fault of their own) to deal with some of the problems they were about to face. One large, glaring example revealed by the collapse of Bear Stearns and Lehman was the lack of a resolution process in place to deal with failure of investment banks. If commercial banks fail, the FDIC can take them over. This was not the case with investment banks. In addition, a resolution process needs to be in place for large, global financial companies that operate in many jurisdictions and use many different regulatory licenses.

E. The pro-cyclical nature of virtually all policies, actions and events

In a crisis, pro-cyclical policies make things worse. I cannot think of one single policy that acted as a counterbalance to all of the pro-cyclical forces. Although regulation can go only so far in minimizing the impact of pro-cyclical forces in times of crisis, we still must be aware of the impact they have. For example:

- Loan loss reserving causes reserves to be at their lowest level right when things take a turn for the worse. Therefore, as a crisis unfolds, a bank not only faces higher charge-offs but also has to add to its level of reserves, depleting precious capital.
- Although we are proponents of fair value accounting in trading books (a lot of the mark-to-market losses that people complained about will end up being real losses), we also recognize that market levels resulting from large levels of forced liquidations may not reflect underlying values. Certain applications of fair value accounting can contribute to a downward spiral where losses deplete capital, and lower capital causes people to respond by selling more, at increasingly lower values.
- The rating agencies made mistakes (like the rest of us) that clearly helped fuel a CDO and mortgage debacle. They also, in the midst of a crisis, continually downgraded credits. Lower ratings, in turn, required many financial institutions to raise more capital, thus adding to the vicious cycle.
- In bad times, the market itself demands both an increase in capital and more conservative lending. We may not be able to change this phenomenon, but there are steps we can take to ensure that the system is better prepared for it.
- Financing arrangements allow the most leverage in good times, but they force a dramatic reduction in leverage in bad times.
- As capital markets volatility increases, Basel II capital calculations and many risk management tools, like Value-at-Risk, demand that more capital be held to own securities or loans.

F. The impact of huge trade and financing imbalances on interest rates, consumption and speculation

I suspect when analysts and economists study the fundamental causes of this crisis, they will point to the enormous U.S. trade deficit as one of the main underlying culprits. Over an eight-year period, the United States ran a trade deficit of $3 trillion. This means that Americans bought $3 trillion more than they sold overseas. Dollars were used to pay for the goods. Foreign countries took these dollars and purchased, for the most part, U.S. Treasuries and mortgage-backed securi-

ties. It also is likely that this process kept U.S. interest rates very low, even beyond Federal Reserve policy, for an extended period of time. It is likely that this excess demand also kept risk premiums (i.e., credit spreads) at an all-time low for an extended period of time. Low interest rates and risk premiums probably fueled excessive leverage and speculation. Excess consumption could be financed cheaply. And adding fuel to the fire, in the summer of 2008, the United States had its third energy crisis – further imbalancing capital flows.

There have been times when large imbalances – such as those in trade – sort themselves out without causing massive global disruption. However, it is bad planning and wishful thinking to assume that this will always be the case. These imbalances shouldn't be allowed to get that large – they create too much potential risk.

Many other factors may have added to this storm – an expensive war in Iraq, short-selling, high energy prices, and irrational pressure on corporations, money managers and hedge funds to show increasingly better returns. It also is clear that excessive, poorly designed and short-term oriented compensation practices added to the problem by rewarding a lot of bad behavior.

The modern financial world has had its first major financial crisis. So far, many major actors are gone: many of the mortgage brokers, numerous hedge funds, Wachovia, WaMu, Bear Stearns, Lehman and many others. Some of the survivors are struggling, particularly as we face a truly global, massive recession – and it still is not over.

The extent of the damage and the magnitude of the systemic problems make it clear that our rules and regulations must be completely overhauled. Such changes to the regulatory system *could* have huge implications on the long-term health, and strategies, of our business.

While unprecedented actions have been taken by both the Federal Reserve and the Treasury, my hope is that new policies are grounded in a thorough analysis of what happened and what we need to do about it. Political agendas or simplistic views will not serve us well.

Often we hear the debate around the need for more or less regulation. What we need is better and more forward-looking regulation. Someone has famously said that a crisis should not go to waste. But what is also true is that it shouldn't take a crisis to solve our problems. During a crisis, people panic. This can make it harder, not easier, to do the right thing. From our perspective, certain improvements would make a big difference. We would like to share with you some of our suggestions.

A. The need for a systemic regulator with much broader authority

We agree with our leaders in government that we should move ahead quickly to establish a systemic regulator. In the short term, this would allow us to focus attention on correcting some underlying weaknesses in our system and filling the gaps in regulation that contributed to the current situation. It also is clear that U.S. policy must be coordinated with the proper set of international regulators. When the crisis emerged, the actions of individual countries had a critical impact on numerous other countries. International coordination is essential in resolving this kind of crisis.

There should be procedures in place to deal with systemically important institutions – failure is fine as long as it's orderly and controlled and ***doesn't cause systemic failure***

Size is not the issue; rather, it is when institutions are too interconnected that an uncontrolled failure has the potential to bring the whole system down. What we need is a resolution process that *allows failure without causing damage to the whole system.* In the case of Bear

Stearns or Lehman – both investment banks – regulators did not have this protocol. They do have it, however, for commercial banks. Even more important, regulators are going to need a resolution process for large, global corporations that operate in many jurisdictions around the world.

The first goal should be to regulate financial institutions so they don't fail. If they do fail, a proper resolution process would ensure that action is swift, appropriate and consistent. The lack of consistency alone caused great confusion in the marketplace. For example, when some of the recent failures took place, there was inconsistent treatment among capital-holders (preferred stock and debt holders were treated very differently in different circumstances). It would have been better if the regulators had a resolution process that defined, *a priori*, what forms of aid companies would get and what the impact would be on capital-holders. The FDIC resolution process for banks provides a very good example of how a well-functioning process works.

Various liquidity and "lender of last resort" facilities, like some of those put into place during this crisis, also could be in place on an *a priori* basis. These controls would reduce risk and maximize confidence.

Regulation needs to be administered by product and economic substance, not by legal entity

We have experienced the unintended consequences of redundant regulation; i.e., different agencies regulating the same product in the mortgage business, in the derivatives business and in lending overall. If, on the other hand, similar products were overseen by a single regulator, that regulator would have much deeper knowledge of the products and full information that extends across institutions. The "regulatory competition" that could have caused a race to the bottom would be eliminated.

Hedge funds, private equity funds and off-balance sheet vehicles must be included in our regulatory apparatus without compromising their freedoms and positive attributes

Certain vehicles like hedge funds and private equity funds need to be regulated but only to protect the system against risk. These vehicles do not need to be heavily regulated like a deposit-gathering bank. We should consider requiring hedge funds over a certain size (say, $1 billion of equity) to register, provide quarterly audited reports, disclose total leverage and certain risk attributes – like volatility and investment categories – and outline operational procedures. They also could be required to show their regulators (not their competitors) any concentrated "trades" that could cause excessive systemic risk. This all could be done without compromising flexibility or disclosing confidential positions while allowing these vehicles to move capital – as freely and aggressively – as they see fit.

The systemic regulator needs the ability to anticipate risk and do something about it if necessary

There, undoubtedly, are financial products in the market today that – if unchecked – could have a destabilizing effect. A systemic regulator, had it been closely watching the mortgage industry, might have identified the unregulated mortgage business as a critical point of failure. This regulator also might have been able to limit the leverage of Fannie and Freddie once they were deemed to pose major systemic risks. Such a regulator might have been in the position to recognize the one-sided credit derivative exposures of AIG and the monoline insurers and do something about it.

A systemic regulator also should be on the lookout for new or potential structural risks in our capital markets, such as the structural flaw that grew in money market funds.

B. The need to simplify our regulatory system

Everyone agrees that the existing system is fragmented and overly complex. We have too many regulators and too many regulatory gaps. No one agency has access to all the relevant information. Responsibility often is highly diffused. This problem could be relatively easy to fix but only if we have the political will to fix it.

C. The need to regulate the mortgage business — including commercial mortgages — in its entirety

Many of the same gaps in regulation that helped lead us into this mess still exist today – for example, in the

mortgage business. Mortgages are the largest financial product in the United States, and while we do not want to squelch innovation, the entire mortgage business clearly needs to be regulated. This is not the first time that mortgages and real estate have led this country and many of its financial institutions into deep trouble. Proper regulation would go a long way toward standardizing products, testing new ones, improving customer disclosure and clarifying responsibility.

D. The need to fix securitization

We believe that securitization still is a highly effective way to finance assets. But some securitizations, particularly mortgage securitizations, had an enormous flaw built into them: No one was responsible for the actual quality of the underwriting. Even mortgage servicing contracts were not standardized such that if something went wrong, the customer would get consistent resolution. We cannot rely on market discipline (i.e., eliminating bad practices) alone to fix this problem.

We have heard several reasonable suggestions on how the originator, packager and seller of securitizations could be appropriately incentivized to ensure good underwriting. For example, requiring the relevant parties to keep part of the securitizations, much like we do with syndicated loans today, would help manage resolution if something were to go wrong and could go a long way to re-establish market confidence and proper accountability.

E. The need to fix Basel II — leading to higher capital ratios but a more stable system

As discussed earlier, Basel II has many flaws – it has taken too long to implement, it responds slowly to market changes and it is applied unevenly across global borders. Perhaps its worst failing is that, in its current construct, Basel II does not include liquidity, which allowed commercial and investment banks to buy liquid or illiquid assets and fund them short. While this practice did not appear quite so dangerous in benign times, it created huge issues for many financial institutions during the market crisis. Basel II also has relied too heavily on rating agencies and, by its nature, has been highly pro-cyclical in its capital requirements for assets. It would be easy to make these capital requirements less pro-cyclical and require Basel II to recognize the risk of short-term funding, particularly that of wholesale funding. Finally, Basel II should be applied consistently, reviewed continuously and updated regularly. The world changes quickly.

F. The need to get accounting under control

We at JPMorgan Chase are strong believers in good, conservative accounting. Accounting should always reflect true underlying economics, which actually is how we run the company. However, accounting practices are not widely understood, are changed too frequently and are too susceptible to interpretation and manipulation. Sometimes, they even inadvertently determine U.S. government policy.

We generally like fair value accounting

For assets that are bought and sold, fair value accounting creates the best discipline. Fair value accounting (often referred to as mark-to-market accounting) already provides for some flexibility if recent prices are under highly distressed conditions. In such cases, good judgment and sound fundamental cash flow-type evaluations can be employed to value certain assets. However, in our opinion, the application of fair value accounting for certain categories needs to be reconsidered. For example:

- We now have to mark to market our private equity investments by using potentially artificial benchmarks. These investments, by their nature, are very illiquid and are intentionally held for several years. To mark them to market, proxies made up of comparable companies are used, and appropriate discounts and judgments are applied. Essentially, we write these investments up when markets are good and write them down when markets are bad. But I am fairly confident that this approach is not always right. In many instances, cost is the best proxy for fair value. We would rather describe our investments to our shareholders, tell them when we think these investments might be worth more and, certainly, write them down on our financial statements when they have become impaired.

- A new mark-to-market rule addresses "debit valuation adjustments." Essentially, we now have to mark to market credit spreads on certain JPMorgan Chase bonds that we issue. For example, when bond spreads widen on JPMorgan Chase debt, we actually can book a gain. Of course, when these spreads narrow, we book a loss. The theory is interesting, but, in practice, it is absurd. Taken to the extreme, if a company is on its way to bankruptcy, it will be booking huge profits on its own outstanding debt, right up until it actually declares bankruptcy – at which point it doesn't matter.
- It is becoming increasingly more difficult to compare mark-to-market values of certain instruments across different companies. While it's too involved to go into detail here, different companies may account for similar mark-to-market assets differently. This needs to be addressed by ensuring that companies adhere to consistent valuation principles while applying the rules.
- Fair value accounting does not and should not apply to all assets. Investments or certain illiquid assets that are intended to be held for the longer term (like real estate or plant and equipment) or loans and certain assets that are shorter term (like receivables or inventory) all could actually be marked to market. There are, in fact, markets for some of these assets, and others could be calculated based on reasonable assumptions; for example, a farm would be worth more when corn prices go up, and a semiconductor plant would be worth less when semiconductor prices go down. However, if we marked these assets in this way, they would have wildly different prices depending on the health of the economy or the swings in prices for their output. While accounting should recognize the real impairment in the value of assets, marking the aforementioned assets to market every day would be a waste of time. Under this scenario, it would be quite hard for companies to invest in anything illiquid or to make long-term investments.

New accounting rules that have the potential to inadvertently affect how the capital markets function or change fundamental long-term U.S. government policies should be made thoughtfully, deliberately and with broad input

For example, we all believe that companies should have fully funded pension plans; i.e., the actual assets in the plan should be enough to meet a fair estimate of the liabilities. Years ago, if this wasn't the case, companies were allowed to maintain a "deficit" and fund it over several years. That deficit was not recorded on the financial statement of the company.

A change in accounting rules dictated that the deficit should not just be a footnote in the financial statements but that it should be reflected directly in the equity account of the corporation. Clearly, in very bad markets, these deficits grow dramatically, thus depleting the increasingly precious capital that companies have. (This is just another example of a pro-cyclical force). When companies realized they were getting enormous volatility in their capital account, they began to curtail or eliminate their pension plans in favor of 401(k) plans (where the individual bears all the investment risk). This was a rational, precautionary step. But it, in effect, transferred the risk from the company to the individual. No longer did the large corporations assume the risk of providing a steady income stream to retired employees. Instead, the risk was passed to the individuals – many of whom could not afford it.

This is a perfect example of how accounting inadvertently sets policy. And, in my opinion, this was probably the wrong policy for the country. There would have been many ways to be true to the economic purpose of accounting without making a detrimental policy change. There are countless other examples, and we hope regulators and accountants will eventually find better ways to apply accounting principles.

G. The need for appropriate counter-cyclical policies

During this crisis, it became evident that our system created enormous pro-cyclical tendencies. In fact, I can't think of one counter-cyclical policy at all (other than emergency actions taken by the government).

Accounting policies such as mark-to-market and loan loss reserving are pro-cyclical. Basel II capital requirements are pro-cyclical. Regulatory and legal requirements are pro-cyclical. Repo and short-term financing are pro-cyclical. The one pro-cyclical tendency we probably can never correct is that of the market itself (i.e., the cost of capital goes way up in a downturn or investors refuse to finance less liquid assets). I have heard many good ideas about how to create some counter-cyclical policies and will focus on three here.

Loan loss reserving can easily be made counter-cyclical

I find it absurd that loan loss reserves tend to be at their lowest point precisely when things are about to get worse. As things get worse and charge-offs rise dramatically, one must dramatically increase loan loss reserves, thus depleting capital rapidly. This problem would be solved if banks were allowed to estimate credit losses over the life of their loan portfolios. Reserves should be maintained to absorb those losses. This would enable banks to increase reserves when losses are low and utilize reserves when losses are high. Transparency would be fully preserved because investors and regulators would still see actual charge-offs and nonperformers. This would require a rational explanation about the appropriateness of the lifetime loss estimates. It also would have the positive effect of constantly reminding CEOs, management teams and investors that bad times, in fact, do happen – and that they should be prepared for such events.

Repo and short-term financing can easily be made counter-cyclical

All banks now have access to the standard financing facilities for securities and loans via the Federal Reserve (i.e., the Fed will lend a specific amount of money against specific assets). A suggestion is this: If an institution provides financing to clients in excess of what the Fed would lend to the bank for the same securities, it would have to be disclosed to risk committees and the company's Board of Directors. The Fed then would have two major tools to reduce leverage and in a way that is counter-cyclical – it could charge higher capital costs to a bank when the bank is lending more than the Fed would lend or the Fed could reduce the amount it would lend to the banks. Market players would still be free to provide credit and leverage as they see fit.

Banks should have the ability to implement counter-cyclical capital raising with rapid rights offerings

Banks and possibly other companies would be aided by having the ability to effect rights offerings at a moment's notice. Regulations should facilitate such offerings – with the proper disclosure – in a matter of days rather than weeks. This would allow a company to raise capital and repair a balance sheet that might have been stretched by unanticipated market events and to do so in a manner that is fair and does not dilute the company's existing shareholder base.

H. The need for policies in health care, pensions, energy and the environment, infrastructure and education that will serve us well over time

Beyond the financial crisis, there are several important issues that will dictate whether or not the United States will continue to thrive over the next century. We believe our nation can and should be able to provide health care coverage for all. It is the right thing to do, it will help us build a stronger nation, and, if done properly and efficiently, we believe it ultimately will be cheaper than the current course we are on. On energy, we now have experienced our third major crisis, and we, as a nation, still have not executed a sensible long-term energy policy. Again, we believe that done right, an energy policy could be economically efficient, create great innovation, reduce geopolitical tensions and improve our environment. Similarly, we need to improve our nation's infrastructure and develop an education system that befits our heritage.

We can't fall into the trap of institutional sclerosis – now is the time to act. In the past, this nation has shown the fortitude to work together to accomplish great things, and we need to do that again. For our part, we at JPMorgan Chase are doing everything we can to be helpful to our leaders on all these issues.

V. WHAT COMES NEXT FOR JPMORGAN CHASE

Your management team is deeply engaged and is acting with extreme caution in navigating these uncharted waters. The U.S. Treasury and the Federal Reserve have continued to take bold and dramatic action, as have central banks and governments around the world. In this next section, we will discuss some of the important issues for JPMorgan Chase.

A. Our leadership in mortgage modifications and support for the administration's mortgage programs

JPMorgan Chase is at the forefront of foreclosure prevention and mortgage modifications nationally. Our foreclosure prevention efforts are intended to reach both the $300 billion of loans that we own and the $1.2 trillion of investor-owned loans that we service. We already have helped keep 330,000 borrowers in their homes and expect to help avert 650,000 foreclosures by the end of 2010. We are committed to keeping borrowers in their homes by making sustainable, properly written loan modifications, in many cases before a default occurs.

We believe it is in the best interests of both the homeowner and the mortgage-holder to take corrective action as soon as possible. Our re-default rates are half the rates that the OCC has said are experienced by national servicers. Re-default rates in the industry generally will come down once modifications are done with proper underwriting and as the economy and home prices start to improve. If re-default rates were extremely low, we probably should be doing more modifications.

We strongly support the Obama administration's mortgage modification program. The plan's features are aligned with the program we already had implemented, extending them to more struggling homeowners and providing us and other servicers with more options to keep families in their homes. We also support the program because the guidelines establish a clear, fair and consistent set of standards for all servicers to follow. It is intended for borrowers with mortgages below $729,750; and all borrowers must fully document their income, clearly demonstrate financial hardship and live in the home.

We believe these mortgage modifications are economically and morally the right thing to do and that the program underscores the importance of mutual respect – by treating others in the way that we would like to be treated in the same situation – while upholding the essential principle that individuals, businesses and corporations should repay their loans if they can afford to do so. In our view, its completeness eliminates the need for judicial modification in bankruptcy proceedings. However, if legislated, judicial modifications should be consistent with this plan and focus only on borrowers who either don't qualify or have not been offered a modification. Beyond that, it is time to quickly implement the mortgage modification program – even if it is not perfect in everyone's view – and to move on.

B. Comments on the derivatives business

Derivatives have become an essential and widely used risk management tool. The International Swaps and Derivatives Association estimates that 90% of the Fortune 500, 50% of mid-sized companies and thousands of other, smaller U.S. companies use derivatives to manage certain risks, including currency and interest rate risk. As such, derivatives are a large business for JPMorgan Chase and for firms around the world. It is important to note that derivatives in and of themselves did not cause this crisis. In fact, derivatives have performed fairly well in this crisis environment. However, it is clear that derivatives, at least in financial reporting, are hard to understand, lack transparency and did contribute somewhat to the crisis. At JPMorgan Chase, we believe derivatives, when used properly, play an important role in managing risk, and we are trying to address the concerns about derivatives.

- We have been standard setters in bringing more transparency to our financial reporting and will continue to be. In this report, you will find extensive details on our counterparty exposures and other risk considerations that are central to understanding our derivatives and other trading businesses.
- Some of the concerns about derivatives have to do with the large notional amounts. But those figures are reference measurements and do not reflect actual

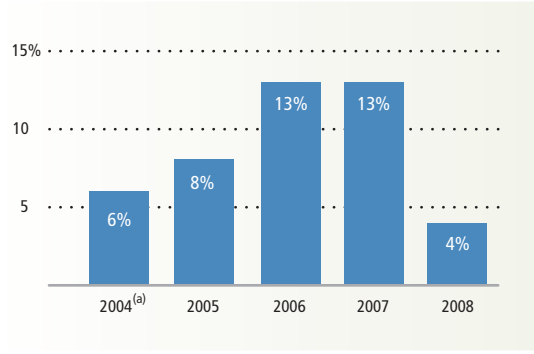
counterparty credit risk. Actual risk is the mark-to-market value of the contract after taking into account netting of risk across all transactions with a counterparty, collateral and hedging. Actual risk projections also take into account the potential future exposure coming from market moves.

- Our counterparty exposures net of collateral and hedges are $133 billion, and the company manages those exposures name by name – like a hawk. The figure is large, but we get paid to take the risks, we reserve and account for them conservatively, and we manage them in conjunction with all of our other credit exposures.
- As the overall amount of counterparty credit risk has grown, so has the concern that this growth has increased systemic risk. To address this issue, we support the development of clearinghouses, which we believe will reduce the counterparty risk and increase transparency for standardized contracts. We already clear a significant portion of our interest rate and commodities derivatives through clearinghouses, and we have been active in the development of a clearinghouse for credit default swaps. Those derivatives that are too customized to be cleared can easily be monitored by regulators to ensure they do not cause systemic risk.
- AIG's downfall wasn't due to its use of derivatives per se but to its poor risk management practices. The insurer took concentrated risks through credit default swaps insuring mortgage-related assets. On the other side of the equation, some dealers bought this insurance from AIG without requiring them to post collateral until such time as their credit rating deteriorated. This is a case where bad risk management on the part of AIG was compounded by bad counterparty risk management by AIG's counterparties. The potential systemic impact was substantial. JPMorgan Chase did business with AIG, but, in line with our general policies, we kept our credit exposure relatively small so that our firm would not be compromised if AIG had been allowed to fail. With hindsight, the problem itself could have been better contained and dramatically mitigated had AIG been properly regulated and required to provide collateral (to a clearinghouse or its counterparties).
- There are regulatory gaps that need serious attention, as was evident with AIG. A way to prevent a future AIG is by empowering a systemic risk regulator (as described earlier). Such a regulator would have been in a position to see the risk piling up and address it before the company failed.
- Recognizing upfront profits for derivative transactions can be problematic. Even though it is not standard accounting, we believe the profits relating to the risk positions associated with derivatives should be booked over the life of the transaction, proportionate to the risk remaining.

With proper management, systemic risks created by derivatives can be dramatically reduced without compromising the ability of companies to use them in managing their exposures.

C. The reasons for maintaining a fortress balance sheet and cutting the dividend

Maintaining a fortress balance sheet will always be essential to us. Our Tier 1 ratio is 10.9%, with tangible common equity of $81 billion, and we will continue to increase our loan loss reserves, as appropriate. With $24 billion in allowance for credit losses at the end of 2008, we believe our loan loss reserves across all our businesses are among the strongest in the industry.



Out of an abundance of caution to be prepared for the future during this uncertain environment, we believed it was prudent to reduce our quarterly dividend from $0.38 to $0.05 per share, effective with our next scheduled dividend payment.

We did not take this action lightly, and we recognize our tremendous obligation to shareholders to seek to maintain dividend levels. But extraordinary times require extraordinary measures. So while our performance and capital are solid, we have an even higher obligation to ensure that our fortress balance sheet remains intact. This will enable us to stay flexible to

Earnings per Share
(fully diluted)

Return on Equity

(a) 2004 data are unaudited pro forma combined, reflecting the merger of JPMorgan Chase and Bank One

seize opportunities and continue to build and invest in our market-leading businesses, even in a highly stressed environment.

We maintain a long-term commitment to the dividend and still view a 30%-40% payout ratio of normalized earnings as ultimately reasonable. We will continue to review all relevant criteria to ensure the ongoing strength of our capital base and will await a more stable economic environment before increasing the dividend.

D. Comments on TARP

While the decision to reduce our dividend was not directly related to accepting TARP, it does provide us with additional capital – about $5 billion per year – which could position us to repay TARP funds sooner than otherwise would have been possible. We, of course, would do this in consultation with our regulators.

Many people would like us to repay the TARP funds as soon as we can; some are angry over the changing government conditions relating to the acceptance of TARP funds; and some would like to see swift repayment as a matter of principle.

The reason we accepted TARP still stands – we believed it was in the best interests of the United States and the banking system overall. We will not react capriciously or out of anger in determining when to repay the TARP funds. We will repay them only if doing so is consistent with the best interests of our country and our company.

E. The impact of a deep recession, and the government's stress test

We have been forthright and consistent in letting our shareholders know that a recession will impact our financial results, a severe recession even more so. And that's if we do everything right. Last year, we noted that the recession would have a significant impact on credit and that in a difficult environment, "credit losses could rise significantly, by as much as $5 billion over time, which would require increases in loan loss reserves." Managed net charge-offs were $13 billion in 2008, up from $7 billion in 2007. Our current view is that 2009 charge-offs will be even higher.

The recession will ripple through and affect all of our consumer and commercial credit exposures – some worse than others. In addition to higher charge-offs, it will require substantial additions to reserves, which we have increased from $10 billion at the end of 2007 to $24 billion at the end of 2008. We already said last year how bad we thought mortgage and home equity losses might get, and, unfortunately, they have become even worse. The severity of this recession also could have a dramatic impact on credit card losses; we now expect a 9% unemployment rate to lead to charge-offs of higher than 9%. (In the past, we would expect unemployment of 9% to lead to charge-offs of 7% or more. Now, however, we believe that the combined effect of unemployment with the major housing downturn will lead to a higher charge-off rate.)

The Treasury, in conjunction with the OCC, FDIC and Federal Reserve, has launched a stress test program to ensure that the 19 largest banks (those with more than

$100 billion in assets) have the capacity to remain properly capitalized in a highly stressed environment. The government's adverse economic environment envisions a two-year recession, where unemployment reaches 10.4% and the housing price index declines 48% from peak to trough. While some banks may need additional capital or support, a successful completion of the stress test program should eliminate the need to guess which banks are properly capitalized and which are not. In the best case, it will affirm the banks' capital, accounting and reserve ratios, which will remove uncertainty in the marketplace and increase financial stability. (Unfortunately, the announcement of the stress test, which is expected to be presented in late April, is causing enormous consternation in the markets that would have been better to avoid.)

We regularly do stress tests for our company, always projecting forward our capital and liquidity. We think our capital ratios will maintain their extremely strong levels throughout the government's "adverse economic environment."

You also should know that your company will be prepared for an environment even worse than the one just described.

F. Recent government actions and the potential power of concerted efforts

Governments around the world have taken dramatic actions during this crisis. The Federal Reserve and Treasury of the United States have provided $5 trillion of liquidity facilities to finance various types of assets and – to stabilize individual companies and the overall system – have guaranteed almost $1 trillion of assets on the balance sheets of certain institutions and injected $1 trillion of capital into the financial system. In addition, the government is trying to reduce the mortgage rate by buying mortgages, making it easier to refinance; reducing consumer payments; and aggressively pushing mortgage modification programs. We believe the recent Term Asset-Backed Securities Loan Facility, or TALF program, which allows private investors to get non-recourse financing on asset-backed securities, will aid the securitization markets. This program eventually may lend up to $1 trillion to finance new securitized loans. It can also be modified and extended as appropriate. It should be noted that many of the government's programs are not only replacing bank lending but are also filling the gaps left by many of the nonbank lenders in the capital markets.

We know that these government actions will have unintended consequences and can lead to political interference and that we will need to remove these forms of support over time, intelligently. All these concerns add to our worries, particularly about potential future inflation, but we'll reserve such a discussion for another time.

There is no silver bullet: We believe that all of these actions, if implemented properly and executed – in a timely way and in conjunction with the U.S. fiscal stimulus program – could have an enormous positive impact. The sum of the parts can be a lot more powerful than each individual action.

We see that the largest global economic downturn is being met with massive global government actions – and while the specific outcome is uncertain, there is good reason to think that the governments will eventually win.

This country has had its defining moments: the Civil War; the Great Depression; World War II. This may also be one of them. President Abraham Lincoln said, "A house divided against itself cannot stand." Just as our military acts in concert – across the Army, Navy, Air Force and Marines, under one commander-in-chief – now, so too, should we. This means coordination across the House and Senate, Democrats and Republicans. If we rise to the challenge now, *we will prevail.*

VI. GETTING COMPENSATION RIGHT IS CRITICAL

Looking back at last year, I continue to reflect on how proud I am of the people in this company. It often is in the toughest of times that one learns what people are really made of. Our employees worked harder than ever and performed admirably for the company, for our clients and even for our country under enormously challenging conditions. Throughout the unexpected events and incredible pressure of 2008, it was hard not to be impressed by the intellect, work ethic and strength of character of the individuals at this firm.

I know many Americans are concerned about compensation practices across the financial services industry, and many of the concerns are quite legitimate. At JPMorgan Chase, we believe we have been at the forefront of sensible compensation practices. Our process is disciplined and rigorous, and we have always sought to reward the long-term performance of our employees. Our practices reflect this:

- We pay our people for performing well over multiple years and for helping to build a company with long-term, sustainable performance.
- In looking at performance, we always try to properly account for risk being taken. We are also mindful that a rising tide lifts all boats, and we do not want to pay people on that basis.
- Performance to us has never been simply a financial measure. It has always included the broader contribution a person brings to a company, such as maintaining integrity and compliance; recruiting and training a diverse, outstanding workforce; and building better systems and innovation.
- We have had in place a bonus recoupment policy beyond that required by Sarbanes-Oxley.
- We don't have: change-of-control agreements, special executive retirement plans, golden parachutes, special severance packages for senior executives or merger bonuses.
- We have always paid a significant percentage of our incentive compensation in stock, approximately 50% for our senior management team. That stock vests over multiple years.
- Our senior management team generally must retain and hold approximately 75% of all stock ever received from the company.

There are a lot of legitimate complaints about compensation – not just at financial firms but at all types of companies. Good companies know that compensation can cause bad incentives. They know there is no magic to a calendar year and that they must be careful not to pay people too much in a current year – due to either exuberance or real market pressures. Compensation is one of the most complex issues we deal with because it is important to the individuals and the company. Improperly done, it can destroy a company. We strive mightily to hire, train and retain the best talent – smart, ethical, hard-working, entrepreneurial individuals – and getting compensation right is a critical part of this process.

We believe we have a deep responsibility to you, our shareholders, and to our creditors, our clients and all our employees. We work incredibly hard to uphold all our obligations every day.

Our commitment to corporate citizenship

We have always been deeply committed to being good corporate citizens. It is an essential part of what we do – and who we are – as a firm. As such, we have intensified our corporate responsibility efforts, directing resources to make a meaningful difference to the people who live and work in the communities in which we operate.

While some may think of us as a Wall Street firm, we also are very much a part of Main Street: We employ 225,000 people worldwide in 48 U.S. states and more than 60 countries. Our 5,000 branches serve customers in 23 states. We provide health care coverage for 400,000 people. On average, we pay more than $10 billion a year in taxes to the U.S. government, as well as to state and local jurisdictions.

Last year alone, our firm and our Foundation made charitable contributions of approximately $100 million in our markets across the United States. And over the past five years, we have given more than $600 million to 13,500 organizations globally. These tremendously important investments help inner-city young adults get jobs, fund educational programs, build affordable housing and support rebuilding efforts after a tsunami, earthquake or hurricane hits one of our global communities. Our people are devoted to the communities they serve – and, in a mutually beneficial relationship, we thrive when those communities are healthy, secure and prosperous.

The Way Forward: Stepping up our game

We strive to help our clients and our customers in every way – and especially during these difficult times. This overall effort, part of an initiative called The Way Forward, represents our commitment to the actions we have taken and are willing to take to move America and the global economy forward.

Throughout our history, we have always believed that our obligation extends beyond simply serving shareholders, clients and employees. For us, public service means working with government officials, in a nonpartisan way, to fully identify, analyze and overcome our problems. We believe the right solutions come only when we participate in a constructive dialogue, get beyond the words, "It's not politically feasible," and take bold steps.

Ensuring the health and vibrancy of this company for the next 200 years is paramount

The real measure of strength for a country – or a company – is not whether we have problems but how we learn from them, overcome them and emerge better for it. For more than 200 years, the world has turned to JPMorgan Chase in times of difficulty and turmoil, counting on our people to support our country, our clients and our communities around the world. We feel that obligation more intensely than ever and are focused on doing everything in our power to make sure this company remains strong, healthy and vibrant so that it can continue to do what it does best for the next 200 years.

Jamie Dimon
Chairman and Chief Executive Officer

March 23, 2009

Investment Bank

Throughout the global credit crisis, J.P. Morgan's Investment Bank has actively supported our clients' financing and liquidity needs. In 2008, we provided more than $300 billion in loans to companies and over $11 billion in credit to states, municipalities, hospitals and higher education institutions. We also helped our clients raise billions more in the capital markets.

J.P. Morgan is one of the world's leading investment banks with one of the most extensive client franchises in the world. Our scale and global footprint enable us to help our clients address their full range of financial needs.

We offer clients a complete platform of financial services, including strategic advice, capital raising, restructuring, risk management, market-making and research. We cover clients in more than 100 countries and have global leadership positions in every key product. J.P. Morgan also selectively commits our own capital to principal investing and trading activities.

2008 Highlights and Accomplishments

- First investment bank in history to be ranked #1 in global investment banking fees[(a)]; debt, equity and equity-related[(b)]; announced M&A[(a)]; equity and equity-related[(b)]; debt[(b)]; as well as loans.[(b)]
- Led the market with more than $300 billion in corporate loans to over 630 companies; the firm's average loan size was roughly $475 million, significantly higher than the market's average size of $400 million.[(b)]
- Renewed, restructured or developed new credit facilities totaling over $11 billion for states, municipalities, hospitals and higher education institutions. The firm also led or participated in the issuance of more than $700 billion in bonds for municipal clients.[(c)]
- The only bank ever to win six top *International Financing Review* awards in one year: Bank of the Year, Bond House of the Year, Equity House of the Year, Derivatives House of the Year, Securitisation House of the Year and Leveraged Finance House of the Year.
- *Risk* magazine's Bank Risk Manager of the Year and Derivatives House of the Year, and *Financial News*' European Investment Bank of the Year.
- Received 15 Greenwich Associates' 2008 Quality Leader distinctions, more than any other firm.
- Client revenue across J.P. Morgan's Markets businesses increased 40% year-over-year:
  - Record performance in Rates and Currencies, Commodities and Emerging Markets.
- Prime Services acquired from Bear Stearns more than doubled the number of $1 billion+ relationships from June to December.
- Reduced legacy leveraged lending funded and unfunded commitments by 52% and mortgage-related exposures by 69% since year-end 2007, while integrating the Bear Stearns portfolio.
- Gross investment banking revenue from Commercial Banking clients of $1 billion, up 9% from 2007.

Retail Financial Services

Retail Financial Services serves consumers and businesses through personal service at bank branches and through ATMs, online banking and telephone banking as well as through retail mortgage correspondents, auto dealerships and school financial aid offices.

Customers can use more than 5,000 bank branches (third largest nationally) and 14,500 ATMs (second largest nationally) as well as online and mobile banking around the clock. More than 21,400 branch salespeople assist customers with checking and savings accounts, mortgages, home equity and business loans, and investments across the 23-state footprint from New York and Florida to California. Consumers also can obtain loans through more than 16,000 auto dealerships and 4,800 schools and universities nationwide.

2008 Highlights and Accomplishments

- Expanded branch network to more than 5,000 with addition of Washington Mutual branches in new Chase markets such as California and Florida as well as strengthening our network in New York Tri-State, Texas, Illinois and Arizona.
- Increased deposits to more than $360 billion.
- Generated retail banking net revenue of $4.5 billion in the fourth quarter – the first quarter that included WaMu.
- Made key decisions about systems, facilities and people in first three months after WaMu acquisition – and began to implement them.
- Added more than 7,700 personal bankers, business bankers, investment representatives and mortgage officers, including 7,000 from WaMu, to the branches.
- Increased in-branch sales of credit cards 14% excluding WaMu or 20% including WaMu.
- Increased Chase checking accounts 9% – or 1.1 million – and added 12.6 million checking accounts from WaMu for a total of 24.5 million.
- Opened 126 new Chase and WaMu branches and added more than 5,300 ATMs, including 5,000 from the WaMu acquisition.
- Increased third-party mortgage servicing portfolio 91%, including the addition of the WaMu and EMC portfolios.
- Launched extensive efforts to keep families in their homes whenever possible in leading The Way Forward. Efforts included adding hundreds of loan counselors, making proactive loan modification offers, developing robust financial modeling tools and working with government agencies on streamlined modification programs.
- Opened in early 2009 a total of 24 Homeownership Centers in areas with high mortgage delinquencies so counselors can work face to face with struggling homeowners.

As consumers faced financial uncertainty and challenging mortgage payments, Chase honored 100% of Washington Mutual's deposits – including uninsured deposits – and seeks to help avert more than 650,000 foreclosures, keeping families in their homes whenever possible.

Card Services

Chase Card Services is one of the nation's largest credit card issuers with more than 168 million credit cards in circulation and over $190 billion in managed loans. Customers used Chase cards to meet more than $368 billion worth of their spending needs in 2008.

Chase has a market leadership position in building loyalty and rewards programs with many of the world's most respected brands and through its proprietary products, which include the Chase Freedom program. Through its merchant acquiring business, Chase Paymentech, Chase is one of the leading processors of MasterCard and Visa payments.

2008 Highlights and Accomplishments

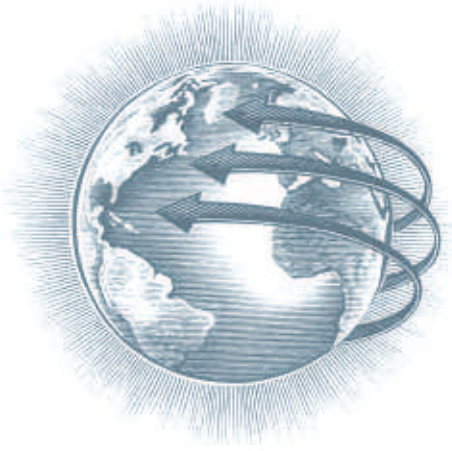
- Became the nation's leading MasterCard and Visa issuer with the acquisition of WaMu.
- Added 14.9 million new Visa, MasterCard and private label credit card accounts (excluding WaMu).
- Renewed relationships with several top card partners, including AARP, Continental Airlines, The Walt Disney Company, Marriott International and United Airlines.
- Continued to drive improvements in acquisitions through the retail bank network, resulting in a 14% year-over-year increase of credit cards sold.
- Increased year-over-year charge volume by more than $14 billion in extremely challenging economic environment for U.S. consumers.
- Increased net revenue by 8% and grew managed loans by 3% (excluding WaMu) while investing in activities to attract new customers and further engage current cardmembers.
- Acquired complementary merchant acquiring business through the termination of the Chase Paymentech Solutions joint venture.
- Expanded non-U.S. presence by launching partner card programs in Canada and establishing a joint venture with Ixe Banco in Mexico.
- Continued improvements in risk management, customer satisfaction, and systems and infrastructure.

Card Services offers customers clear and simple tools, resources and business practices designed to help customers avoid fees, maintain their best interest rates and more effectively manage their credit card accounts.

Commercial Banking

By extending more than $32 billion in credit to clients in municipalities, not-for-profit organizations, health care facilities and higher education institutions – a 50% increase over the previous year – and allocating an incremental $5 billion for 2009, we continue our support of local communities and the U.S. economy.

Commercial Banking (CB) serves more than 26,000 clients nationally, including corporations, municipalities, financial institutions and not-for-profit entities with annual revenue generally ranging from $10 million to $2 billion, and nearly 30,000 real estate investors/owners. CB ranks among the Top 3 commercial banks nationally in market penetration and lead share.[a]



Delivering extensive industry knowledge, local expertise and dedicated service, CB partners with the firm's other businesses to provide comprehensive solutions, including lending, treasury services, investment banking and asset management to meet its clients' domestic and international financial needs.

2008 Highlights and Accomplishments

- Increased net income 27% to a record $1.4 billion and net revenue 16% to a record $4.8 billion.
- Achieved record results in gross investment banking revenue of $966 million, treasury services revenue of $2.6 billion, loan balances of $82.3 billion and liability balances of $103.1 billion.
- Top 3 commercial bank nationally in market penetration and lead share.[a]
- #2 large middle market lender in the United States.[b]
- Added in excess of 1,800 new relationships and expanded nearly 10,000 existing relationships through targeted calling and strategic marketing efforts.
- Maintained favorable market position relative to our peers in the key areas of risk management, profitable growth, expense discipline and deposit growth.
- Acquired WaMu's Commercial Term Lending, Commercial Real Estate Lending and Community Lending & Investment businesses representing $44.5 billion in loans, and expect to complete the integration by early 2010.
- Aligned the domestic middle market banking and treasury services sales forces, providing more effective client coverage while improving efficiency.

Treasury & Securities Services

During the financial crisis, Treasury & Securities Services (TSS) has actively worked with our clients to fully optimize their working capital, manage their collateral and help mitigate their risk effectively. Most recently, TSS was proud to be selected by the Federal Reserve as custodian for its program to purchase up to $500 billion in mortgage-backed securities aimed at supporting mortgage and housing markets and fostering improved conditions in financial markets.

J.P. Morgan's Treasury & Securities Services division is a global leader in transaction, investment and information services. We are one of the world's largest cash management providers, processing a market-leading average of $3.7 trillion in U.S. dollar transfers daily as well as a leading global custodian with $13.2 trillion in assets under custody. We operate through two divisions:

Treasury Services provides cash management, trade, wholesale card and liquidity products and services to small- and mid-sized companies, multinational corporations, financial institutions and government entities.

Worldwide Securities Services holds, values, clears and services securities, cash and alternative investments for investors and broker-dealers and manages depositary receipt programs globally.

2008 Highlights and Accomplishments

- Named top Global Custodian *(AsianInvestor, Global Pensions, The Asset, International Custody and Fund Administration)*; received more than 110 best-in-class recognitions (*Global Custodian*); named European Cash Management Provider of the Year *(International Custody and Fund Administration)*; awarded Best Cash Management Specialist (*The Asset*).
- #1 in Automated Clearing House Originations[(a)] and in U.S. Dollar Treasury Clearing and Commercial Payments Globally.[(b)]
- Increased net income 26% year-over-year to a record $1.8 billion and net revenue 17% to a record $8.1 billion.
- Grew revenue 15% outside the U.S. and further strengthened our international presence with expanded services offered in over 20 countries throughout Europe, the Middle East, Africa, Asia and Latin America.
- Remained #1 clearer of U.S. dollars globally, averaging $3.7 trillion in U.S. dollar transfers daily. Broke single-day clearing volume record by clearing $5.05 trillion, 59% over the bank's average.
- Announced global investment initiative to enhance cash management and global treasury liquidity capabilities, expand global footprint and reinvest in technology solutions to make it easier for clients to move, concentrate, invest and manage their cash worldwide.
- Completed acquisition of the institutional global custody portfolio of Nordea; J.P. Morgan is the region's leading non-Nordic global custodian.
- Major new business included a deal to provide asset pooling services for Royal Dutch Shell and to provide SmartPay Charge card services to the U.S. General Services Administration covering nearly 35 federal agencies and organizations with a projected annual spend of more than $4.5 billion.

Asset Management

Asset Management, with assets under supervision of $1.5 trillion, is a global leader in investment and wealth management. Our clients include institutions, retail investors and high-net-worth individuals in every major market throughout the world.

We offer global investment management in equities, fixed income, real estate, hedge funds, private equity and liquidity. We provide trust and estate, banking and brokerage services to high-net-worth clients and retirement services for corporations and individuals.

2008 Highlights and Accomplishments

- J.P. Morgan Asset Management liquidity balances grew more than 50% in 2008 to $613 billion, retaining its position as the largest manager of Triple A-rated global liquidity funds. Global Institutional market share grew to 17%, almost twice that of the next competitor.[a]
- Private Banking achieved record net new asset flows of approximately $80 billion throughout the course of the year as high-net-worth individuals around the world chose J.P. Morgan as their wealth manager. Private Banking benefited from a record year of net new clients and net new assets and achieved a 7% revenue growth year-on-year.
- J.P. Morgan Asset Management retained its position as one of the largest managers of hedge funds with $32.9 billion in assets under management.[b]
- Through our Global Real Assets group, J.P. Morgan Asset Management invests client capital in infrastructure projects that are vital to the economic health of communities around the world. Over the past few years, we have invested client capital in projects that include airports, hospitals, drinking and wastewater facilities, and renewable energy (such as wind farms, electricity transmission, and natural gas generation and transmission facilities) valued in excess of $4 billion. The Global Real Assets group recently expanded its footprint with the addition of the Asia infrastructure team and now manages $51 billion of real estate and infrastructure across the United States, Europe and Asia.
- Despite the challenging market environment throughout the year, maintained strong three- and five-year investment performance. Globally, the ranking of long-term mutual fund assets in the first or second quartiles was 76% for the five years and 65% for the three years ended December 31, 2008.[c]

(c) Derived from the following rating services: Lipper for the United States and Taiwan; Micropal for the United Kingdom, Luxembourg and Hong Kong; and Nomura for Japan

Throughout the credit crisis, considerable strain on short-term debt markets threatened the viability of money market funds – critical to the day-to-day functioning of the global economy. J.P. Morgan worked closely with industry groups and regulators around the world to help protect these funds and stabilize the industry.

Corporate Responsibility

Our commitment to corporate responsibility extends to every facet of our business – in both good economic times and bad. We are proactively assisting customers and clients as well as supporting efforts to achieve financial market stability throughout these unprecedented economic times. As we look to the future, we remain committed to doing business in a responsible way, to being responsible stewards of shareholder capital and to being a good corporate partner to our communities across the globe.

At JPMorgan Chase, corporate responsibility is about what we do every day in our businesses and how we do it. We are committed to managing our businesses to create value for our consumer and corporate clients as well as our shareholders, communities and employees and to being a responsible corporate citizen.

2008 Highlights and Accomplishments

- Took numerous steps to help stabilize the U.S. financial system, including significantly enhancing mortgage modification and home foreclosure prevention efforts and ongoing lending to consumers, businesses, municipalities and not-for-profits as well as acquiring Bear Stearns and Washington Mutual.
- Invested more than $450 billion in low- and moderate-income communities in the first five years of our 10-year, $800 billion public commitment and also earned the highest possible rating of "Outstanding" in our latest Community Reinvestment Act examination.
- Brought financial services to microfinance enterprises via advisory services and principal investing. Sponsored Grameen Foundation's Bankers without Borders, a new program linking private sector talent with the microfinance sector.
- Spent over $1 billion with diverse suppliers for the first time in our history.
- Committed to reducing our greenhouse gas emissions 20% by 2012. Began program that will purchase carbon credits to offset 100% of the carbon dioxide resulting from employee global air travel.
- Have $2.4 billion invested in renewable energy projects and raised another $3.4 billion from other institutions for investment. Portfolio includes interests in 54 wind farms as well as several solar projects that together can power close to 1.5 million U.S. homes annually.
- Adopted and published the JPMorgan Chase Human Rights Statement in support of the fundamental principles of human rights.
- Strategically invested more than $100 million and contributed thousands of employee volunteer hours in high-need neighborhoods across the U.S. while supporting hundreds of not-for-profits that are strengthening communities we serve in 28 other countries.

(a) Results for 2008 and 2004 included an accounting conformity loan loss reserve provision related to the acquisition of Washington Mutual Bank's banking operations and the merger with Bank One Corporation, respectively.

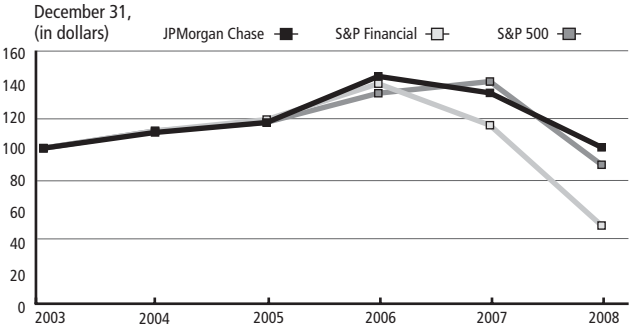
(b) The income tax benefit in 2008 is the result of the release of previously established deferred tax liabilities on non-U.S. earnings and business tax credits.

(c) On October 1, 2006, JPMorgan Chase & Co. completed the exchange of selected corporate trust businesses for the consumer, business banking and middle-market banking businesses of The Bank of New York Company Inc. The results of operations of these corporate trust businesses are being reported as discontinued operations for each of the periods presented.

(d) Effective September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank for $1.9 billion. The fair value of the net assets acquired exceeded the purchase price which resulted in negative goodwill. In accordance with SFAS 141, nonfinancial assets that are not held-for-sale were written down against that negative goodwill. The negative goodwill that remained after writing down nonfinancial assets was recognized as an extraordinary gain in 2008.

(e) JPMorgan Chase's common stock is listed and traded on the New York Stock Exchange, the London Stock Exchange Limited and the Tokyo Stock Exchange. The high, low and closing prices of JPMorgan Chase's common stock are from The New York Stock Exchange Composite Transaction Tape.

(f) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the merger with The Bear Stearns Companies, Inc. was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.



(g) On July 1, 2004, Bank One Corporation merged with and into JPMorgan Chase. Accordingly, 2004 results include six months of the combined Firm's results and six months of heritage JPMorgan Chase results.

FIVE-YEAR STOCK PERFORMANCE

The following table and graph compare the five-year cumulative total return for JPMorgan Chase & Co. ("JPMorgan Chase" or the "Firm") common stock with the cumulative return of the S&P 500 Stock Index and the S&P Financial Index. The S&P 500 Index is a commonly referenced U.S. equity benchmark consisting of leading companies from different economic sectors. The S&P Financial Index is an index of 81 financial companies, all of which are within the S&P 500. The Firm is a component of both industry indices.

The following table and graph assumes simultaneous investments of $100 on December 31, 2003, in JPMorgan Chase common stock and in each of the above S&P indices. The comparison assumes that all dividends are reinvested.

December 31, (in dollars)	2003	2004	2005	2006	2007	**2008**
JPMorgan Chase	$ 100.00	$ 109.92	$ 116.02	$ 145.36	$ 134.91	**$ 100.54**
S&P Financial Index	100.00	110.89	118.07	140.73	114.51	**51.17**
S&P 500	100.00	110.88	116.33	134.70	142.10	**89.53**

This section of the JPMorgan Chase's Annual Report for the year ended December 31, 2008 ("Annual Report") provides management's discussion and analysis of the financial condition and results of operations ("MD&A") of JPMorgan Chase. See the Glossary of terms on pages 230–233 for definitions of terms used throughout this Annual Report. The MD&A included in this Annual Report contains statements that are forward-looking within the meaning of the Private Securities Litigation Reform Act of 1995. Such statements are based upon the current beliefs and expectations of JPMorgan Chase's management and are subject to significant risks and uncertainties. These risks and uncertainties could cause JPMorgan Chase's results to differ materially from those set forth in such forward-looking statements. Certain of such risks and uncertainties are described herein (see Forward-looking statements on page 127 of this Annual Report) and in the JPMorgan Chase Annual Report on Form 10-K for the year ended December 31, 2008 ("2008 Form 10-K"), in Part I, Item 1A: Risk factors, to which reference is hereby made.

INTRODUCTION

JPMorgan Chase & Co., a financial holding company incorporated under Delaware law in 1968, is a leading global financial services firm and one of the largest banking institutions in the United States of America ("U.S."), with $2.2 trillion in assets, $166.9 billion in stockholders' equity and operations in more than 60 countries as of December 31, 2008. The Firm is a leader in investment banking, financial services for consumers and businesses, financial transaction processing and asset management. Under the J.P. Morgan and Chase brands, the Firm serves millions of customers in the U.S. and many of the world's most prominent corporate, institutional and government clients.

JPMorgan Chase's principal bank subsidiaries are JPMorgan Chase Bank, National Association ("JPMorgan Chase Bank, N.A."), a national banking association with branches in 23 states in the U.S.; and Chase Bank USA, National Association ("Chase Bank USA, N.A."), a national bank that is the Firm's credit card issuing bank. JPMorgan Chase's principal nonbank subsidiary is J.P. Morgan Securities Inc., the Firm's U.S. investment banking firm.

JPMorgan Chase's activities are organized, for management reporting purposes, into six business segments, as well as Corporate/Private Equity. The Firm's wholesale businesses comprise the Investment Bank, Commercial Banking, Treasury & Securities Services and Asset Management segments. The Firm's consumer businesses comprise the Retail Financial Services and Card Services segments. A description of the Firm's business segments, and the products and services they provide to their respective client bases, follows.

Investment Bank

J.P. Morgan is one of the world's leading investment banks, with deep client relationships and broad product capabilities. The Investment Bank's clients are corporations, financial institutions, governments and institutional investors. The Firm offers a full range of investment banking products and services in all major capital markets, including advising on corporate strategy and structure, capital raising in equity and debt markets, sophisticated risk management, market-making in cash securities and derivative instruments, prime brokerage and research. The Investment Bank ("IB") also selectively commits the Firm's own capital to principal investing and trading activities.

Retail Financial Services

Retail Financial Services ("RFS"), which includes the Retail Banking and Consumer Lending reporting segments, serves consumers and businesses through personal service at bank branches and through ATMs, online banking and telephone banking as well as through auto dealerships and school financial aid offices. Customers can use more than 5,400 bank branches (third-largest nationally) and 14,500 ATMs (second-largest nationally) as well as online and mobile banking around the clock. More than 21,400 branch salespeople assist

customers with checking and savings accounts, mortgages, home equity and business loans, and investments across the 23-state footprint from New York and Florida to California. Consumers also can obtain loans through more than 16,000 auto dealerships and 4,800 schools and universities nationwide.

Card Services
Chase Card Services ("CS") is one of the nation's largest credit card issuers with more than 168 million cards in circulation and more than $190 billion in managed loans. Customers used Chase cards to meet more than $368 billion worth of their spending needs in 2008. Chase has a market leadership position in building loyalty and rewards programs with many of the world's most respected brands and through its proprietary products, which include the Chase Freedom program.

Through its merchant acquiring business, Chase Paymentech Solutions, Chase is one of the leading processors of MasterCard and Visa payments.

Commercial Banking
Commercial Banking ("CB") serves more than 26,000 clients nationally, including corporations, municipalities, financial institutions and not-for-profit entities with annual revenue generally ranging from $10 million to $2 billion, and nearly 30,000 real estate investors/owners. Delivering extensive industry knowledge, local expertise and dedicated service, CB partners with the Firm's other businesses to provide comprehensive solutions, including lending, treasury services, investment banking and asset management to meet its clients' domestic and international financial needs.

Treasury & Securities Services
Treasury & Securities Services ("TSS") is a global leader in transaction, investment and information services. TSS is one of the world's largest cash management providers and a leading global custodian. Treasury Services ("TS") provides cash management, trade, wholesale card and liquidity products and services to small and mid-sized companies, multinational corporations, financial institutions and government entities. TS partners with the Commercial Banking, Retail Financial Services and Asset Management businesses to serve clients firmwide. As a result, certain TS revenue is included in other segments' results. Worldwide Securities Services ("WSS") holds, values, clears and services securities, cash and alternative investments for investors and broker-dealers, and manages depositary receipt programs globally.

Asset Management
Asset Management ("AM"), with assets under supervision of $1.5 trillion, is a global leader in investment and wealth management. AM clients include institutions, retail investors and high-net-worth individuals in every major market throughout the world. AM offers global investment management in equities, fixed income, real estate, hedge funds, private equity and liquidity, including money market instruments and bank deposits. AM also provides trust and estate, banking and brokerage services to high-net-worth clients, and retirement services for corporations and individuals. The majority of AM's client assets are in actively managed portfolios.

This overview of management's discussion and analysis highlights selected information and may not contain all of the information that is important to readers of this Annual Report. For a complete description of events, trends and uncertainties, as well as the capital, liquidity, credit and market risks, and the critical accounting estimates affecting the Firm and its various lines of business, this Annual Report should be read in its entirety.

Financial performance of JPMorgan Chase

Year ended December 31, (in millions, except per share and ratio data)	2008[c]	2007	Change
Selected income statement data			
Total net revenue	**$ 67,252**	$ 71,372	(6)%

Income before extraordinary gain	**2%**	13%	
Net income	**4%**	13%	

(a) Includes an accounting conformity provision for credit losses of $1.5 billion related to the acquisition of Washington Mutual Bank's banking operations in 2008.

(b) JPMorgan Chase acquired the banking operations of Washington Mutual Bank from the Federal Deposit Insurance Corporation ("FDIC") for $1.9 billion. The fair value of the net assets acquired from the FDIC exceeded the purchase price which resulted in negative goodwill. In accordance with SFAS 141, nonfinancial assets that are not held-for-sale were written down against that negative goodwill. The negative goodwill that remained after writing down nonfinancial assets was recognized as an extraordinary gain in 2008. The allocation of the purchase price to the net assets acquired (based on their respective fair values at September 25, 2008) and the resulting negative goodwill may be modified through September 25, 2009, as more information is obtained about the fair value of assets acquired and liabilities assumed.

(c) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the merger with The Bear Stearns Companies, Inc. was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.

Business overview

JPMorgan Chase reported 2008 net income of $5.6 billion, or $1.37 per share, and total net revenue of $67.3 billion, compared with record net income of $15.4 billion, or $4.38 per share, and record total net revenue of $71.4 billion, for 2007. Return on common equity was 4% in 2008, compared with 13% in 2007. Results in 2008 include the acquisition of The Bear Stearns Companies Inc. ("Bear Stearns") on May 30, 2008, and the acquisition of the banking operations of Washington Mutual Bank ("Washington Mutual") on September 25, 2008.

The decline in net income for the year was the result of a significantly higher provision for credit losses, reflecting the addition of $13.7 billion to the Firm's allowance for credit losses in 2008; a decline in total net revenue driven by over $10 billion of markdowns on mortgage-related positions and leveraged lending exposures in the Investment Bank; and an increase in total noninterest expense due to the impact of the Washington Mutual transaction and the Bear Stearns merger.

The business environment for financial services firms was extremely challenging in 2008. The global economy slowed, with many countries, including the U.S., slipping into recession. Financial conditions worsened throughout the year amid a number of unprecedented developments that undermined the economic outlook and eroded confidence in global financial markets. JPMorgan Chase acquired Bear Stearns through a merger consummated in May and acquired the banking operations of Washington Mutual from the Federal Deposit Insurance Corporation ("FDIC") in September. The U.S. federal government placed the Federal Home Loan Mortgage Corporation ("Freddie Mac") and the Federal National Mortgage Association ("Fannie Mae") under its control. Lehman Brothers Holdings Inc. declared bankruptcy. The Bank of America Corporation acquired Merrill Lynch & Co., Inc. and Wells Fargo & Company acquired Wachovia Corporation. The government provided a loan to American International Group, Inc. ("AIG") in exchange for an equity interest in AIG to prevent the insurer's failure. Morgan Stanley, The Goldman Sachs Group, Inc., GMAC, American Express, Discover Financial Services and CIT Group received approval from the Board of Governors of the Federal Reserve System (the "Federal Reserve") to become federal bank holding companies. In other industries, the U.S. government provided temporary loans to General Motors Corporation and Chrysler LLC.

These events accompanied severe strains in term funding markets, reflecting heightened concerns about counterparty risk. As a result, LIBOR rates rose significantly in the fall, despite a round of coordinated rate cuts by a number of central banks. By year-end, LIBOR rates eased in response to proposals to insure deposits and selected debt of financial institutions. The turmoil in financial markets during 2008 led to tighter credit conditions and diminished liquidity, causing consumers and businesses around the world to become more cautious and curtail spending and investment activity. As a result, the U.S. economy contracted sharply, 2.8 million jobs were lost in 2008, and the U.S. unemployment rate rose significantly, to 7.2% by year-end.

The continued economic and financial disruption led the Federal Reserve to reduce its target overnight interest rates to near zero in the fourth quarter of 2008, capping off a year of near-continuous rate reductions. In addition, the U.S. Department of the Treasury (the "U.S. Treasury"), the Federal Reserve and the FDIC, working in cooperation with foreign governments and other central banks, including the Bank of England, the European Central Bank and the Swiss National Bank, began, in the fourth quarter of 2008, to take a variety of extraordinary measures designed to restore confidence in the financial markets and strengthen financial institutions, including capital injections, guarantees of bank liabilities and the acquisition of illiquid assets from banks. In particular, on October 3, 2008, the Emergency Economic Stabilization Act of 2008 (the "EESA") was signed into law. Pursuant to the EESA, the U.S. Treasury has the authority to take a range of

actions to stabilize and provide liquidity to the U.S. financial markets, including the purchase by the U.S. Treasury of certain troubled assets from financial institutions (the "Troubled Asset Relief Program") and the direct purchase by the U.S. Treasury of equity of financial institutions (the "Capital Purchase Program").

The efforts to restore confidence in the financial markets and promote economic growth continue in 2009, with initiatives including a fiscal stimulus bill, the American Reinvestment and Recovery Act of 2009, which was signed into law by President Barack Obama on February 17, 2009. Also in February, the U.S. Treasury outlined a plan to restore stability to the financial system and President Obama proposed a plan to help distressed homeowners. The Federal Reserve, working with other government and regulatory agencies, has also implemented a number of new programs to promote the proper functioning of the credit markets and reintroduce liquidity to the financial system. Such actions taken by U.S. regulatory agencies include the introduction of programs to restore liquidity to money market mutual funds, the commercial paper market, and other fixed-income securities markets. In addition, the FDIC issued a temporary liquidity guarantee program (the "TLG Program") for the senior debt of all FDIC-insured institutions, as well as deposits in noninterest-bearing transaction deposit accounts.

Despite the difficult operating environment and overall drop in earnings, JPMorgan Chase maintained a strong balance sheet and produced underlying growth in many business areas. The Tier 1 capital ratio was 10.9% at year-end; Treasury & Securities Services and Commercial Banking each reported record revenue and net income for the second straight year; the consumer businesses opened millions of new checking and credit card accounts; Asset Management experienced record net inflows in assets under management; and the Investment Bank gained market share in all major fee categories. The diversified nature of the Firm's businesses and its strong capital position enabled it to weather the recessionary environment during 2008.

JPMorgan Chase has taken a leadership role in helping to stabilize the financial markets. It assumed the risk and expended the necessary resources to acquire Bear Stearns and the banking operations of Washington Mutual. In October 2008, the Firm agreed to accept a $25 billion capital investment by the U.S. Treasury under the Capital Purchase Program. JPMorgan Chase has continued to lend to clients in a safe and sound manner and to provide liquidity to multiple financial markets. The Firm has implemented programs that have prevented more than 300,000 foreclosures, with plans to help more than 400,000 more families keep their homes through Chase-owned mortgage modifications over the next two years. The Firm has expanded this effort to include over $1.1 trillion of investor-owned mortgages.

The discussion that follows highlights the performance of each business segment compared with the prior year, and discusses results on a managed basis unless otherwise noted. For more information about managed basis, see Explanation and reconciliation of the Firm's use of non-GAAP financial measures on pages 50–51 of this Annual Report.

Investment Bank reported a net loss for the year, compared with net income in 2007. The significant decline in results reflected lower total net revenue, a higher provision for credit losses and higher total noninterest expense. Markdowns of over $10 billion on mortgage-related positions and leveraged lending funded and unfunded commitments drove fixed income trading revenue lower; investment banking fees and equity trading revenue declined as well. These decreases were offset by record performance in rates and currencies, credit trading, commodities and emerging markets, as well as strong equity client revenue, and gains from the widening of the Firm's credit spread on certain structured liabilities and derivatives. The provision for credit losses rose from the 2007 level, predominantly reflecting a higher allowance for credit losses, driven by a weakening credit environment, as well as the effect of the transfer of $4.9 billion of funded and unfunded leveraged lending commitments to retained loans from held-for-sale in the first quarter of 2008. The increase in total noninterest expense was largely driven by additional expense relating to the Bear Stearns merger, offset partially by lower performance-based compensation expense. In addition, IB benefited from a reduction in deferred tax liabilities on overseas earnings.

Retail Financial Services net income declined, reflecting a significant increase in the provision for credit losses, predominantly offset by positive mortgage servicing rights ("MSR") risk management results and the positive impact of the Washington Mutual transaction. Additional drivers of revenue growth included wider loan and deposit spreads and higher loan and deposit balances. The provision for credit losses increased as housing price declines have continued to result in significant increases in estimated losses, particularly for high loan-to-value home equity and mortgage loans. The provision was also affected by an increase in estimated losses for the auto, student and business banking loan portfolios. Total noninterest expense rose from the 2007 level, reflecting the impact of the Washington Mutual transaction, higher mortgage reinsurance losses, increased mortgage servicing expense and investments in the retail distribution network.

Card Services net income declined, driven by a higher provision for credit losses partially offset by higher managed total net revenue. The growth in managed total net revenue was driven by the impact of the Washington Mutual transaction, higher average managed loan balances, wider loan spreads and increased interchange income, offset predominantly by increased rewards expense and higher volume-driven payments to partners, as well as the effect of higher revenue reversals associated with higher charge-offs. The managed provision for credit losses increased from the prior year due to an increase in the allowance for loan losses and a higher level of charge-offs. Total noninterest expense rose from last year, largely due to the impact of the Washington Mutual transaction.

Commercial Banking net income increased, surpassing the record level posted in 2007. The results were driven by record total net revenue, partially offset by an increase in the provision for credit losses. The increase in revenue was driven by double-digit growth in liability and loan balances, the impact of the Washington Mutual transaction, higher deposit and lending-related fees, and increases in other fee

income. These were partially offset by spread compression in the liability and loan portfolios. The increase in the provision for credit losses reflected a weakening credit environment and growth in loan balances. Total noninterest expense decreased from the prior year, due to lower performance-based incentive compensation and volume-based charges from service providers, predominantly offset by the impact of the Washington Mutual transaction.

Treasury & Securities Services net income increased over the record level set in 2007, driven by record total net revenue, partially offset by higher noninterest expense. Worldwide Securities Services posted record net revenue, driven by wider spreads in securities lending, foreign exchange and liability products, increased product usage by new and existing clients, and higher liability balances. These benefits were partially offset by market depreciation. Treasury Services posted record net revenue, reflecting higher liability balances and volume growth in electronic funds transfer products and trade loans. Total noninterest expense increased, reflecting higher expense related to business and volume growth, as well as continued investment in new product platforms.

Asset Management net income decreased, driven by lower total net revenue, offset partially by lower total noninterest expense. The decline in revenue was due to lower performance fees and the effect of lower markets, including the impact of lower market valuations of seed capital investments. Partially offsetting these revenue declines were higher deposit and loan balances, the benefit of the Bear Stearns merger, increased revenue from net asset inflows and wider deposit spreads. The provision for credit losses rose from the prior year, reflecting an increase in loan balances, higher net charge-offs and a weakening credit environment. Total noninterest expense declined compared with 2007, driven by lower performance-based compensation, largely offset by the effect of the Bear Stearns merger and higher compensation expense resulting from increased average headcount.

Corporate/Private Equity net income declined from the 2007 level and included an extraordinary gain related to the Washington Mutual transaction and a conforming loan loss provision. Excluding these items, the decrease in net income from the prior year was driven by private equity losses in 2008, compared with gains in 2007, losses on preferred securities of Fannie Mae and Freddie Mac, and a charge related to the offer to repurchase auction-rate securities. These declines were partially offset by the proceeds from the sale of Visa shares in its initial public offering and a gain on the dissolution of the Chase Paymentech Solutions joint venture and the gain from the sale of MasterCard shares. The decrease in total noninterest expense reflected a reduction of credit card-related litigation expense, partially offset by higher merger costs.

The Firm's managed provision for credit losses was $24.6 billion for 2008, compared with $9.2 billion for 2007. The total consumer-managed provision for credit losses was $21.3 billion, compared with $8.3 billion in the prior year, reflecting increases in the allowance for credit losses related to home equity, mortgage and credit card loans, as well as higher net charge-offs. Consumer-managed net charge-offs were $13.0 billion, compared with $6.8 billion in the prior year, resulting in managed net charge-off rates of 3.06% and 1.97%, respectively. The wholesale provision for credit losses was $3.3 billion, compared with $934 million in the prior year, due to an increase in the allowance for credit losses reflecting the effect of a weakening credit environment and loan growth. Wholesale net charge-offs were $402 million, compared with net charge-offs of $72 million in the prior year, resulting in net charge-off rates of 0.18% and 0.04%, respectively. The Firm had total nonperforming assets of $12.7 billion at December 31, 2008, up from the prior-year level of $3.9 billion.

Total stockholders' equity at December 31, 2008, was $166.9 billion, and the Tier 1 capital ratio was 10.9%. During 2008, the Firm raised $11.5 billion of common equity and $32.8 billion of preferred equity, including a warrant issued to the U.S. Treasury.

2009 Business outlook

The following forward-looking statements are based upon the current beliefs and expectations of JPMorgan Chase's management and are subject to significant risks and uncertainties. These risks and uncertainties could cause JPMorgan Chase's actual results to differ materially from those set forth in such forward-looking statements.

JPMorgan Chase's outlook for 2009 should be viewed against the backdrop of the global and U.S. economies, financial markets activity, the geopolitical environment, the competitive environment and client activity levels. Each of these linked factors will affect the performance of the Firm and its lines of business. In addition, as a result of recent market conditions and events, Congress and regulators have increased their focus on the regulation of financial institutions. The Firm's current expectations are for the global and U.S. economic environments to weaken further and potentially faster, capital markets to remain under stress, for there to be continued decline in U.S. housing prices, and for Congress and regulators to continue to adopt legislation and regulations that could limit or restrict the Firm's operations, or impose additional costs upon the Firm in order to comply with such new laws or rules. These factors are likely to continue to adversely impact the Firm's revenue, credit costs, overall business volumes and earnings.

Given the potential stress on the consumer from rising unemployment, the continued downward pressure on housing prices and the elevated national inventory of unsold homes, management remains extremely cautious with respect to the credit outlook for home equity, mortgage and credit card portfolios. Management expects continued deterioration in credit trends for the home equity, mortgage and credit card portfolios, which will likely require additions to the consumer loan loss allowance in 2009 or beyond. Economic data released in early 2009 indicated that housing prices and the labor market have weakened further since year-end, and that deterioration could continue into late 2009. Based on management's current economic outlook, quarterly net charge-offs could, over the next several quarters, reach $1.0 billion to $1.4 billion for the home equity portfolio, $375 million to $475 million for the prime mortgage portfolio, and $375 million to $475 million for the subprime mortgage portfolio. Management expects the managed net charge-off rate for Card Services (excluding the impact resulting from the acquisition of Washington Mutual's banking operations) to approach 7% in the first quarter of 2009 and likely higher by the end of the year depending on unemployment levels. These charge-off rates could increase even further if the economic environment continues to deteriorate

further than management's current expectations. The wholesale provision for credit losses and nonperforming assets are likely to increase over time as a result of the deterioration in underlying credit conditions. Wholesale net charge-offs in 2008 increased from historic lows in 2007 and are likely to increase materially in 2009 as a result of increasing weakness in the credit environment.

The Investment Bank continues to be negatively affected by the disruption in the credit and mortgage markets, as well as by overall lower levels of liquidity. The continuation of these factors could potentially lead to reduced levels of client activity, lower investment banking fees and lower trading revenue. In addition, if the Firm's own credit spreads tighten, as they did in the fourth quarter of 2008, the change in the fair value of certain trading liabilities would also negatively affect trading results. The Firm held $12.6 billion (gross notional) of legacy leveraged loans and unfunded commitments as held-for-sale as of December 31, 2008. Markdowns averaging 45% of the gross notional value have been taken on these legacy positions as of December 31, 2008, resulting in a net carrying value of $6.9 billion. Leveraged loans and unfunded commitments are difficult to hedge effectively, and if market conditions further deteriorate, additional markdowns may be necessary on this asset class. The Investment Bank also held, at December 31, 2008, an aggregate $6.1 billion of prime and Alt-A mortgage exposure, which is also difficult to hedge effectively, and $875 million of subprime mortgage exposure. In addition, the Investment Bank had $7.7 billion of commercial mortgage exposure. In spite of active hedging, mortgage exposures could be adversely affected by worsening market conditions and further deterioration in the housing market. The combination of credit costs and additional markdowns on the various exposures noted above could reach or exceed $2.0 billion for the first quarter of 2009.

Earnings in Commercial Banking and Treasury & Securities Services could decline due to the impact of tighter spreads in the low interest rate environment or a decline in the level of liability balances. Earnings in Treasury & Securities Services and Asset Management will likely deteriorate if market levels continue to decline, due to reduced levels of assets under management, supervision and custody. Earnings in the Corporate/Private Equity segment could be more volatile due to increases in the size of the Firm's investment portfolio, which is largely comprised of investment-grade securities. Private Equity results are dependent upon the capital markets and at current market levels, management believes additional write-downs of $400 million or more are likely in the first quarter of 2009.

Assuming economic conditions do not worsen beyond management's current expectations, management continues to believe that the net income impact of the acquisition of Washington Mutual's banking operations could be approximately $0.50 per share in 2009; the Bear Stearns merger could contribute $1 billion (after-tax) annualized after 2009; and merger-related items, which include both the Washington Mutual transaction and the Bear Stearns merger, could be approximately $600 million (after-tax) in 2009.

Recent developments

On February 23, 2009, the Board of Directors reduced the Firm's quarterly common stock dividend from $0.38 to $0.05 per share, effective for the dividend payable April 30, 2009, to shareholders of record on April 6, 2009. The action taken will enable the Firm to retain an additional $5.0 billion in common equity per year. The Firm expects to maintain the dividend at this level for the time being. The action was taken in order to help ensure that the Firm's balance sheet retained the capital strength necessary to weather a further decline in economic conditions. The Firm intends to return to a more normalized dividend payout ratio as soon as feasible after the environment has stabilized.

CONSOLIDATED RESULTS OF OPERATIONS

The following section provides a comparative discussion of JPMorgan Chase's Consolidated Results of Operations on a reported basis for the three-year period ended December 31, 2008. Factors that related primarily to a single business segment are discussed in more detail within that business segment. For a discussion of the Critical Accounting Estimates Used by the Firm that affect the Consolidated Results of Operations, see pages 119–123 of this Annual Report.

Revenue

Year ended December 31, (in millions)	**2008**[a]	2007	2006
Investment banking fees	**$ 5,526**	$ 6,635	$ 5,520
Principal transactions	**(10,699)**	9,015	10,778
Lending & deposit-related fees	**5,088**	3,938	3,468
Asset management, administration and commissions	**13,943**	14,356	11,855
Securities gains (losses)	**1,560**	164	(543)
Mortgage fees and related income	**3,467**	2,118	591
Credit card income	**7,419**	6,911	6,913
Other income	**2,169**	1,829	2,175
Noninterest revenue	**28,473**	44,966	40,757
Net interest income	**38,779**	26,406	21,242
Total net revenue	**$67,252**	$ 71,372	$ 61,999

(a) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the Bear Stearns merger was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.

2008 compared with 2007

Total net revenue of $67.3 billion was down $4.1 billion, or 6%, from the prior year. The decline resulted from the extremely challenging business environment for financial services firms in 2008. Principal transactions revenue decreased significantly and included net markdowns on mortgage-related positions and leveraged lending funded and unfunded commitments, losses on preferred securities of Fannie Mae and Freddie Mac, and losses on private equity investments. Also contributing to the decline in total net revenue were other losses and markdowns recorded in other income, including the Firm's share of Bear Stearns' losses from April 8 to May 30, 2008. These declines were largely offset by higher net interest income, proceeds from the sale of Visa shares in its initial public offering, and the gain on the dissolution of the Chase Paymentech Solutions joint venture.

Investment banking fees were down from the record level of the prior year due to lower debt underwriting fees, as well as lower advisory and equity underwriting fees, both of which were at record levels in 2007. These declines were attributable to reduced market activity. For a further discussion of investment banking fees, which are primarily recorded in IB, see IB segment results on pages 54–56 of this Annual Report.

In 2008, principal transactions revenue, which consists of revenue from the Firm's trading and private equity investing activities, declined by $19.7 billion from the prior year. Trading revenue decreased $14.5 billion to a negative $9.8 billion compared with a positive $4.7 billion in 2007. The decline in trading revenue was largely driven by higher net markdowns of $5.9 billion on mortgage-related exposures compared with $1.4 billion in the prior year; higher net markdowns of $4.7 billion on leveraged lending funded and unfunded commitments compared with $1.3 billion in the prior year; losses of $1.1 billion on preferred securities of Fannie Mae and Freddie Mac; and weaker equity trading results compared with a record level in 2007. In addition, trading revenue was adversely impacted by the Bear Stearns merger. Partially offsetting the decline in trading revenue were record results in rates and currencies, credit trading, commodities and emerging markets, as well as strong equity client revenue across products and total gains of $2.0 billion from the widening of the Firm's credit spread on certain structured liabilities and derivatives, compared with $1.3 billion in 2007. Private equity results also declined substantially from the prior year, swinging to losses of $908 million in 2008 from gains of $4.3 billion in 2007. In addition, the first quarter of 2007 included a fair value adjustment related to the adoption of SFAS 157. For a further discussion of principal transactions revenue, see IB and Corporate/Private Equity segment results on pages 54–56 and 73–75, respectively, and Note 6 on pages 158–160 of this Annual Report.

Lending & deposit-related fees rose from the prior year, predominantly resulting from higher deposit-related fees and the impact of the Washington Mutual transaction. For a further discussion of lending & deposit-related fees, which are mostly recorded in RFS, TSS and CB, see the RFS segment results on pages 57–62, the TSS segment results on pages 68–69, and the CB segment results on pages 66–67 of this Annual Report.

The decline in asset management, administration and commissions revenue compared with 2007 was driven by lower asset management fees in AM due to lower performance fees and the effect of lower markets on assets under management. This decline was partially offset by an increase in commissions revenue related predominantly to higher brokerage transaction volume within IB's equity markets revenue, which included additions from Bear Stearns' Prime Services business; and higher administration fees in TSS driven by wider spreads in securities lending and increased product usage by new and existing clients. For additional information on these fees and commissions, see the segment discussions for IB on pages 54–56, RFS on pages 57–62, TSS on pages 68–69, and AM on pages 70–72 of this Annual Report.

The increase in securities gains compared with the prior year was due to the repositioning of the Corporate investment securities portfolio as a result of lower interest rates as part of managing the structural interest rate risk of the Firm, and higher gains from the sale of MasterCard shares. For a further discussion of securities gains, which are mostly recorded in the Firm's Corporate business, see the Corporate/Private Equity segment discussion on pages 73–75 of this Annual Report.

Mortgage fees and related income increased from the prior year, driven by higher net mortgage servicing revenue, which benefited from an improvement in MSR risk management results and increased loan servicing revenue. Mortgage production revenue increased slightly, as the impact of growth in originations was predominantly

offset by markdowns on the mortgage warehouse and increased reserves related to the repurchase of previously sold loans. For a discussion of mortgage fees and related income, which is recorded primarily in RFS's Consumer Lending business, see the Consumer Lending discussion on pages 59–62 of this Annual Report.

Credit card income rose compared with the prior year, driven by increased interchange income due to higher customer charge volume in CS and higher debit card transaction volume in RFS, the impact of the Washington Mutual transaction, and increased servicing fees resulting from a higher level of securitized receivables. These results were partially offset by increases in volume-driven payments to partners and expense related to rewards programs. For a further discussion of credit card income, see CS' segment results on pages 63–65 of this Annual Report.

Other income increased compared with the prior year, due predominantly to the proceeds from the sale of Visa shares in its initial public offering of $1.5 billion, the gain on the dissolution of the Chase Paymentech Solutions joint venture of $1.0 billion, and gains on sales of certain other assets. These proceeds and gains were partially offset by markdowns on certain investments, including seed capital in AM; a $464 million charge related to the offer to repurchase auction-rate securities at par; losses of $423 million reflecting the Firm's 49.4% ownership in Bear Stearns' losses from April 8 to May 30, 2008; and lower securitization income at CS.

Net interest income rose from the prior year, due predominantly to the following: higher trading-related net interest income in IB, the impact of the Washington Mutual transaction, wider net interest spread in Corporate/Private Equity, growth in liability and deposit balances in the wholesale and RFS businesses, higher consumer and wholesale loan balances, and wider spreads on consumer loans in RFS. The Firm's total average interest-earning assets for 2008 were $1.4 trillion, up 23% from the prior year, driven by higher loans, available-for-sale ("AFS") securities, securities borrowed, brokerage receivables and other interest-earning assets balances. The Firm's total average interest-bearing liabilities for 2008 were $1.3 trillion, up 24% from the prior year, driven by higher deposits, long-term debt, brokerage payables and other borrowings balances. The net interest yield on the Firm's interest-earning assets, on a fully taxable equivalent basis, was 2.87%, an increase of 48 basis points from the prior year.

2007 compared with 2006

Total net revenue of $71.4 billion was up $9.4 billion, or 15%, from the prior year. Higher net interest income, very strong private equity gains, record asset management, administration and commissions revenue, higher mortgage fees and related income, and record investment banking fees contributed to the revenue growth. These increases were offset partially by lower trading revenue.

Investment banking fees grew in 2007 to a level higher than the previous record set in 2006. Record advisory and equity underwriting fees drove the results, partially offset by lower debt underwriting fees. For a further discussion of investment banking fees, which are primarily recorded in IB, see IB segment results on pages 54–56 of this Annual Report.

Principal transactions revenue consists of trading revenue and private equity gains. Trading revenue declined significantly from the 2006 level, primarily due to net markdowns in IB of $1.4 billion on subprime positions, including subprime collateralized debt obligations ("CDOs"), and $1.3 billion on leveraged lending funded loans and unfunded commitments. Also in IB, markdowns of securitized products related to nonsubprime mortgages and weak credit trading performance more than offset record revenue in currencies and strong revenue in both rates and equities. Equities benefited from strong client activity and record trading results across all products. IB's Credit Portfolio results increased compared with the prior year, primarily driven by higher revenue from risk management activities. The increase in private equity gains from 2006 reflected a significantly higher level of gains, the classification of certain private equity carried interest as compensation expense and a fair value adjustment in the first quarter of 2007 on nonpublic private equity investments resulting from the adoption of SFAS 157 ("Fair Value Measurements"). For a further discussion of principal transactions revenue, see IB and Corporate/Private Equity segment results on pages 54–56 and 73–75, respectively, and Note 6 on pages 158–160 of this Annual Report.

Lending & deposit-related fees rose from the 2006 level, driven primarily by higher deposit-related fees and the Bank of New York transaction. For a further discussion of lending & deposit-related fees, which are mostly recorded in RFS, TSS and CB, see the RFS segment results on pages 57–62, the TSS segment results on pages 68–69, and the CB segment results on pages 66–67 of this Annual Report.

Asset management, administration and commissions revenue reached a level higher than the previous record set in 2006. Increased assets under management and higher performance and placement fees in AM drove the record results. The 18% growth in assets under management from year-end 2006 came from net asset inflows and market appreciation across all segments: Institutional, Retail, Private Bank and Private Wealth Management. TSS also contributed to the rise in asset management, administration and commissions revenue, driven by increased product usage by new and existing clients and market appreciation on assets under custody. Finally, commissions revenue increased, due mainly to higher brokerage transaction volume (primarily included within Fixed Income and Equity Markets revenue of IB), which more than offset the sale of the insurance business by RFS in the third quarter of 2006 and a charge in the first quarter of 2007 resulting from accelerated surrenders of customer annuities. For additional information on these fees and commissions, see the segment discussions for IB on pages 54–56, RFS on pages 57–62, TSS on pages 68–69, and AM on pages 70–72 of this Annual Report.

The favorable variance resulting from securities gains in 2007 compared with securities losses in 2006 was primarily driven by improvements in the results of repositioning of the Corporate investment securities portfolio. Also contributing to the positive variance was a $234 million gain from the sale of MasterCard shares. For a further discussion of securities gains (losses), which are mostly recorded in the Firm's Corporate business, see the Corporate/Private Equity segment discussion on pages 73–75 of this Annual Report.

Mortgage fees and related income increased from the prior year as MSRs asset valuation adjustments and growth in third-party mortgage loans serviced drove an increase in net mortgage servicing revenue. Production revenue also grew, as an increase in mortgage loan originations and the classification of certain loan origination costs as expense (loan origination costs previously netted against revenue commenced being recorded as an expense in the first quarter of 2007 due to the adoption of SFAS 159) more than offset markdowns on the mortgage warehouse and pipeline. For a discussion of mortgage fees and related income, which is recorded primarily in RFS' Consumer Lending business, see the Consumer Lending discussion on pages 59–62 of this Annual Report.

Credit card income remained relatively unchanged from the 2006 level, as lower servicing fees earned in connection with securitization activities, which were affected unfavorably by higher net credit losses and narrower loan margins, were offset by increases in net interchange income earned on the Firm's credit and debit cards. For further discussion of credit card income, see CS' segment results on pages 63–65 of this Annual Report.

Other income declined compared with the prior year, driven by lower gains from loan sales and workouts, and the absence of a $103 million gain in the second quarter of 2006 related to the sale of MasterCard shares in its initial public offering. (The 2007 gain on the sale of MasterCard shares was recorded in securities gains (losses) as the shares were transferred to the AFS portfolio subsequent to the IPO.) Increased income from automobile operating leases and higher gains on the sale of leveraged leases and student loans partially offset the decline.

Net interest income rose from the prior year, primarily due to the following: higher trading-related net interest income, due to a shift of Interest expense to principal transactions revenue (related to certain IB structured notes to which fair value accounting was elected in connection with the adoption of SFAS 159); growth in liability and deposit balances in the wholesale and consumer businesses; a higher level of credit card loans; the impact of the Bank of New York transaction; and an improvement in Corporate's net interest spread. The Firm's total average interest-earning assets for 2007 were $1.1 trillion, up 12% from the prior year. The increase was primarily driven by higher trading assets – debt instruments, loans, and AFS securities, partially offset by a decline in interests in purchased receivables as a result of the restructuring and deconsolidation during the second quarter of 2006 of certain multi-seller conduits that the Firm administered. The net interest yield on these assets, on a fully taxable equivalent basis, was 2.39%, an increase of 23 basis points from the prior year, due in part to the adoption of SFAS 159.

Provision for credit losses

Year ended December 31, (in millions)	2008[b]	2007	2006
Wholesale:			
Provision for credit losses	**$ 2,681**	$ 934	$ 321
Provision for credit losses – accounting conformity[a]	**646**	—	—
Total wholesale provision for credit losses	**3,327**	934	321
Consumer:			
Provision for credit losses	**16,764**	5,930	2,949
Provision for credit losses – accounting conformity[a]	**888**	—	—
Total consumer provision for credit losses	**17,652**	5,930	2,949
Total provision for credit losses	**$ 20,979**	$ 6,864	$ 3,270

(a) 2008 included adjustments to the provision for credit losses to conform the Washington Mutual loan loss reserve methodologies to the Firm's methodologies in connection with the Washington Mutual transaction.

(b) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the Bear Stearns merger was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.

2008 compared with 2007

The provision for credit losses in 2008 rose by $14.1 billion compared with the prior year due to increases in both the consumer and wholesale provisions. The increase in the consumer provision reflected higher estimated losses for home equity and mortgages resulting from declining housing prices; an increase in estimated losses for the auto, student and business banking loan portfolios; and an increase in the allowance for loan losses and higher charge-offs of credit card loans. The increase in the wholesale provision was driven by a higher allowance resulting from a weakening credit environment and growth in retained loans. The wholesale provision in the first quarter of 2008 also included the effect of the transfer of $4.9 billion of funded and unfunded leveraged lending commitments to retained loans from held-for-sale. In addition, in 2008 both the consumer and wholesale provisions were affected by a $1.5 billion charge to conform assets acquired from Washington Mutual to the Firm's loan loss methodologies. For a more detailed discussion of the loan portfolio and the allowance for loan losses, see the segment discussions for RFS on pages 57–62, CS on pages 63–65, IB on pages 54–56 and CB on pages 66–67, and the Credit Risk Management section on pages 92–111 of this Annual Report.

2007 compared with 2006

The provision for credit losses in 2007 rose $3.6 billion from the prior year due to increases in both the consumer and wholesale provisions. The increase in the consumer provision from the prior year was largely due to an increase in estimated losses related to home equity, credit card and subprime mortgage loans. Credit card net charge-offs in 2006 benefited following the change in bankruptcy legislation in the fourth quarter of 2005. The increase in the wholesale provision from the prior year primarily reflected an increase in the allowance for

credit losses due to portfolio activity, which included the effect of a weakening credit environment and portfolio growth. For a more detailed discussion of the loan portfolio and the allowance for loan losses, see the segment discussions for RFS on pages 57–62, CS on pages 63–65, IB on pages 54–56, CB on pages 66–67 and Credit Risk Management on pages 92–111 of this Annual Report.

Noninterest expense

Year ended December 31, (in millions)	**2008**[(a)]	2007	2006
Compensation expense	**$ 22,746**	$ 22,689	$ 21,191
Noncompensation expense:			
Occupancy expense	**3,038**	2,608	2,335
Technology, communications and equipment expense	**4,315**	3,779	3,653
Professional & outside services	**6,053**	5,140	4,450
Marketing	**1,913**	2,070	2,209
Other expense	**3,740**	3,814	3,272
Amortization of intangibles	**1,263**	1,394	1,428
Total noncompensation expense	**20,322**	18,805	17,347
Merger costs	**432**	209	305
Total noninterest expense	**$ 43,500**	$ 41,703	$ 38,843

(a) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the Bear Stearns merger was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.

2008 compared with 2007

Total noninterest expense for 2008 was $43.5 billion, up $1.8 billion, or 4%, from the prior year. The increase was driven by the additional operating costs related to the Washington Mutual transaction and Bear Stearns merger, and investments in the businesses, partially offset by lower performance-based incentives.

Compensation expense increased slightly from the prior year predominantly driven by investments in the businesses, including headcount additions associated with the Bear Stearns merger and Washington Mutual transaction, largely offset by lower performance-based incentives.

Noncompensation expense increased from the prior year as a result of the Bear Stearns merger and Washington Mutual transaction. Excluding the effect of these transactions, noncompensation expense decreased due to a net reduction in other expense related to litigation; lower credit card and consumer lending marketing expense; and a decrease in the amortization of intangibles as certain purchased credit card relationships were fully amortized in 2007 and the amortization rate for core deposit intangibles declined in accordance with the amortization schedule. These decreases were offset partially by increases in professional & outside services, driven by investments in new product platforms in TSS, business and volume growth in CS credit card processing and IB brokerage, clearing and exchange transaction processing. Also contributing to the increases were an increase in other expense due to higher mortgage reinsurance losses and mortgage servicing expense due to increased delinquencies and defaults in RFS; an increase in technology, communications and equipment expense reflecting higher depreciation expense on owned automobiles subject to operating leases in RFS, and other technology-related investments across the businesses; and, an increase in occupancy expense partly for the expansion of RFS' retail distribution network. For a further discussion of amortization of intangibles, refer to Note 18 on pages 198–201 of this Annual Report.

For information on merger costs, refer to Note 11 on page 170 of this Annual Report.

2007 compared with 2006

Total noninterest expense for 2007 was $41.7 billion, up $2.9 billion, or 7%, from the prior year. The increase was driven by higher compensation expense, as well as investments across the business segments and acquisitions.

The increase in compensation expense from 2006 was primarily the result of investments and acquisitions in the businesses, including additional headcount from the Bank of New York transaction; the classification of certain private equity carried interest from principal transactions revenue; the classification of certain loan origination costs (loan origination costs previously netted against revenue commenced being recorded as an expense in the first quarter of 2007 due to the adoption of SFAS 159); and higher performance-based incentives. Partially offsetting these increases were business divestitures and continuing business efficiencies.

Noncompensation expense increased from 2006 due to higher professional & outside services primarily reflecting higher brokerage expense and credit card processing costs resulting from growth in transaction volume, as well as investments in the businesses and acquisitions. Also contributing to the increase was higher other expense due to increased net legal-related costs, reflecting a lower level of insurance recoveries and increased costs of credit card-related litigation, and other increases driven by business growth and investments in the businesses. Other noncompensation expense increases also included higher occupancy expense driven by ongoing investments in the businesses, in particular, the retail distribution network and the Bank of New York transaction; and higher technology, communications and equipment expense due primarily to higher depreciation expense on owned automobiles subject to operating leases in RFS, and other technology-related investments in the businesses to support business growth. These increases were offset partially by lower credit card marketing expense; decreases due to the sale of the insurance business at the beginning of the third quarter of 2006 and lower credit card fraud-related losses, both in other expense. In addition, expense in general was reduced by the effect of continuing business efficiencies. For a discussion of amortization of intangibles, refer to Note 18 on pages 198–201 of this Annual Report.

For information on merger costs, refer to Note 11 on page 170 of this Annual Report.

Income tax expense

The Firm's income from continuing operations before income tax expense (benefit), income tax expense (benefit) and effective tax rate were as follows for each of the periods indicated.

Year ended December 31, (in millions, except rate)	**2008**[a]	2007	2006
Income from continuing operations before income tax expense (benefit)	**$ 2,773**	$ 22,805	$ 19,886
Income tax expense (benefit)	**(926)**	7,440	6,237
Effective tax rate	**(33.4)%**	32.6%	31.4%

(a) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the Bear Stearns merger was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.

2008 compared with 2007

The decrease in the effective tax rate in 2008 compared with the prior year was the result of significantly lower reported pretax income combined with changes in the proportion of income subject to U.S. federal taxes. Also contributing to the decrease in the effective tax rate was increased business tax credits and the realization of a $1.1 billion benefit from the release of deferred tax liabilities. These deferred tax liabilities were associated with the undistributed earnings of certain non-U.S. subsidiaries that were deemed to be reinvested indefinitely. These decreases were partially offset by changes in state and local taxes, and equity losses representing the Firm's 49.4% ownership interest in Bear Stearns' losses from April 8 to May 30, 2008, for which no income tax benefit was recorded. For a further discussion of income taxes, see Critical Accounting Estimates Used by the Firm on pages 119–123 and Note 28 on pages 209–211 of this Annual Report.

2007 compared with 2006

The increase in the effective tax rate for 2007, as compared with the prior year, was primarily the result of higher reported pretax income combined with changes in the proportion of income subject to federal, state and local taxes. Also contributing to the increase in the effective tax rate was the recognition in 2006 of $367 million of benefits related to the resolution of tax audits.

Income from discontinued operations

As a result of the transaction with The Bank of New York on October 1, 2006, the results of operations of the selected corporate trust businesses (i.e., trustee, paying agent, loan agency and document management services) were reported as discontinued operations.

Income from discontinued operations in 2006 was due predominantly to a gain of $622 million from exiting selected corporate trust businesses in the fourth quarter of 2006. No income from discontinued operations was recorded in 2008 or 2007.

Extraordinary gain

The Firm recorded an extraordinary gain of $1.9 billion in 2008 associated with the acquisition of the banking operations of Washington Mutual. The transaction is being accounted for under the purchase method of accounting in accordance with SFAS 141. The adjusted fair value of net assets of the banking operations, after purchase accounting adjustments, was higher than JPMorgan Chase's purchase price. There were no extraordinary gains recorded in 2007 or 2006.

EXPLANATION AND RECONCILIATION OF THE FIRM'S USE OF NON-GAAP FINANCIAL MEASURES

The Firm prepares its consolidated financial statements using accounting principles generally accepted in the United States of America ("U.S. GAAP"); these financial statements appear on pages 130–133 of this Annual Report. That presentation, which is referred to as "reported basis," provides the reader with an understanding of the Firm's results that can be tracked consistently from year to year and enables a comparison of the Firm's performance with other companies' U.S. GAAP financial statements.

In addition to analyzing the Firm's results on a reported basis, management reviews the Firm's results and the results of the lines of business on a "managed" basis, which is a non-GAAP financial measure. The Firm's definition of managed basis starts with the reported U.S. GAAP results and includes certain reclassifications that assume credit card loans securitized by CS remain on the balance sheet and presents revenue on a fully taxable-equivalent ("FTE") basis. These adjustments do not have any impact on net income as reported by the lines of business or by the Firm as a whole.

The presentation of CS results on a managed basis assumes that credit card loans that have been securitized and sold in accordance with SFAS 140 remain on the Consolidated Balance Sheets and that the earnings on the securitized loans are classified in the same manner as the earnings on retained loans recorded on the Consolidated Balance Sheets. JPMorgan Chase uses the concept of managed basis to evaluate the credit performance and overall financial performance of the entire managed credit card portfolio. Operations are funded and decisions are made about allocating resources, such as employees and capital, based upon managed financial information. In addition, the same underwriting standards and ongoing risk monitoring

The following summary table provides a reconciliation from the Firm's reported U.S. GAAP results to managed basis.
(Table continues on next page)

	2008				2007			
Year ended December 31, (in millions, except per share and ratio data)	Reported results	Credit card[c]	Fully tax-equivalent adjustments	Managed basis	Reported results	Credit card[c]	Fully tax-equivalent adjustments	Managed basis

(a) 2008 included an accounting conformity loan loss reserve provision related to the acquisition of Washington Mutual's banking operations.
(b) Based on income from continuing operations.
(c) Credit card securitizations affect CS. See pages 63–65 of this Annual Report for further information.

are used for both loans on the Consolidated Balance Sheets and securitized loans. Although securitizations result in the sale of credit card receivables to a trust, JPMorgan Chase retains the ongoing customer relationships, as the customers may continue to use their credit cards; accordingly, the customer's credit performance will affect both the securitized loans and the loans retained on the Consolidated Balance Sheets. JPMorgan Chase believes managed basis information is useful to investors, enabling them to understand both the credit risks associated with the loans reported on the Consolidated Balance Sheets and the Firm's retained interests in securitized loans. For a reconciliation of reported to managed basis results for CS, see CS segment results on pages 63–65 of this Annual Report. For information regarding the securitization process, and loans and residual interests sold and securitized, see Note 16 on pages 180–188 of this Annual Report.

Total net revenue for each of the business segments and the Firm is presented on a FTE basis. Accordingly, revenue from tax-exempt securities and investments that receive tax credits is presented in the managed results on a basis comparable to taxable securities and investments. This non-GAAP financial measure allows management to assess the comparability of revenue arising from both taxable and tax-exempt sources. The corresponding income tax impact related to these items is recorded within income tax expense.

Management also uses certain non-GAAP financial measures at the business segment level because it believes these other non-GAAP financial measures provide information to investors about the underlying operational performance and trends of the particular business segment and therefore facilitate a comparison of the business segment with the performance of its competitors.

Calculation of certain U.S. GAAP and non-GAAP metrics

The table below reflects the formulas used to calculate both the following U.S. GAAP and non-GAAP measures:

Return on common equity

Net income* / Average common stockholders' equity

Return on common equity less goodwill[d]

Net income* / Average common stockholders' equity less goodwill

Return on assets

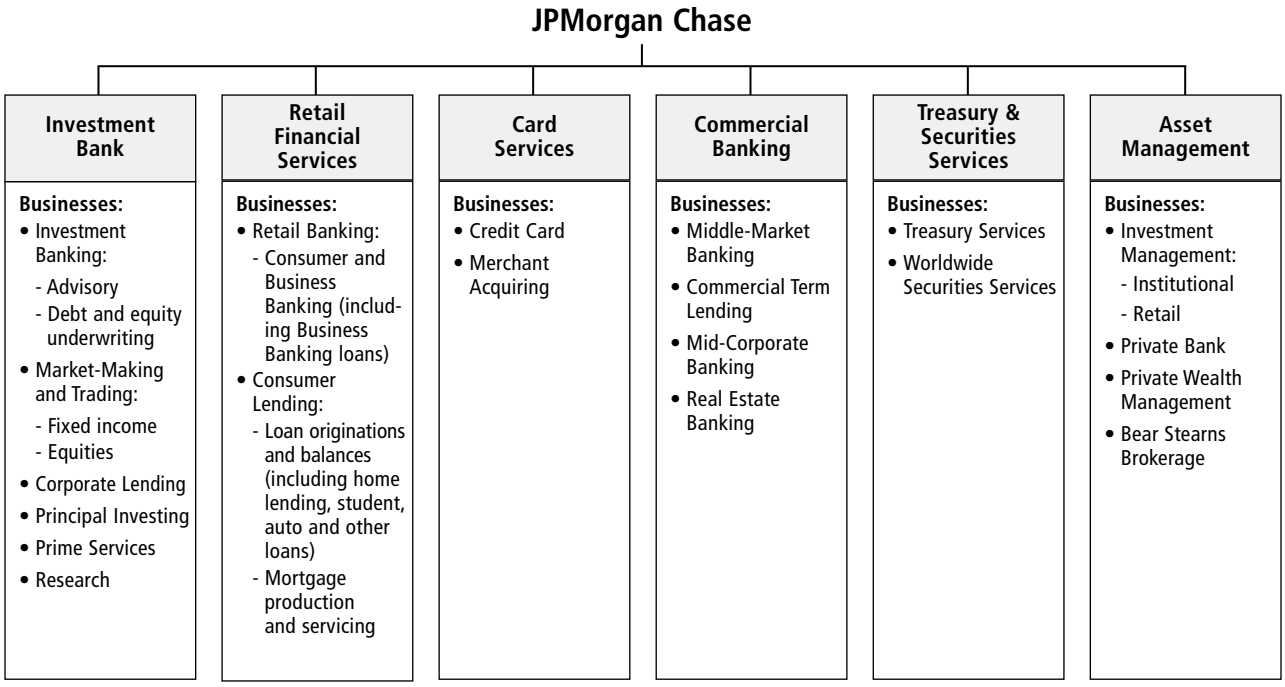
Reported: Net income / Total average assets

Managed: Net income / Total average managed assets[e] (including average securitized credit card receivables)

Overhead ratio

Total noninterest expense / Total net revenue

* Represents net income applicable to common stock



(d) The Firm uses return on common equity less goodwill, a non-GAAP financial measure, to evaluate the operating performance of the Firm and to facilitate comparisons to competitors.

(e) The Firm uses return on managed assets, a non-GAAP financial measure, to evaluate the overall performance of the managed credit card portfolio, including securitized credit card loans.

BUSINESS SEGMENT RESULTS

The Firm is managed on a line-of-business basis. The business segment financial results presented reflect the current organization of JPMorgan Chase. There are six major reportable business segments: the Investment Bank, Retail Financial Services, Card Services, Commercial Banking, Treasury & Securities Services and Asset Management, as well as a Corporate/Private Equity segment.

The business segments are determined based upon the products and services provided, or the type of customer served, and they reflect the manner in which financial information is currently evaluated by management. Results of these lines of business are presented on a managed basis.

Business segment changes

Commencing October 1, 2008, RFS was reorganized into the following two reporting segments: Retail Banking and Consumer Lending. Previously, RFS consisted of three reporting segments: Regional Banking, Mortgage Banking and Auto Finance. The new Retail Banking reporting segment now comprises consumer banking and business banking activities, which previously were reported in Regional Banking. The new Consumer Lending reporting segment now comprises: (a) the prior Mortgage Banking and Auto Finance reporting segments, (b) the home equity, student and other lending business activities which were previously reported in the Regional Banking reporting segment and (c) loan activity related to prime mortgages that were originated by RFS, but reported in the Corporate/Private Equity business segment. This reorganization is reflected in this Annual Report and the financial information for prior periods has been revised to reflect the changes as if they had been in effect throughout all periods reported.

Description of business segment reporting methodology

Results of the business segments are intended to reflect each segment as if it were essentially a stand-alone business. The management reporting process that derives business segment results allocates income and expense using market-based methodologies.

Business segment reporting methodologies used by the Firm are discussed below. The Firm continues to assess the assumptions, methodologies and reporting classifications used for segment reporting, and further refinements may be implemented in future periods.

Revenue sharing

When business segments join efforts to sell products and services to the Firm's clients, the participating business segments agree to share revenue from those transactions. The segment results reflect these revenue-sharing agreements.

Funds transfer pricing

Funds transfer pricing is used to allocate interest income and expense to each business and transfer the primary interest rate risk exposures to the Treasury group within the Corporate/Private Equity business segment. The allocation process is unique to each business segment and considers the interest rate risk, liquidity risk and regulatory requirements of that segment's stand-alone peers. This process is overseen by the Firm's Asset-Liability Committee ("ALCO"). Business segments may retain certain interest rate exposures, subject to management approval, that would be expected in the normal operation of a similar peer business.

Capital allocation

Each business segment is allocated capital by taking into consideration stand-alone peer comparisons, economic risk measures and regulatory capital requirements. The amount of capital assigned to each business is referred to as equity. Line of business equity increased during the second quarter of 2008 in IB and AM due to the Bear Stearns merger and, for AM, the purchase of the additional equity interest in Highbridge. At the end of the third quarter of 2008, equity was increased for each line of business with a view toward the future implementation of the new Basel II capital rules. For further details on these rules, see Basel II on page 84 of this Annual Report. In addition, equity allocated to RFS, CS and CB was increased as a result of the Washington Mutual transaction. For a further discussion, see Capital management–Line of business equity on page 82 of this Annual Report.

Expense allocation

Where business segments use services provided by support units within the Firm, the costs of those support units are allocated to the business segments. The expense is allocated based upon their actual cost or the lower of actual cost or market, as well as upon usage of the services provided. In contrast, certain other expense related to certain corporate functions, or to certain technology and operations, are not allocated to the business segments and are retained in Corporate. Retained expense includes: parent company costs that would not be incurred if the segments were stand-alone businesses; adjustments to align certain corporate staff, technology and operations allocations with market prices; and other one-time items not aligned with the business segments.

Segment results – Managed basis[a][b]

The following table summarizes the business segment results for the periods indicated.

Year ended December 31, (in millions, except ratios)	Total net revenue			Noninterest expense		
	2008	2007	2006	**2008**	2007	2006

(a) Represents reported results on a tax-equivalent basis and excludes the impact of credit card securitizations.
(b) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the Bear Stearns merger was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.
(c) Net income included an extraordinary gain of $1.9 billion related to the Washington Mutual transaction for 2008 and income from discontinued operations of $795 million for 2006.

INVESTMENT BANK

J.P. Morgan is one of the world's leading investment banks, with deep client relationships and broad product capabilities. The Investment Bank's clients are corporations, financial institutions, governments and institutional investors. The Firm offers a full range of investment banking products and services in all major capital markets, including advising on corporate strategy and structure, capital raising in equity and debt markets, sophisticated risk management, market-making in cash securities and derivative instruments, prime brokerage and research. IB also selectively commits the Firm's own capital to principal investing and trading activities.

On May 30, 2008, JPMorgan Chase merged with The Bear Stearns Companies, Inc. The merger provided IB with a leading global prime brokerage business and expanded the existing energy platform. It also strengthened IB's franchise in Equity and Fixed Income Markets, as well as client coverage.

Compensation expense as % of total net revenue	**63**	44	41

(a) The 2008 results include net markdowns on mortgage-related exposures and leveraged lending funded and unfunded commitments of $5.9 billion and $4.7 billion, respectively, compared with $1.4 billion and $1.3 billion, respectively, in 2007.
(b) All other income for 2008 decreased from the prior year due to increased revenue sharing agreements with other business segments. All other income for 2007 decreased from the prior year due mainly to losses on loan sales and lower gains on sales of assets.
(c) Net interest income for 2008 increased from the prior year due to an increase in interest-earning assets, including the addition of the Bear Stearns' Prime Services business combined with wider spreads on certain fixed income products. The increase in 2007 from the prior year was due primarily to an increase in interest-earning assets.
(d) Total net revenue included tax-equivalent adjustments, predominantly due to income tax credits related to affordable housing investments and tax-exempt income from municipal bond investments of $1.7 billion, $927 million and $802 million for 2008, 2007 and 2006, respectively.
(e) TSS is charged a credit reimbursement related to certain exposures managed within IB credit portfolio on behalf of clients shared with TSS.
(f) The income tax benefit in 2008 includes the result of reduced deferred tax liabilities on overseas earnings.
(g) Results for 2008 include seven months of the combined Firm's (JPMorgan Chase's and Bear Stearns') results and five months of heritage JPMorgan Chase results. All prior periods reflect heritage JPMorgan Chase results.

The following table provides IB's total net revenue by business segment.

Year ended December 31, (in millions)	2008[d]	2007	2006
Revenue by business			
Investment banking fees:			
Advisory	**$ 2,008**	$ 2,273	$ 1,659
Equity underwriting	**1,749**	1,713	1,178
Debt underwriting	**2,150**	2,630	2,700
Total investment banking fees	**5,907**	6,616	5,537
Fixed income markets[a]	**1,957**	6,339	8,736
Equity markets[b]	**3,611**	3,903	3,458
Credit portfolio[c]	**739**	1,312	1,102
Total net revenue	**$ 12,214**	$ 18,170	$ 18,833
Revenue by region			
Americas	**$ 2,530**	$ 8,165	$ 9,601
Europe/Middle East/Africa	**7,681**	7,301	7,421
Asia/Pacific	**2,003**	2,704	1,811
Total net revenue	**$ 12,214**	$ 18,170	$ 18,833

(a) Fixed income markets include client and portfolio management revenue related to both market-making and proprietary risk-taking across global fixed income markets, including foreign exchange, interest rate, credit and commodities markets.
(b) Equities markets include client and portfolio management revenue related to market-making and proprietary risk-taking across global equity products, including cash instruments, derivatives and convertibles.
(c) Credit portfolio revenue includes net interest income, fees and the impact of loan sales activity, as well as gains or losses on securities received as part of a loan restructuring, for IB's credit portfolio. Credit portfolio revenue also includes the results of risk management related to the Firm's lending and derivative activities, and changes in the credit valuation adjustment, which is the component of the fair value of a derivative that reflects the credit quality of the counterparty. Additionally, credit portfolio revenue incorporates an adjustment to the valuation of the Firm's derivative liabilities as a result of the adoption of SFAS 157 on January 1, 2007. See pages 92–111 of the Credit Risk Management section of this Annual Report for further discussion.
(d) Results for 2008 include seven months of the combined Firm's (JPMorgan Chase's and Bear Stearns') results and five months of heritage JPMorgan Chase results. All prior periods reflect heritage JPMorgan Chase results.

2008 compared with 2007

Net loss was $1.2 billion, a decrease of $4.3 billion from the prior year, driven by lower total net revenue, a higher provision for credit losses and higher noninterest expense, partially offset by a reduction in deferred tax liabilities on overseas earnings.

Total net revenue was $12.2 billion, down $6.0 billion, or 33%, from the prior year. Investment banking fees were $5.9 billion, down 11% from the prior year, driven by lower debt underwriting and advisory fees reflecting reduced market activity. Debt underwriting fees were $2.2 billion, down 18% from the prior year, driven by lower loan syndication and bond underwriting fees. Advisory fees of $2.0 billion declined 12% from the prior year. Equity underwriting fees were $1.7 billion, up 2% from the prior year driven by improved market share. Fixed Income Markets revenue was $2.0 billion, compared with $6.3 billion in the prior year. The decrease was driven by $5.9

billion of net markdowns on mortgage-related exposures and $4.7 billion of net markdowns on leveraged lending funded and unfunded commitments. Revenue was also adversely impacted by additional losses and cost to risk reduce related to Bear Stearns' positions. These results were offset by record performance in rates and currencies, credit trading, commodities and emerging markets as well as $814 million of gains from the widening of the Firm's credit spread on certain structured liabilities and derivatives. Equity Markets revenue was $3.6 billion, down 7% from the prior year, reflecting weak trading results, partially offset by strong client revenue across products including prime services, as well as $510 million of gains from the widening of the Firm's credit spread on certain structured liabilities and derivatives. Credit portfolio revenue was $739 million, down 44%, driven by losses from widening counterparty credit spreads.

The provision for credit losses was $2.0 billion, an increase of $1.4 billion from the prior year, predominantly reflecting a higher allowance for credit losses, driven by a weakening credit environment, as well as the effect of the transfer of $4.9 billion of funded and unfunded leveraged lending commitments to retained loans from held-for-sale in the first quarter of 2008. Net charge-offs for the year were $105 million, compared with $36 million in the prior year. Total nonperforming assets were $2.5 billion, an increase of $2.0 billion compared with the prior year, reflecting a weakening credit environment. The allowance for loan losses to average loans was 4.71% for 2008, compared with a ratio of 2.14% in the prior year.

Noninterest expense was $13.8 billion, up $770 million, or 6%, from the prior year, reflecting higher noncompensation expense driven primarily by additional expense relating to the Bear Stearns merger, offset partially by lower performance-based compensation expense.

Return on equity was a negative 5% on $26.1 billion of average allocated capital, compared with 15% on $21.0 billion in the prior year.

2007 compared with 2006

Net income was $3.1 billion, a decrease of $535 million, or 15%, from the prior year. The decrease reflected lower fixed income revenue, a higher provision for credit losses and increased noninterest expense, partially offset by record investment banking fees and equity markets revenue.

Total net revenue was $18.2 billion, down $663 million, or 4%, from the prior year. Investment banking fees were $6.6 billion, up 19% from the prior year, driven by record fees across advisory and equity underwriting, partially offset by lower debt underwriting fees. Advisory fees were $2.3 billion, up 37%, and equity underwriting fees were $1.7 billion, up 45%; both were driven by record performance across all regions. Debt underwriting fees of $2.6 billion declined 3%, reflecting lower loan syndication and bond underwriting fees, which were negatively affected by market conditions in the second half of the year. Fixed Income Markets revenue decreased 27% from the prior year. The decrease was due to net markdowns of $1.4 billion on subprime positions, including subprime CDOs and net markdowns of $1.3 billion on leveraged lending funded loans and unfunded commitments. Fixed Income Markets revenue also decreased due to markdowns in securitized products on nonsubprime mortgages and weak credit trading performance. These lower results were offset partially by record revenue in currencies and strong revenue in rates. Equity Markets revenue was $3.9 billion, up 13%, benefiting from strong client activity and record trading results across all products. Credit Portfolio revenue was $1.3 billion, up 19%, primarily due to higher revenue from risk management activities, partially offset by lower gains from loan sales and workouts.

The provision for credit losses was $654 million, an increase of $463 million from the prior year. The change was due to a net increase of $532 million in the allowance for credit losses, primarily due to portfolio activity, which included the effect of a weakening credit environment, and an increase in allowance for unfunded leveraged lending commitments, as well as portfolio growth. In addition, there were $36 million of net charge-offs in 2007, compared with $31 million of net recoveries in the prior year. The allowance for loan losses to average loans was 2.14% for 2007, compared with a ratio of 1.79% in the prior year.

Noninterest expense was $13.1 billion, up $214 million, or 2%, from the prior year.

Return on equity was 15% on $21.0 billion of allocated capital compared with 18% on $20.8 billion in 2006.

Selected metrics

Year ended December 31, (in millions, except headcount)	2008	2007	2006
Selected balance sheet data (period-end)			
Equity	**$ 33,000**	$ 21,000	$ 21,000
Selected balance sheet data (average)			
Total assets	**$832,729**	$ 700,565	$ 647,569
Trading assets–debt and equity instruments[a]	**350,812**	359,775	275,077

Loans:			
Loans retained[b]	**73,108**	62,247	58,846
Loans held-for-sale and loans at fair value[a]	**18,502**	17,723	21,745
Total loans	**91,610**	79,970	80,591
Adjusted assets[c]	**679,780**	611,749	527,753
Equity	**26,098**	21,000	20,753
Headcount	**27,938**	25,543	23,729

(a) As a result of the adoption of SFAS 159 in the first quarter of 2007, $11.7 billion of loans were reclassified to trading assets. Loans held-for-sale and loans at fair value were excluded when calculating the allowance coverage ratio and net charge-off (recovery) rate.

(b) Loans retained included credit portfolio loans, leveraged leases and other accrual loans, and excluded loans at fair value.

(c) Adjusted assets, a non-GAAP financial measure, equals total assets minus (1) securities purchased under resale agreements and securities borrowed less securities sold, not yet purchased; (2) assets of variable interest entities ("VIEs") consolidated under FIN 46R; (3) cash and securities segregated and on deposit for regulatory and other purposes; (4) goodwill and intangibles; (5) securities received as collateral; and (6) investments purchased under the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility. The amount of adjusted assets is presented to assist the reader in comparing IB's asset and capital levels to other investment banks in the securities industry. Asset-to-equity leverage ratios are commonly used as one measure to assess a company's capital adequacy. IB believes an adjusted asset amount that excludes the assets discussed above, which were considered to have a low risk profile, provides a more meaningful measure of balance sheet leverage in the securities industry.

(a) Nonperforming loans included loans held-for-sale and loans at fair value of $32 million, $50 million and $3 million at December 31, 2008, 2007 and 2006, respectively, which were excluded from the allowance coverage ratios. Nonperforming loans at December 31, 2006, excluded distressed loans held-for-sale that were purchased as part of IB's proprietary activities. As a result of the adoption of SFAS 159 in the first quarter of 2007, these loans were reclassified to trading assets.

(b) As a result of the adoption of SFAS 159 in the first quarter of 2007, $11.7 billion of loans were reclassified to trading assets.

(c) Loans held-for-sale and loans at fair value were excluded when calculating the allowance coverage ratio and net charge-off (recovery) rate.

(d) Results for 2008 include seven months of the combined Firm's (JPMorgan Chase's and Bear Stearns') results and five months of heritage JPMorgan Chase results. All prior periods reflect heritage JPMorgan Chase results. For a more complete description of value-at-risk ("VaR"), see pages 112–115 of this Annual Report.

(e) Average VaRs were less than the sum of the VaRs of their market risk components, which was due to risk offsets resulting from portfolio diversification. The diversification effect reflected the fact that the risks were not perfectly correlated. The risk of a portfolio of positions is usually less than the sum of the risks of the positions themselves.

(f) Trading VaR includes predominantly all trading activities in IB; however, particular risk parameters of certain products are not fully captured, for example, correlation risk. Trading VaR does not include VaR related to held-for-sale funded loans and unfunded commitments, nor the debit valuation adjustments ("DVA") taken on derivative and structured liabilities to reflect the credit quality of the Firm. See the DVA Sensitivity table on page 115 of this Annual Report for further details. Trading VaR also does not include the MSR portfolio or VaR related to other corporate functions, such as Corporate/Private Equity. Beginning in the fourth quarter of 2008, trading VaR includes the estimated credit spread sensitivity of certain mortgage products.

(g) Included VaR on derivative credit valuation adjustments ("CVA"), hedges of the CVA and mark-to-market hedges of the retained loan portfolio, which were all reported in principal transactions revenue. This VaR does not include the retained loan portfolio.

(h) Excluding the impact of a loan originated in March 2008 to Bear Stearns, the adjusted ratio would be 4.84% for 2008. The average balance of the loan extended to Bear Stearns was $1.9 billion for 2008. The allowance for loan losses to period-end loans was 4.83% and 1.92% at December 31, 2008 and 2007, respectively.

(a) Source: Thomson Reuters. The results for 2008 are pro forma for the Bear Stearns merger. The results for 2007 and 2006 represent heritage JPMorgan Chase only.

(b) Includes asset-backed securities, mortgage-backed securities and municipal securities.

(c) Includes rights offerings; U.S. domiciled equity and equity-related transactions.

(d) Global announced M&A is based upon rank value; all other rankings are based upon proceeds, with full credit to each book manager/equal if joint. Because of joint assignments, market share of all participants will add up to more than 100%. Global and U.S. announced M&A market share and rankings for 2007 and 2006 include transactions withdrawn since December 31, 2007 and 2006. U.S. announced M&A represents any U.S. involvement ranking.

According to Thomson Reuters, in 2008, the Firm improved its positions to #1 in Global Debt, Equity and Equity-related transactions and Global Equity and Equity-related transactions; and improved its position to #2 in Global Long-term Debt and Global Announced M&A. The Firm maintained its #1 position in Global Syndicated Loans.

According to Dealogic, the Firm was ranked #1 in Investment Banking fees generated during 2008, based upon revenue.

Retail Financial Services, which includes the Retail Banking and Consumer Lending reporting segments, serves consumers and businesses through multiple channels. Customers can use more than 5,400 bank branches (third-largest nationally), 14,500 ATMs (second-largest nationally) as well as online and mobile banking. More than 21,400 branch salespeople assist customers with checking and savings accounts, mortgages, home equity and business loans, and investments across the 23-state footprint from New York and Florida to California. Consumers also can obtain loans through more than 16,000 auto dealerships and 4,800 schools and universities nationwide.

On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual from the FDIC for $1.9 billion through a purchase of substantially all of the assets and assumption of specified liabilities of Washington Mutual. Washington Mutual's banking operations consisted of a retail bank network of 2,244 branches, a nationwide credit card lending business, a multi-family and commercial real estate lending business, and nationwide mortgage banking activities. The transaction expanded the Firm's U.S. consumer branch network in California, Florida, Washington, Georgia, Idaho, Nevada and Oregon and created the nation's third-largest branch network.

During the first quarter of 2006, RFS completed the purchase of Collegiate Funding Services, which contributed a student loan servicing capability and provided an entry into the Federal Family Education Loan Program consolidation market. On July 1, 2006, RFS sold its life insurance and annuity underwriting businesses to Protective Life Corporation. On October 1, 2006, JPMorgan Chase completed the Bank of New York transaction, significantly strengthening RFS' distribution network in the New York tri-state area.

Financial ratios			
ROE	**5%**	18%	22%
Overhead ratio	**51**	57	60
Overhead ratio excluding core deposit intangibles[b]	**50**	55	57

(a) The Firm adopted SFAS 159 in the first quarter of 2007. As a result, beginning in the first quarter of 2007, certain loan-origination costs have been classified as expense.

(b) Retail Financial Services uses the overhead ratio (excluding the amortization of core deposit intangibles ("CDI")), a non-GAAP financial measure, to evaluate the underlying expense trends of the business. Including CDI amortization expense in the overhead ratio calculation results in a higher overhead ratio in the earlier years and a lower overhead ratio in later years; this method would result in an improving overhead ratio over time, all things remaining equal. This non-GAAP ratio excludes Retail Banking's core deposit intangible amortization expense related to the Bank of New York transaction and the Bank One merger of $394 million, $460 million and $458 million for the years ended December 31, 2008, 2007 and 2006, respectively.

2008 compared with 2007

Net income was $880 million, a decrease of $2.0 billion, or 70%, from the prior year, as a significant increase in the provision for credit losses was partially offset by positive MSR risk management results and the positive impact of the Washington Mutual transaction.

Total net revenue was $23.5 billion, an increase of $6.2 billion, or 36%, from the prior year. Net interest income was $14.2 billion, up $3.6 billion, or 35%, benefiting from the Washington Mutual transaction, wider loan and deposit spreads, and higher loan and deposit balances. Noninterest revenue was $9.4 billion, up $2.6 billion, or 38%, as positive MSR risk management results, the impact of the Washington Mutual transaction, higher mortgage origination volume and higher deposit-related fees were partially offset by an increase in reserves related to the repurchase of previously sold loans and markdowns on the mortgage warehouse.

The provision for credit losses was $9.9 billion, an increase of $7.3 billion from the prior year. Delinquency rates have increased due to overall weak economic conditions, while housing price declines have continued to drive increased loss severities, particularly for high loan-to-value home equity and mortgage loans. The provision includes $4.7 billion in additions to the allowance for loan losses for the heritage Chase home equity and mortgage portfolios. Home equity net charge-offs were $2.4 billion (2.23% net charge-off rate; 2.39% excluding purchased credit-impaired loans), compared with $564 million (0.62% net charge-off rate) in the prior year. Subprime mortgage net charge-offs were $933 million (5.49% net charge-off rate; 6.10% excluding purchased credit-impaired loans), compared with $157 million (1.55% net charge-off rate) in the prior year. Prime mortgage net charge-offs were $526 million (1.05% net charge-off rate; 1.18% excluding purchased credit-impaired loans), compared with $33 million (0.13% net charge-off rate) in the prior year. The provision for credit losses was also affected by an increase in estimated losses for the auto, student and business banking loan portfolios.

Total noninterest expense was $12.1 billion, an increase of $2.2 billion, or 22%, from the prior year, reflecting the impact of the Washington Mutual transaction, higher mortgage reinsurance losses, higher mortgage servicing expense and investments in the retail distribution network.

2007 compared with 2006

Net income was $2.9 billion, a decrease of $288 million, or 9%, from the prior year, as a decline in Consumer Lending was offset partially by improved results in Retail Banking.

Total net revenue was $17.3 billion, an increase of $2.5 billion, or 17%, from the prior year. Net interest income was $10.5 billion, up $361 million, or 4%, due to the Bank of New York transaction, wider loan spreads and higher deposit balances. These benefits were offset partially by the sale of the insurance business and a shift to narrower–spread deposit products. Noninterest revenue was $6.8 billion, up $2.1 billion, benefiting from positive MSR risk management results; an increase in deposit-related fees; and the absence of a prior-year $233 million loss related to $13.3 billion of mortgage loans transferred to held-for-sale. Noninterest revenue also benefited from the classification of certain mortgage loan origination costs as expense (loan origination costs previously netted against revenue commenced being recorded as an expense in the first quarter of 2007 due to the adoption of SFAS 159).

The provision for credit losses was $2.6 billion, compared with $561 million in the prior year. The current year provision includes a net increase of $1.0 billion in the allowance for loan losses related to home equity loans as continued weak housing prices have resulted in an increase in estimated losses for high loan-to-value loans. Home equity net charge-offs were $564 million (0.62% net charge-off rate), compared with $143 million (0.18% net charge-off rate) in the prior year. In addition, the current-year provision includes a $166 million increase in the allowance for loan losses related to subprime mortgage loans, reflecting an increase in estimated losses and growth in the portfolio. Subprime mortgage net charge-offs were $157 million (1.55% net charge-off rate), compared with $47 million (0.34% net charge-off rate) in the prior year.

Total noninterest expense was $9.9 billion, an increase of $978 million, or 11%, from the prior year due to the Bank of New York transaction; the classification of certain loan origination costs as expense due to the adoption of SFAS 159; investments in the retail distribution network; and higher mortgage production and servicing expense. These increases were offset partially by the sale of the insurance business.

(a) Loans included prime mortgage loans originated with the intent to sell, which, for new originations on or after January 1, 2007, were accounted for at fair value under SFAS 159. These loans, classified as trading assets on the Consolidated Balance Sheets, totaled $8.0 billion and $12.6 billion at December 31, 2008 and 2007, respectively. Average loans included prime mortgage loans, classified as trading assets on the Consolidated Balance Sheets, of $14.2 billion and $11.9 billion for the years ended December 31, 2008 and 2007, respectively.

(b) Excludes purchased credit-impaired loans accounted for under SOP 03-3 that were acquired as part of the Washington Mutual transaction. These loans were accounted for on a pool basis and the pools are considered to be performing under SOP 03-3.

(c) Nonperforming loans and assets included loans held-for-sale and loans accounted for at fair value of $236 million, $69 million and $116 million at December 31, 2008, 2007 and 2006, respectively. Certain of these loans are classified as trading assets on the Consolidated Balance Sheets.

(d) Nonperforming loans and assets excluded (1) loans eligible for repurchase as well as loans repurchased from Government National Mortgage Association ("GNMA") pools that are insured by U.S. government agencies of $3.3 billion, $1.5 billion and $1.2 billion at December 31, 2008, 2007 and 2006, respectively, and (2) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program of $437 million, $417 million and $387 million at December 31, 2008, 2007 and 2006, respectively. These amounts were excluded, as reimbursement is proceeding normally.

(e) During the second quarter of 2008, the policy for classifying subprime mortgage and home equity loans as nonperforming was changed to conform to all other home lending products. Amounts for 2007 have been revised to reflect this change. Amounts for 2006 have not been revised as the impact was not material.
(f) Loans held-for-sale and loans accounted for at fair value were excluded when calculating the allowance coverage ratio and the net charge-off rate.
(g) Excludes the impact of purchased credit-impaired loans accounted for under SOP 03-3 that were acquired as part of the Washington Mutual transaction at December 31, 2008. These loans were accounted for at fair value on the acquisition date, which included the impact of credit losses over the remaining life of the portfolio. Accordingly, no allowance for loan losses has been recorded for these loans.

Retail Banking

Selected income statement data

Year ended December 31, (in millions, except ratios)	2008	2007	2006
Noninterest revenue	**$ 4,951**	$ 3,763	$ 3,259
Net interest income	**7,659**	6,193	5,698
Total net revenue	**12,610**	9,956	8,957
Provision for credit losses	**449**	79	114
Noninterest expense	**7,232**	6,166	5,667
Income before income tax expense	**4,929**	3,711	3,176
Net income	**$ 2,982**	$ 2,245	$ 1,922
Overhead ratio	**57%**	62%	63%
Overhead ratio excluding core deposit intangibles[a]	**54**	57	58

(a) Retail Banking uses the overhead ratio (excluding the amortization of core deposit intangibles ("CDI")), a non-GAAP financial measure, to evaluate the underlying expense trends of the business. Including CDI amortization expense in the overhead ratio calculation results in a higher overhead ratio in the earlier years and a lower overhead ratio in later years; this method would result in an improving overhead ratio over time, all things remaining equal. This ratio excludes Retail Banking's core deposit intangible amortization expense related to the Bank of New York transaction and the Bank One merger of $394 million, $460 million and $458 million for the years ended December 31, 2008, 2007 and 2006, respectively.

2008 compared with 2007

Retail Banking net income was $3.0 billion, up $737 million, or 33%, from the prior year. Total net revenue was $12.6 billion, up $2.7 billion, or 27%, reflecting the impact of the Washington Mutual transaction, wider deposit spreads, higher deposit-related fees, and higher deposit balances. The provision for credit losses was $449 million, compared with $79 million in the prior year, reflecting an increase in the allowance for loan losses for Business Banking loans due to higher estimated losses on the portfolio. Noninterest expense was $7.2 billion, up $1.1 billion, or 17%, from the prior year, due to the Washington Mutual transaction and investments in the retail distribution network.

2007 compared with 2006

Retail Banking net income was $2.2 billion, an increase of $323 million, or 17%, from the prior year. Total net revenue was $10.0 billion, up $1.0 billion, or 11%, benefiting from the following: the Bank of New York transaction; increased deposit-related fees; and growth in deposits. These benefits were offset partially by a shift to narrower-spread deposit products. The provision for credit losses was $79 million, compared with $114 million in the prior year. Noninterest expense was $6.2 billion, up $499 million, or 9%, from the prior year, driven by the Bank of New York transaction and investments in the retail distribution network.

Income (loss) before income tax expense	**(3,391)**	1,079	2,161
Net income (loss)	**$ (2,102)**	$ 680	$ 1,291
Overhead ratio	**44%**	51%	56%

2008 compared with 2007

Consumer Lending net loss was $2.1 billion, compared with net income of $680 million in the prior year. Total net revenue was $10.9 billion, up $3.6 billion, or 48%, driven by higher mortgage fees and related income (due primarily to positive MSR risk management results), the impact of the Washington Mutual transaction, higher loan balances and wider loan spreads.

The increase in mortgage fees and related income was primarily driven by higher net mortgage servicing revenue. Mortgage production revenue of $898 million was up $18 million, as higher mortgage origination volume was predominantly offset by an increase in reserves related to the repurchase of previously sold loans and markdowns of the mortgage warehouse. Net mortgage servicing revenue (which includes loan servicing revenue, MSR risk management results and other changes in fair value) was $2.7 billion, an increase of $1.5 billion, or 124%, from the prior year. Loan servicing revenue was $3.3 billion, an increase of $924 million. Third-party loans serviced increased 91%, primarily due to the Washington Mutual transaction. MSR risk management results were $1.5 billion, compared with $411 million in the prior year. Other changes in fair value of the MSR asset were negative $2.1 billion, compared with negative $1.5 billion in the prior year.

The provision for credit losses was $9.5 billion, compared with $2.5 billion in the prior year. The provision reflected weakness in the home equity and mortgage portfolios (see Retail Financial Services discussion of the provision for credit losses for further detail).

Noninterest expense was $4.8 billion, up $1.1 billion, or 30%, from the prior year, reflecting higher mortgage reinsurance losses, the impact of the Washington Mutual transaction and higher servicing expense due to increased delinquencies and defaults.

2007 compared with 2006

Consumer Lending net income was $680 million, a decrease of $611 million, or 47%, from the prior year. Total net revenue was $7.3 billion, up $1.5 billion, or 25%, benefiting from positive MSR risk management results, increased mortgage production revenue, wider loan spreads and the absence of a prior-year $233 million loss related to $13.3 billion of mortgage loans transferred to held-for-sale. These benefits were offset partially by the sale of the insurance business.

Mortgage production revenue was $880 million, up $576 million, reflecting the impact of an increase in mortgage loan originations and the classification of certain loan origination costs as expense (loan origination costs previously netted against revenue commenced being recorded as an expense in the first quarter of 2007 due to the adoption of SFAS 159). These benefits were offset partially by markdowns of $241 million on the mortgage warehouse and pipeline. Net mortgage servicing revenue, which includes loan servicing revenue, MSR risk management results and other changes in fair value, was $1.2 billion, compared with $314 million in the prior year. Loan servicing revenue of $2.3 billion increased $195 million on 17% growth in third-party loans serviced. MSR risk management results were positive $411 million compared with negative $385 million in the prior year. Other changes in fair value of the MSR asset were negative $1.5 billion, compared with negative $1.4 billion in the prior year.

The provision for credit losses was $2.5 billion, compared with $447 million in the prior year. The increase in the provision was due to the home equity and subprime mortgage portfolios (see Retail Financial Services discussion of the provision for credit losses for further detail).

Noninterest expense was $3.7 billion, an increase of $479 million, or 15%. The increase reflected the classification of certain loan origination costs due to the adoption of SFAS 159; higher servicing costs due to increased delinquencies and defaults; higher production expense due to growth in originations; and increased depreciation expense on owned automobiles subject to operating leases. These increases were offset partially by the sale of the insurance business.

Nonperforming assets[(f)(g)(h)]	**$ 8,653**	$ 3,084	$ 1,658
Allowance for loan losses to ending loans	**2.36%**	1.24%	0.64%
Allowance for loan losses to ending loans excluding purchased credit-impaired loans[(a)]	**3.16**	1.24	0.64

(a) Excludes the impact of purchased credit-impaired loans accounted for under SOP 03-3 that were acquired as part of the Washington Mutual transaction. Under SOP 03-3, these loans were accounted for at fair value on the acquisition date, which includes the impact of estimated credit losses over the remaining lives of the loans. Accordingly, no charge-offs and no allowance for loan losses has been recorded for these loans.
(b) Average loans included loans held-for-sale of $2.8 billion, $10.6 billion and $16.1 billion for the years ended December 31, 2008, 2007 and 2006, respectively. These amounts were excluded when calculating the net charge-off rate.
(c) Excluded loans eligible for repurchase as well as loans repurchased from GNMA pools that are insured by U.S. government agencies of $3.2 billion, $1.2 billion and $960 million, at December 31, 2008, 2007 and 2006, respectively. These amounts were excluded, as reimbursement is proceeding normally.
(d) Excluded loans that are 30 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program of $824 million, $663 million and $464 million at December 31, 2008, 2007 and 2006, respectively. These amounts are excluded as reimbursement is proceeding normally.
(e) Excludes purchased credit-impaired loans. The 30+ day delinquency rate for these loans was 17.89% at December 31, 2008. There were no purchased credit-impaired loans at December 31, 2007 and 2006.
(f) Nonperforming assets excluded (1) loans eligible for repurchase as well as loans repurchased from GNMA pools that are insured by U.S. government agencies of $3.3 billion, $1.5 billion and $1.2 billion at December 31, 2008, 2007 and 2006, respectively, and (2) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program of $437 million, $417 million and $387 million at December 31, 2008, 2007 and 2006, respectively. These amounts for GNMA and student loans are excluded, as reimbursement is proceeding normally.
(g) During the second quarter of 2008, the policy for classifying subprime mortgage and home equity loans as nonperforming was changed to conform to all other home lending products. Amounts for 2007 have been revised to reflect this change. Amounts for 2006 have not been revised as the impact was not material.
(h) Excludes purchased credit-impaired loans accounted for under SOP 03-3 that were acquired as part of the Washington Mutual transaction. These loans are accounted for on a pool basis, and the pools are considered to be performing under SOP 03-3.

Total net mortgage servicing revenue	**2,723**	1,214	314
Mortgage fees and related income	**3,621**	2,094	618

(a) Included $14.2 billion and $11.9 billion of prime mortgage loans at fair value for the years ended December 31, 2008 and 2007, respectively.

Mortgage origination channels comprise the following:

Retail – Borrowers who are buying or refinancing a home through direct contact with a mortgage banker employed by the Firm using a branch office, the Internet or by phone. Borrowers are frequently referred to a mortgage banker by real estate brokers, home builders or other third parties.

Wholesale – A third-party mortgage broker refers loan applications to a mortgage banker at the Firm. Brokers are independent loan originators that specialize in finding and counseling borrowers but do not provide funding for loans.

Correspondent – Banks, thrifts, other mortgage banks and other financial institutions that sell closed loans to the Firm.

Correspondent negotiated transactions ("CNT") – Mid-to large-sized mortgage lenders, banks and bank-owned companies that sell loans or servicing to the Firm on an as-originated basis, excluding bulk servicing transactions.

Production revenue – Includes net gains or losses on originations and sales of prime and subprime mortgage loans and other production-related fees.

Net mortgage servicing revenue components: Servicing revenue – Represents all gross income earned from servicing third-party mortgage loans, including stated service fees, excess service fees, late fees and other ancillary fees.

Changes in MSR asset fair value due to inputs or assumptions in model – Represents MSR asset fair value adjustments due to changes in market-based inputs, such as interest rates and volatility, as well as updates to valuation assumptions used in the valuation model.

Changes in MSR asset fair value due to other changes – Includes changes in the MSR value due to modeled servicing portfolio runoff (or time decay).

Derivative valuation adjustments and other – Changes in the fair value of derivative instruments used to offset the impact of changes in market-based inputs to the MSR valuation model.

MSR risk management results – Includes changes in MSR asset fair value due to inputs or assumptions and derivative valuation adjustments and other.

Chase Card Services is one of the nation's largest card issuers with more than 168 million credit cards in circulation and more than $190 billion in managed loans. Customers used Chase cards to meet more than $368 billion worth of their spending needs in 2008. Chase has a market leadership position in building loyalty and rewards programs with many of the world's most respected brands and through its proprietary products, which include the Chase Freedom program.

Through its merchant acquiring business, Chase Paymentech Solutions, Chase is one of the leading processors of MasterCard and Visa payments.

JPMorgan Chase uses the concept of "managed basis" to evaluate the credit performance of its credit card loans, both loans on the balance sheet and loans that have been securitized. For further information, see Explanation and reconciliation of the Firm's use of non-GAAP financial measures on pages 50–51 of this Annual Report. Managed results exclude the impact of credit card securitizations on total net revenue, the provision for credit losses, net charge-offs and loan receivables. Securitization does not change reported net income; however, it does affect the classification of items on the Consolidated Statements of Income and Consolidated Balance Sheets.

The following discussion of CS' financial results reflects the acquisition of Washington Mutual's credit card operations, including $28.3 billion of managed credit card loans, as a result of the Washington Mutual transaction on September 25, 2008, and the dissolution of the Chase Paymentech Solutions joint venture on November 1, 2008. See Note 2 on pages 135–140 of this Annual Report for more information concerning these transactions.

Financial ratios			
ROE	**5%**	21%	23%
Overhead ratio	**31**	32	34

2008 compared with 2007

Net income was $780 million, a decline of $2.1 billion, or 73%, from the prior year. The decrease was driven by a higher provision for credit losses, partially offset by higher total net revenue.

Average managed loans were $162.9 billion, an increase of $13.5 billion, or 9%, from the prior year. Excluding Washington Mutual, average managed loans were $155.9 billion. End-of-period managed loans were $190.3 billion, an increase of $33.3 billion, or 21%, from the prior year. Excluding Washington Mutual, end-of-period managed loans were $162.1 billion. The increases in both average managed loans and end-of-period managed loans were predominantly due to the impact of the Washington Mutual transaction and organic portfolio growth.

Managed total net revenue was $16.5 billion, an increase of $1.2 billion, or 8%, from the prior year. Net interest income was $13.8 billion, up $1.6 billion, or 13%, from the prior year, driven by the Washington Mutual transaction, higher average managed loan balances, and wider loan spreads. These benefits were offset partially by the effect of higher revenue reversals associated with higher charge-offs. Noninterest revenue was $2.7 billion, a decrease of $327 million, or 11%, from the prior year, driven by increased rewards expense, lower securitization income driven by higher credit losses, and higher volume-driven payments to partners; these were largely offset by increased interchange income, benefiting from a 4% increase in charge volume, as well as the impact of the Washington Mutual transaction.

The managed provision for credit losses was $10.1 billion, an increase of $4.3 billion, or 76%, from the prior year, due to an increase of $1.7 billion in the allowance for loan losses and a higher level of charge-offs. The managed net charge-off rate increased to 5.01%, up from 3.68% in the prior year. The 30-day managed delinquency rate was 4.97%, up from 3.48% in the prior year. Excluding Washington Mutual, the managed net charge-off rate was 4.92% and the 30-day delinquency rate was 4.36%.

Noninterest expense was $5.1 billion, an increase of $226 million, or 5%, from the prior year, predominantly due to the impact of the Washington Mutual transaction.

2007 compared with 2006

Net income of $2.9 billion was down $287 million, or 9%, from the prior year. Prior-year results benefited from significantly lower net charge-offs following the change in bankruptcy legislation in the fourth quarter of 2005. The increase in net charge-offs was offset partially by higher revenue.

End-of-period managed loans of $157.1 billion increased $4.2 billion, or 3%, from the prior year. Average managed loans of $149.3 billion increased $8.2 billion, or 6%, from the prior year. The increases in both end-of-period and average managed loans resulted from organic growth.

Managed total net revenue was $15.2 billion, an increase of $490 million, or 3%, from the prior year. Net interest income was $12.2 billion, up $388 million, or 3%, from the prior year. The increase in net interest income was driven by a higher level of fees and higher average loan balances. These benefits were offset partially by narrower loan spreads, the discontinuation of certain billing practices (including the elimination of certain over-limit fees and the two-cycle billing method for calculating finance charges beginning in the second quarter of 2007) and the effect of higher revenue reversals associated with higher charge-offs. Noninterest revenue was $3.0 billion, an increase of $102 million, or 3%, from the prior year. The increase reflected a higher level of fee-based revenue and increased net interchange income, which benefited from higher charge volume. Charge volume growth was 4%, reflecting a 9% increase in sales volume, offset primarily by a lower level of balance transfers, the result of more targeted marketing efforts.

The managed provision for credit losses was $5.7 billion, an increase of $1.1 billion, or 24%, from the prior year. The increase was primarily due to a higher level of net charge-offs (the prior year benefited from the change in bankruptcy legislation in the fourth quarter of 2005) and an increase in the allowance for loan losses, driven by higher estimated net charge-offs in the portfolio. The managed net charge-off rate was 3.68%, up from 3.33% in the prior year. The 30-day managed delinquency rate was 3.48%, up from 3.13% in the prior year.

Noninterest expense was $4.9 billion, a decrease of $172 million, or 3%, compared with the prior year, primarily due to lower marketing expense and lower fraud-related expense, partially offset by higher volume-related expense.

The following are brief descriptions of selected business metrics within Card Services.

- **Charge volume** – Represents the dollar amount of cardmember purchases, balance transfers and cash advance activity.
- **Net accounts opened** – Includes originations, purchases and sales.
- **Merchant acquiring business** – Represents a business that processes bank card transactions for merchants.
  - –**Bank card volume** – Represents the dollar amount of transactions processed for merchants.
  - –**Total transactions** – Represents the number of transactions and authorizations processed for merchants.

90+ day delinquency rate	**2.09**	1.65	1.50

(a) Represents total net revenue less provision for credit losses.
(b) Pretax return on average managed outstandings.
(c) Results for 2008 included approximately 13 million credit card accounts acquired in the Washington Mutual transaction. Results for 2006 included approximately 30 million accounts from loan portfolio acquisitions.
(d) The Chase Paymentech Solutions joint venture was dissolved effective November 1, 2008. For the period January 1, 2008 through October 31, 2008, the data presented represent activity for the Chase Paymentech Solutions joint venture and for the period November 1, 2008 through December 31, 2008, the data presented represent activity for Chase Paymentech Solutions.
(e) Results for 2008 reflect the impact of purchase accounting adjustments related to the Washington Mutual transaction.
(f) Based on loans on a reported basis.
(g) Statistics are only presented for periods after September 25, 2008, the date of the Washington Mutual transaction.
(h) As a percentage of average managed outstandings.
(i) The 2008 allowance for loan losses included an amount related to loans acquired in the Washington Mutual transaction.

The financial information presented below reconciles reported basis and managed basis to disclose the effect of securitizations.

COMMERCIAL BANKING

Commercial Banking serves more than 26,000 clients nationally, including corporations, municipalities, financial institutions and not-for-profit entities with annual revenue generally ranging from $10 million to $2 billion, and nearly 30,000 real estate investors/owners. Delivering extensive industry knowledge, local expertise and dedicated service, CB partners with the Firm's other businesses to provide comprehensive solutions, including lending, treasury services, investment banking and asset management, to meet its clients' domestic and international financial needs.

On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual from the FDIC, adding approximately $44.5 billion in loans to the Commercial Term Lending, Real Estate Banking and Other businesses in Commercial Banking. On October 1, 2006, JPMorgan Chase completed the acquisition of The Bank of New York's consumer, business banking and middle-market banking businesses, adding approximately $2.3 billion in loans and $1.2 billion in deposits in Commercial Banking.

(a) Revenue from investment banking products sold to CB clients and commercial card revenue is included in all other income.

2008 compared with 2007

Net income was $1.4 billion, an increase of $305 million, or 27%, from the prior year, due to growth in total net revenue including the impact of the Washington Mutual transaction, partially offset by a higher provision for credit losses.

Record total net revenue of $4.8 billion increased $674 million, or 16%. Net interest income of $3.3 billion increased $456 million, or 16%, driven by double-digit growth in liability and loan balances and the impact of the Washington Mutual transaction, partially offset by spread compression in the liability and loan portfolios. Noninterest revenue was $1.5 billion, up $218 million, or 17%, due to higher deposit and lending-related fees.

On a client segment basis, Middle Market Banking revenue was $2.9 billion, an increase of $250 million, or 9%, from the prior year due predominantly to higher deposit-related fees and growth in liability and loan balances. Revenue from Commercial Term Lending, a new client segment established as a result of the Washington Mutual transaction encompassing multi-family and commercial mortgage loans, was $243 million. Mid-Corporate Banking revenue was $921 million, an increase of $106 million, or 13%, reflecting higher loan balances, investment banking revenue, and deposit-related fees. Real Estate Banking revenue of $413 million decreased $8 million, or 2%.

Provision for credit losses was $464 million, an increase of $185 million, or 66%, compared with the prior year, reflecting a weakening credit environment and loan growth. Net charge-offs were $288 million (0.35% net charge-off rate), compared with $44 million (0.07% net charge-off rate) in the prior year, predominantly related to an increase in real estate charge-offs. The allowance for loan losses increased $1.1 billion, which primarily reflected the impact of the Washington Mutual transaction. Nonperforming assets were $1.1 billion, an increase of $1.0 billion compared with the prior year, predominantly reflecting the Washington Mutual transaction and higher real estate-related balances.

Noninterest expense was $1.9 billion, a decrease of $12 million, or 1%, from the prior year, due to lower performance-based incentive compensation and volume-based charges from service providers, predominantly offset by the impact of the Washington Mutual transaction.

2007 compared with 2006

Net income was $1.1 billion, an increase of $124 million, or 12%, from the prior year due primarily to growth in total net revenue, partially offset by higher provision for credit losses.

Record total net revenue of $4.1 billion increased $303 million, or 8%. Net interest income of $2.8 billion increased $113 million, or 4%, driven by double-digit growth in liability balances and loans, which reflected organic growth and the Bank of New York transaction, largely offset by the continued shift to narrower-spread liability products and spread compression in the loan and liability portfolios. Noninterest revenue was $1.3 billion, up $190 million, or 18%, due to increased deposit-related fees, higher investment banking revenue, and gains on sales of securities acquired in the satisfaction of debt.

On a segment basis, Middle Market Banking revenue was $2.7 billion, an increase of $154 million, or 6%, primarily due to the Bank of New York transaction, higher deposit-related fees and growth in investment banking revenue. Mid-Corporate Banking revenue was $815 million, an increase of $159 million, or 24%, reflecting higher

lending revenue, investment banking revenue, and gains on sales of securities acquired in the satisfaction of debt. Real Estate Banking revenue of $421 million decreased $37 million, or 8%.

Provision for credit losses was $279 million, compared with $160 million in the prior year. The increase in the allowance for credit losses reflected portfolio activity including slightly lower credit quality as well as growth in loan balances. The allowance for loan losses to average loans retained was 2.81%, compared with 2.86% in the prior year.

Noninterest expense was $2.0 billion, a decrease of $21 million, or 1%, largely due to lower compensation expense driven by the absence of prior-year expense from the adoption of SFAS 123R, partially offset by expense growth related to the Bank of New York transaction.

(a) Represents the total revenue related to investment banking products sold to CB clients.

(b) Results for 2008 include total net revenue and average loans acquired in the Washington Mutual transaction.

(c) Liability balances include deposits and deposits swept to on-balance sheet liabilities such as commercial paper, federal funds purchased and securities loaned or sold under repurchase agreements.

(d) Purchased credit-impaired wholesale loans accounted for under SOP 03-3 that were acquired in the Washington Mutual transaction are considered nonperforming loans because the timing and amount of expected cash flows are not reasonably estimable. These nonperforming loans were included when calculating the allowance coverage ratio, the allowance for loan losses to nonperforming loans ratio, and the nonperforming loans to average loans ratio. The carrying amount of these purchased credit-impaired loans was $224 million at December 31, 2008.

(e) Beginning in 2008, the allowance for loan losses included an amount related to loans acquired in the Washington Mutual transaction and the Bear Stearns merger.

(f) Loans held-for-sale and loans accounted for at fair value were excluded when calculating the allowance coverage ratio and the net charge-off rate.

(g) The September 30, 2008, ending loan balance of $44.5 billion acquired in the Washington Mutual transaction is treated as if it had been part of the loan balance for the entire third quarter of 2008.

TREASURY & SECURITIES SERVICES

TSS is a global leader in transaction, investment and information services. TSS is one of the world's largest cash management providers and a leading global custodian. TS provides cash management, trade, wholesale card and liquidity products and services to small and mid-sized companies, multinational corporations, financial institutions and government entities. TS partners with the Commercial Banking, Retail Financial Services and Asset Management businesses to serve clients firmwide. As a result, certain TS revenue is included in other segments' results. WSS holds, values, clears and services securities, cash and alternative investments for investors and broker-dealers, and manages depositary receipt programs globally.

As a result of the transaction with the Bank of New York on October 1, 2006, selected corporate trust businesses were transferred from TSS to the Corporate/Private Equity segment and are reported in discontinued operations.

(a) TSS is charged a credit reimbursement related to certain exposures managed within IB credit portfolio on behalf of clients shared with TSS. Beginning in first quarter 2009, income statement and balance sheet items for credit portfolio activity related to joint IB/TSS clients will be reflected proportionally in the respective IB and TSS financials. This will replace the previous approach whereby a credit reimbursement was charged to TSS by IB.

(b) Pretax margin represents income before income tax expense divided by total net revenue, which is a measure of pretax performance and another basis by which management evaluates its performance and that of its competitors.

(c) Loan balances include wholesale overdrafts, commercial card and trade finance loans.

(d) Liability balances include deposits and deposits swept to on-balance sheet liabilities such as commercial paper, federal funds purchased and securities loaned or sold under repurchase agreements.

2008 compared with 2007

Net income was a record $1.8 billion, an increase of $370 million, or 26%, from the prior year, driven by higher total net revenue. This increase was largely offset by higher noninterest expense.

Total net revenue was a record $8.1 billion, an increase of $1.2 billion, or 17%, from the prior year. Worldwide Securities Services posted record net revenue of $4.6 billion, an increase of $647 million, or 16%, from the prior year. The growth was driven by wider spreads in securities lending, foreign exchange and liability products, increased product usage by new and existing clients (largely in custody, fund services, alternative investment services and depositary receipts) and higher liability balances, reflecting increased client deposit activity resulting from recent market conditions. These benefits were offset partially by market depreciation. Treasury Services posted record net revenue of $3.6 billion, an increase of $542 million, or 18%, reflecting higher liability balances and volume growth in electronic funds transfer products and trade loans. Revenue growth from higher liability balances reflects increased client deposit activity resulting from recent market conditions as well as organic growth. TSS firmwide net revenue, which includes Treasury Services net revenue recorded in other lines of business, grew to $11.1 billion, an increase of $1.5 billion, or 16%. Treasury Services firmwide net revenue grew to $6.5 billion, an increase of $869 million, or 15%.

Noninterest expense was $5.2 billion, an increase of $643 million, or 14%, from the prior year, reflecting higher expense related to business and volume growth as well as continued investment in new product platforms.

2007 compared with 2006

Net income was a record $1.4 billion, an increase of $307 million, or 28%, from the prior year, driven by record total net revenue, partially offset by higher noninterest expense.

Total net revenue was $6.9 billion, an increase of $836 million, or 14%, from the prior year. Worldwide Securities Services net revenue of $3.9 billion was up $615 million, or 19%. The growth was driven by increased product usage by new and existing clients (primarily custody, securities lending, depositary receipts and fund services), market appreciation on assets under custody, and wider spreads on securities lending. These gains were offset partially by spread compression on liability products. Treasury Services net revenue was $3.0 billion, an increase of $221 million, or 8%, from the prior year. The results were driven by growth in electronic transaction volumes and higher liability balances, offset partially by a shift to narrower-spread liability products. TSS firmwide net revenue, which includes Treasury Services net revenue recorded in other lines of business, grew to $9.6 billion, up $1.0 billion, or 12%. Treasury Services firmwide net revenue grew to $5.6 billion, up $391 million, or 7%.

Noninterest expense was $4.6 billion, an increase of $314 million, or 7%, from the prior year, reflecting higher expense related to business and volume growth, as well as investment in new product platforms.

Treasury & Securities Services firmwide metrics include revenue recorded in the CB, Retail Banking and AM lines of business and excludes foreign exchange ("FX") revenue recorded in IB for TSS-related FX activity. In order to capture the firmwide impact of TS and TSS products and revenue, management reviews firmwide metrics such as liability balances, revenue and overhead ratios in assessing financial performance for TSS. Firmwide metrics are necessary in order to understand the aggregate TSS business.

(a) TSS firmwide FX revenue, which includes FX revenue recorded in TSS and FX revenue associated with TSS customers who are FX customers of IB, was $880 million, $552 million and $445 million for the years ended December 31, 2008, 2007 and 2006, respectively.

(b) Firmwide liability balances include TS' liability balances recorded in the Commercial Banking line of business.

(c) Overhead ratios have been calculated based upon firmwide revenue and TSS and TS expense, respectively, including those allocated to certain other lines of business. FX revenue and expense recorded in IB for TSS-related FX activity are not included in this ratio.

(d) International electronic funds transfer includes non-U.S. dollar ACH and clearing volume.

(e) Wholesale cards issued include domestic commercial card, stored value card, prepaid card and government electronic benefit card products.

ASSET MANAGEMENT

AM, with assets under supervision of $1.5 trillion, is a global leader in investment and wealth management. AM clients include institutions, retail investors and high-net-worth individuals in every major market throughout the world. AM offers global investment management in equities, fixed income, real estate, hedge funds, private equity and liquidity, including money market instruments and bank deposits. AM also provides trust and estate, banking and brokerage services to high-net-worth clients, and retirement services for corporations and individuals. The majority of AM's client assets are in actively managed portfolios.

On May 30, 2008, JPMorgan Chase merged with The Bear Stearns Companies, Inc. The merger resulted in the addition of a new client segment, Bear Stearns Brokerage, but did not materially affect balances or business metrics.

(a) In 2008, certain clients were transferred from Private Bank to Private Wealth Management. Prior periods have been revised to conform to this change.
(b) Pretax margin represents income before income tax expense divided by total net revenue, which is a measure of pretax performance and another basis by which management evaluates its performance and that of its competitors.

2008 compared with 2007

Net income was $1.4 billion, a decline of $609 million, or 31%, from the prior year, driven by lower total net revenue offset partially by lower noninterest expense.

Total net revenue was $7.6 billion, a decrease of $1.1 billion, or 12%, from the prior year. Noninterest revenue was $6.1 billion, a decline of $1.4 billion, or 19%, due to lower performance fees and the effect of lower markets, including the impact of lower market valuations of seed capital investments. The lower results were offset partially by the benefit of the Bear Stearns merger and increased revenue from net asset inflows. Net interest income was $1.5 billion, up $358 million, or 31%, from the prior year, due to higher deposit and loan balances and wider deposit spreads.

Private Bank revenue grew 9% to $2.6 billion, due to increased deposit and loan balances and net asset inflows, partially offset by the effect of lower markets and lower performance fees. Institutional revenue declined 30% to $1.8 billion due to lower performance fees, partially offset by net liquidity inflows. Retail revenue declined 33% to $1.6 billion due to the effect of lower markets, including the impact of lower market valuations of seed capital investments and net equity outflows. Private Wealth Management revenue grew 4% to $1.4 billion due to higher deposit and loan balances. Bear Stearns Brokerage contributed $237 million to revenue.

The provision for credit losses was $85 million, compared with a benefit of $18 million in the prior year, reflecting an increase in loan balances, higher net charge-offs and a weakening credit environment.

Noninterest expense was $5.3 billion, down $217 million, or 4%, compared with the prior year due to lower performance-based compensation, largely offset by the effect of the Bear Stearns merger and higher compensation expense resulting from increased average headcount.

2007 compared with 2006

Net income was a record $2.0 billion, an increase of $557 million, or 40%, from the prior year. Results benefited from record total net revenue, partially offset by higher noninterest expense.

Total net revenue was $8.6 billion, an increase of $1.8 billion, or 27%, from the prior year. Noninterest revenue, primarily fees and commissions, was $7.5 billion, up $1.7 billion, or 29%, largely due to increased assets under management and higher performance and placement fees. Net interest income was $1.2 billion, up $189 million, or 19%, from the prior year, largely due to higher deposit and loan balances.

Institutional revenue grew 28% to $2.5 billion, due to net asset inflows and performance fees. Private Bank revenue grew 40% to $2.4 billion, due to higher assets under management, performance and placement fees, and increased loan and deposit balances. Retail revenue grew 28%, to $2.4 billion, primarily due to market appreciation and net asset inflows. Private Wealth Management revenue grew 8% to $1.3 billion, reflecting higher assets under management and higher deposit balances.

The provision for credit losses was a benefit of $18 million, compared with a benefit of $28 million in the prior year.

Noninterest expense was $5.5 billion, an increase of $937 million, or 20%, from the prior year. The increase was due primarily to higher performance-based compensation expense and investments in all business segments.

(b) Derived from following rating services: Lipper for the United States and Taiwan; Micropal for the United Kingdom, Luxembourg and Hong Kong; and Nomura for Japan.

(c) Reflects the transfer in 2007 of held-for-investment prime mortgage loans transferred from AM to Corporate within the Corporate/Private Equity segment.

AM's client segments comprise the following:

Institutional brings comprehensive global investment services – including asset management, pension analytics, asset-liability management and active risk budgeting strategies – to corporate and public institutions, endowments, foundations, not-for-profit organizations and governments worldwide.

Retail provides worldwide investment management services and retirement planning and administration through third-party and direct distribution of a full range of investment vehicles.

The **Private Bank** addresses every facet of wealth management for ultra-high-net-worth individuals and families worldwide, including investment management, capital markets and risk management, tax and estate planning, banking, capital raising and specialty-wealth advisory services.

Private Wealth Management offers high-net-worth individuals, families and business owners in the United States comprehensive wealth management solutions, including investment management, capital markets and risk management, tax and estate planning, banking and specialty-wealth advisory services.

Bear Stearns Brokerage provides investment advice and wealth management services to high-net-worth individuals, money managers, and small corporations.

J.P. Morgan Asset Management has established two measures of its overall performance.

- Percentage of assets under management in funds rated 4 and 5 stars (3 year). Mutual fund rating services rank funds based on their risk-adjusted performance over various periods. A 5 star rating is the best and represents the top 10% of industry wide ranked funds. A 4 star rating represents the next 22% of industry wide ranked funds. The worst rating is a 1 star rating.
- Percentage of assets under management in first- or second-quartile funds (one, three and five years). Mutual fund rating services rank funds according to a peer-based performance system, which measures returns according to specific time and fund classification (small, mid, multi and large cap).

Assets under supervision

2008 compared with 2007

Assets under supervision ("AUS") were $1.5 trillion, a decrease of $76 billion, or 5%, from the prior year. Assets under management ("AUM") were $1.1 trillion, down $60 billion, or 5%, from the prior year. The decrease was due to the effect of lower markets and non-liquidity outflows, predominantly offset by liquidity product inflows across all segments and the addition of Bear Stearns assets under management. Custody, brokerage, administration and deposit balances were $363 billion, down $16 billion due to the effect of lower markets on brokerage and custody balances, offset by the addition of Bear Stearns Brokerage. The Firm also has a 43% interest in American Century Companies, Inc., whose AUM totaled $70 billion and $102 billion at December 31, 2008 and 2007, respectively, which are excluded from the AUM above.

2007 compared with 2006

AUS were $1.6 trillion, an increase of $225 billion, or 17%, from the prior year. AUM were $1.2 trillion, up 18%, or $180 billion, from the prior year. The increase in AUM was the result of net asset inflows into liquidity and alternative products and market appreciation across all segments. Custody, brokerage, administration and deposit balances were $379 billion, up $45 billion. The Firm also has a 44% interest in American Century Companies, Inc., whose AUM totaled $102 billion and $103 billion at December 31, 2007 and 2006, respectively, which are excluded from the AUM above.

(a) Excludes assets under management of American Century Companies, Inc., in which the Firm had a 43%, 44% and 43% ownership at December 31, 2008, 2007 and 2006, respectively.
(b) In 2008, certain clients were transferred from Private Bank to Private Wealth Management. Prior periods have been revised to conform to this change.
(c) Includes $15 billion for assets under management and $68 billion for assets under supervision from the Bear Stearns merger in the second quarter of 2008.

The Corporate/Private Equity sector comprises Private Equity, Treasury, corporate staff units and expense that is centrally managed. Treasury manages capital, liquidity, interest rate and foreign exchange risk and the investment portfolio for the Firm. The corporate staff units include Central Technology and Operations, Internal Audit, Executive Office, Finance, Human Resources, Marketing & Communications, Legal & Compliance, Corporate Real Estate and General Services, Risk Management, Corporate Responsibility and Strategy & Development. Other centrally managed expense includes the Firm's occupancy and pension-related expense, net of allocations to the business.

Income tax expense (benefit)[g]	**(535)**	788	(1,179)
Income (loss) from continuing operations	**(1,349)**	1,885	47
Income from discontinued operations[h]	**—**	—	795
Income before extraordinary gain	**(1,349)**	1,885	842
Extraordinary gain[i]	**1,906**	—	—
Net income	**$ 557**	$ 1,885	$ 842

(a) Included losses on preferred equity interests in Fannie Mae and Freddie Mac in 2008.
(b) The Firm adopted SFAS 157 in the first quarter of 2007. See Note 4 on pages 141–155 of this Annual Report for additional information.
(c) Included gain on sale of MasterCard shares in 2008.
(d) Included a gain from the dissolution of the Chase Paymentech Solutions joint venture and proceeds from the sale of Visa shares in its initial public offering in 2008.
(e) Represents an accounting conformity loan loss reserve provision related to the acquisition of Washington Mutual Bank's banking operations. For a further discussion, see Consumer Credit Portfolio on page 104 of this Annual Report.
(f) Included a release of credit card litigation reserves in 2008 and insurance recoveries related to settlement of the Enron and WorldCom class action litigations and for certain other material legal proceedings of $512 million for full year 2006.
(g) Includes tax benefits recognized upon resolution of tax audits.
(h) Included a $622 million gain from the sale of selected corporate trust businesses in 2006.
(i) Effective September 25, 2008, JPMorgan Chase acquired Washington Mutual's banking operations from the FDIC for $1.9 billion. The fair value of the Washington Mutual net assets acquired exceeded the purchase price, which resulted in negative goodwill. In accordance with SFAS 141, nonfinancial assets that are not held-for-sale were written down against that negative goodwill. The negative goodwill that remained after writing down nonfinancial assets was recognized as an extraordinary gain in 2008.
(j) In November 2008, the Firm transferred $5.8 billion of higher quality credit card loans from the legacy Chase portfolio to a securitization trust previously established by Washington Mutual ("the Trust"). As a result of converting higher credit quality Chase-originated on-book receivables to the Trust's seller's interest which has a higher overall loss rate reflective of the total assets within the Trust, approximately $400 million of incremental provision expense was recorded during the fourth quarter. This incremental provision expense was recorded in the Corporate segment as the action related to the acquisition of Washington Mutual's banking operations. For further discussion of credit card securitizations, see Note 16 on page 182 of this Annual Report.
(k) Includes $9 million for credit card securitizations related to the Washington Mutual transaction.

2008 compared with 2007

Net income for Corporate/Private Equity was $557 million, compared with net income of $1.9 billion in the prior year. This segment includes the results of Private Equity and Corporate business segments, as well as merger-related items.

Net loss for Private Equity was $690 million, compared with net income of $2.2 billion in the prior year. Net revenue was negative $963 million, a decrease of $4.9 billion, reflecting Private Equity losses of $894 million, compared with gains of $4.1 billion in the prior year. Noninterest expense was negative $120 million, a decrease of $469 million from the prior year, reflecting lower compensation expense.

Net income for Corporate was $1.5 billion, compared with a net loss of $150 million in the prior year. Net revenue was $1.0 billion, an increase of $580 million. Excluding merger-related items, net revenue was $1.7 billion, an increase of $1.2 billion. Net revenue included a gain of $1.5 billion on the proceeds from the sale of Visa shares in its initial public offering, $1.0 billion on the dissolution of the Chase Paymentech Solutions joint venture, and $668 million from the sale of MasterCard shares, partially offset by losses of $1.1 billion on preferred securities of Fannie Mae and Freddie Mac and $464 million related to the offer to repurchase auction-rate securities. 2007 included a gain of $234 million on the sale of MasterCard shares. Noninterest expense was negative $736 million, compared with $959 million in the prior year, driven mainly by lower litigation expense.

Merger-related items were a net loss of $2.1 billion compared with a net loss of $130 million in the prior year. Washington Mutual merger-related items included conforming loan loss reserve of $1.5 billion, credit card related loan loss reserves of $403 million and net merger-related costs of $138 million. Bear Stearns merger-related included a net loss of $423 million, which represented JPMorgan Chase's 49.4% ownership in Bear Stearns losses from April 8 to May 30, 2008, and net merger-related costs of $665 million. 2007 included merger costs of $209 million related to the Bank One and Bank of New York transactions.

2007 compared with 2006

Net income was $1.9 billion, compared with $842 million in the prior year, benefiting from strong Private Equity gains, partially offset by higher expense. Prior-year results also included Income from discontinued operations of $795 million, which included a one-time gain of $622 million from the sale of selected corporate trust businesses.

Net income for Private Equity was $2.2 billion, compared with $627 million in the prior year. Total net revenue was $4.0 billion, an increase of $2.8 billion. The increase was driven by Private Equity gains of $4.1 billion, compared with $1.3 billion, reflecting a higher level of gains and the change in classification of carried interest to compensation expense. Total noninterest expense was $589 million, an increase of $422 million from the prior year. The increase was driven by higher compensation expense, reflecting the change in the classification of carried interest.

Net loss for Corporate was $150 million, compared with a net loss of $391 million in the prior year. Corporate total net revenue was $452 million, an increase of $1.6 billion. Revenue benefited from net security gains compared with net security losses in the prior year and improved net interest spread. Total noninterest expense was $959 million, an increase of $284 million from the prior year. The increase reflected higher net litigation expense, driven by credit card-related litigation and the absence of prior-year insurance recoveries related to certain material litigation, partially offset by lower compensation expense.

Net loss for merger costs related to the Bank One and the Bank of New York transactions were $130 million, compared with a loss of $189 million in the prior year. Merger costs were $209 million, compared with $305 million in the prior year.

(d) Includes an accounting conformity loan loss reserve provision related to the Washington Mutual transaction in 2008. 2008 also reflects items related to the Bear Stearns merger, which included Bear Stearns' losses, merger costs, Bear Stearns asset management liquidation costs and Bear Stearns private client services broker retention expense. Prior periods represent costs related to the Bank One transaction in 2004 and the Bank of New York transaction in 2006.
(e) Included a $622 million gain from the sale of selected corporate trust business in 2006.

Private equity portfolio

2008 compared with 2007

The carrying value of the private equity portfolio at December 31, 2008, was $6.9 billion, down from $7.2 billion at December 31, 2007. The portfolio decrease was primarily driven by unfavorable valuation adjustments on existing investments, partially offset by new investments, and the addition of the Bear Stearns portfolios. The portfolio represented 5.8% of the Firm's stockholders' equity less goodwill at December 31, 2008, down from 9.2% at December 31, 2007.

2007 compared with 2006

The carrying value of the private equity portfolio at December 31, 2007, was $7.2 billion, up from $6.1 billion at December 31, 2006. The portfolio increase was due primarily to favorable valuation adjustments on nonpublic investments and new investments, partially offset by sales activity. The portfolio represented 9.2% of the Firm's stockholders' equity less goodwill at December 31, 2007, up from 8.6% at December 31, 2006.

(a) Results for 2008 included a gain on the sale of MasterCard shares. All periods reflect repositioning of the Corporate investment securities portfolio and exclude gains/losses on securities used to manage risk associated with MSRs.
(b) Includes Chief Investment Office investment securities only.
(c) Held-for-investment prime mortgage loans were transferred from AM to the Corporate/Private Equity segment for risk management and reporting purposes. The initial transfer in 2007 had no material impact on the financial results of Corporate/Private Equity.
(d) Unrealized gains (losses) contain reversals of unrealized gains and losses that were recognized in prior periods and have now been realized.
(e) The Firm adopted SFAS 157 in the first quarter of 2007. For additional information, see Note 4 on pages 141–155 of this Annual Report.
(f) Included in principal transactions revenue in the Consolidated Statements of Income.
(g) For more information on the Firm's policies regarding the valuation of the private equity portfolio, see Note 4 on pages 141–155 of this Annual Report.
(h) Unfunded commitments to third-party equity funds were $1.4 billion, $881 million and $589 million at December 31, 2008, 2007 and 2006, respectively.

Consolidated Balance Sheets overview

The following is a discussion of the significant changes in the Consolidated Balance Sheets from December 31, 2007.

Deposits with banks; federal funds sold and securities purchased under resale agreements; securities borrowed; federal funds purchased and securities loaned or sold under repurchase agreements

The Firm utilizes deposits with banks, federal funds sold and securities purchased under resale agreements, securities borrowed, and federal funds purchased and securities loaned or sold under repurchase agreements as part of its liquidity management activities to manage the Firm's cash positions and risk-based capital requirements and to support the Firm's trading and risk management activities. In particular, the Firm uses securities purchased under resale agreements and securities borrowed to provide funding or liquidity to clients by purchasing and borrowing clients' securities for the short-term. Federal funds purchased and securities loaned or sold under repurchase agreements are used as short-term funding sources for the Firm and to make securities available to clients for their short-term purposes. The increase from December 31, 2007, in deposits with banks reflected a higher level of interbank lending; a reclassification of deposits with the Federal Reserve Bank from cash and due from banks to deposits with banks reflecting a policy change of the Federal Reserve Bank to pay interest to depository institutions on reserve balances, and assets acquired as a result of the Bear Stearns merger. The increase in securities borrowed and securities purchased under resale agreements was related to assets acquired as a result of the Bear Stearns merger and growth in demand from clients for liquidity. The increase in securities sold under repurchase agreements reflected higher short-term funding requirements to fulfill clients' demand for liquidity and finance the Firm's AFS securities inventory, and the effect of the liabilities assumed in connection with the Bear Stearns merger. For additional information on the Firm's Liquidity Risk Management, see pages 88–92 of this Annual Report.

Trading assets and liabilities – debt and equity instruments

The Firm uses debt and equity trading instruments for both market-making and proprietary risk-taking activities. These instruments consist predominantly of fixed income securities, including government and corporate debt; equity, including convertible securities; loans, including certain prime mortgage and other loans warehoused by RFS and IB for sale or securitization purposes and accounted for at fair value under SFAS 159; and physical commodities inventories. The decreases in trading assets and liabilities – debt and equity instruments from December 31, 2007, reflected the effect of the challenging capital markets environment, particularly for debt securities, partially offset by positions acquired as a result of the Bear Stearns merger. For additional information, refer to Note 4 and Note 6 on pages 141–155 and 158–160, respectively, of this Annual Report.

Trading assets and liabilities – derivative receivables and payables

Derivative instruments enable end-users to increase, reduce or alter exposure to credit or market risks. The value of a derivative is derived from its reference to an underlying variable or combination of variables such as interest rate, credit, foreign exchange, equity or commodity prices or indices. JPMorgan Chase makes markets in derivatives for customers, is an end-user of derivatives for its principal risk-taking activities, and is also an end-user of derivatives to hedge or manage risks of market and credit exposures, modify the interest rate characteristics of related balance sheet instruments or meet longer-term investment objectives. The majority of the Firm's derivatives are entered into for market-making purposes. The increase in derivative receivables and payables from December 31, 2007, was primarily related to the decline in interest rates, widening credit spreads and volatile foreign exchange rates reflected in interest rate, credit and foreign exchange derivatives, respectively. The increase also included positions acquired in the Bear Stearns merger. For additional information, refer to derivative contracts, Note 4, Note 6 and Note 32 on pages 141–155, 158–160, and 214–217, respectively, of this Annual Report.

Securities
Almost all of the Firm's securities portfolio is classified as AFS and is used predominantly to manage the Firm's exposure to interest rate movements, as well as to make strategic longer-term investments. The AFS portfolio increased from December 31, 2007, predominantly as a result of purchases, partially offset by sales and maturities. For additional information related to securities, refer to the Corporate/Private Equity segment discussion, Note 4 and Note 12 on pages 73–75, 141–155 and 170–174, respectively, of this Annual Report.

Loans and allowance for loan losses
The Firm provides loans to a variety of customers, from large corporate and institutional clients to individual consumers. Loans increased from December 31, 2007, largely due to loans acquired in the Washington Mutual transaction, organic growth in lending in the wholesale businesses, particularly CB, and growth in the consumer prime mortgage portfolio driven by the decision to retain, rather than sell, new originations of nonconforming mortgage loans.

Both the consumer and wholesale components of the allowance for loan losses increased from the prior year reflecting the addition of noncredit-impaired loans acquired in the Washington Mutual transaction, including an increase to conform the allowance applicable to assets acquired from Washington Mutual to the Firm's loan loss methodologies. Excluding the Washington Mutual transaction the consumer allowance rose due to an increase in estimated losses for home equity, subprime mortgage, prime mortgage and credit card loans due to the effects of continued housing price declines, rising unemployment and a weakening economic environment. Excluding the Washington Mutual transaction, the increase in the wholesale allowance was due to the impact of the transfer of $4.9 billion of funded and unfunded leveraged lending loans in IB to the retained loan portfolio from the held-for-sale loan portfolio, the effect of a weakening credit environment and loan growth. For a more detailed discussion of the loan portfolio and the allowance for loan losses, refer to Credit Risk Management on pages 92–111, and Notes 4, 5, 14 and 15 on pages 141–155, 156–158, 175–178 and 178–180, respectively, of this Annual Report.

Accrued interest and accounts receivable; accounts payable and other liabilities
The Firm's accrued interest and accounts receivable consist of accrued interest receivable from interest-earning assets; receivables from customers (primarily from activities related to IB's Prime Services business); receivables from brokers, dealers and clearing organizations; and receivables from failed securities sales. The Firm's accounts payable and other liabilities consist of accounts payable to customers (primarily from activities related to IB's Prime Services business), payables to brokers, dealers and clearing organizations; payables from failed securities purchases; accrued expense, including for interest-bearing liabilities; and all other liabilities, including obligations to return securities received as collateral. The increase in accrued interest and accounts receivable from December 31, 2007, was due largely to the Bear Stearns merger, reflecting higher customer receivables in IB's Prime Services business and the Washington Mutual transaction. The increase in accounts payable and other liabilities was predominantly due to the Bear Stearns merger, reflecting higher customer payables (primarily related to IB's Prime Services business), as well as higher obligations to return securities received as collateral. For additional information, see Note 22 on page 202 of this Annual Report.

Goodwill
Goodwill arises from business combinations and represents the excess of the cost of an acquired entity over the net fair value amounts assigned to assets acquired and liabilities assumed. The increase in goodwill was due predominantly to the dissolution of Chase Paymentech Solutions joint venture, the merger with Bear Stearns, the purchase of an additional equity interest in Highbridge and tax-related purchase accounting adjustments associated with the Bank One merger, which increased goodwill attributed to IB. These items were offset partially by a decrease in goodwill attributed to TSS predominantly resulting from the sale of a previously consolidated subsidiary. For additional information, see Note 18 on pages 198–201 of this Annual Report.

Other intangible assets
The Firm's other intangible assets consist of MSRs, purchased credit card relationships, other credit card-related intangibles, core deposit intangibles, and other intangibles. MSRs increased due to the Washington Mutual transaction and the Bear Stearns merger; sales in RFS of originated loans; and purchases of MSRs. These increases in MSRs were partially offset by markdowns of the fair value of the MSR asset due to changes to inputs and assumptions in the MSR valuation model, including updates to prepayment assumptions to reflect current expectations, and to servicing portfolio run-offs. The decrease in other intangible assets reflects amortization expense associated with credit card-related and core deposit intangibles, partially offset by increases due to the dissolution of the Chase Paymentech Solutions joint venture, the purchase of an additional equity interest in Highbridge, and the acquisition of an institutional global custody portfolio. For additional information on MSRs and other intangible assets, see Note 18 on pages 198–201 of this Annual Report.

Other assets
The Firm's other assets consist of private equity and other investments, collateral received, corporate and bank-owned life insurance policies, premises and equipment, assets acquired in loan satisfaction (including real estate owned), and all other assets. The increase in other assets from December 31, 2007, was due to the Bear Stearns merger, which partly resulted in a higher volume of collateral received from customers, the Washington Mutual transaction, and the purchase of asset-backed commercial paper from money market mutual funds in connection with the Federal Reserve's Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility ("AML Facility"), which was established by the Federal Reserve on September 19, 2008, as a temporary lending facility to provide liquidity to eligible U.S. money market mutual funds. For additional information regarding the AML Facility, see Executive Overview and Note 21 on pages 41–44 and 202 respectively, of this Annual Report.

Deposits

The Firm's deposits represent a liability to customers, both retail and wholesale, related to non-brokerage funds held on their behalf. Deposits are generally classified by location (U.S. and non-U.S.), whether they are interest or noninterest-bearing, and by type (i.e., demand, money market deposit, savings, time or negotiable order of withdrawal accounts). Deposits help provide a stable and consistent source of funding for the Firm. Deposits were at a higher level compared with the level at December 31, 2007, predominantly from the deposits assumed in the Washington Mutual transaction, net increases in wholesale interest- and noninterest-bearing deposits in TSS, AM and CB. The increase in TSS was driven by both new and existing clients, and due to the deposit inflows related to the heightened volatility and credit concerns affecting the markets. For more information on deposits, refer to the TSS and RFS segment discussions on pages 68–69 and 57–62, respectively, and the Liquidity Risk Management discussion on pages 88–92 of this Annual Report. For more information on wholesale liability balances, including deposits, refer to the CB and TSS segment discussions on pages 66–67 and 68–69 of this Annual Report.

Commercial paper and other borrowed funds

The Firm utilizes commercial paper and other borrowed funds as part of its liquidity management activities to meet short-term funding needs, and in connection with a TSS liquidity management product whereby excess client funds, are transferred into commercial paper overnight sweep accounts. The increase in other borrowed funds was predominantly due to advances from Federal Home Loan Banks of $70.2 billion (net of maturities of $10.4 billion) that were assumed as part of the Washington Mutual transaction and nonrecourse advances from the Federal Reserve Bank of Boston ("FRBB") to fund purchases of asset-backed commercial paper from money market mutual funds, and other borrowings from the Federal Reserve under the Term Auction Facility program. For additional information on the Firm's Liquidity Risk Management and other borrowed funds, see pages 88–92 and Note 21 on page 202 of this Annual Report.

Long-term debt and trust preferred capital debt securities

The Firm utilizes long-term debt and trust preferred capital debt securities to provide cost-effective and diversified sources of funds and as critical components of the Firm's liquidity and capital management. Long-term debt and trust preferred capital debt securities increased from December 31, 2007, predominantly due to debt assumed in both the Bear Stearns merger and the Washington Mutual transaction, and debt issuances of $20.8 billion, which are guaranteed by the FDIC under its TLG Program. These increases were partially offset by net maturities and redemptions, including IB structured notes, the issuances of which are generally client-driven. For additional information on the Firm's long-term debt activities, see the Liquidity Risk Management discussion on pages 88–92 and Note 23 on pages 203–204 of this Annual Report.

Stockholders' equity

The increase in total stockholders' equity from December 31, 2007, was predominantly due to the issuance of preferred and common equity securities during 2008. In the fourth quarter of 2008, JPMorgan Chase participated in the Capital Purchase Program and issued preferred stock and a warrant to purchase common stock to the U.S. Treasury, resulting in a $25.0 billion increase to stockholders' equity. Additional preferred stock issuances and a common stock issuance during 2008 increased equity by $19.3 billion. Equity from issuances of stock awards under the Firm's employee stock-based compensation plans, the Bear Stearns merger, and net income for 2008 was more than offset by the declaration of cash dividends and net losses recorded within accumulated other comprehensive income related to AFS securities and defined benefit pension and other postretirement employee benefit plans. For a further discussion, see the Capital Management section that follows, and Note 24 and Note 27 on pages 205–206 and 208, respectively, of this Annual Report.

JPMorgan Chase is involved with several types of off-balance sheet arrangements, including special purpose entities ("SPEs") and lending-related financial instruments (e.g., commitments and guarantees).

Special-purpose entities

The basic SPE structure involves a company selling assets to the SPE. The SPE funds the purchase of those assets by issuing securities to investors in the form of commercial paper, short-term asset-backed notes, medium-term notes and other forms of interest. SPEs are generally structured to insulate investors from claims on the SPE's assets by creditors of other entities, including the creditors of the seller of the assets.

SPEs are an important part of the financial markets, providing market liquidity by facilitating investors' access to specific portfolios of assets and risks. These arrangements are integral to the markets for mortgage-backed securities, commercial paper and other asset-backed securities.

JPMorgan Chase uses SPEs as a source of liquidity for itself and its clients by securitizing financial assets, and by creating investment products for clients. The Firm is involved with SPEs through multi-seller conduits and investor intermediation activities, and as a result of its loan securitizations, through qualifying special purpose entities ("QSPEs"). This discussion focuses mostly on multi-seller conduits and investor intermediation. For a detailed discussion of all SPEs with which the Firm is involved, and the related accounting, see Note 1, Note 16 and Note 17 on pages 134–145, 180–188 and 189–198, respectively of this Annual Report.

The Firm holds capital, as deemed appropriate, against all SPE-related transactions and related exposures, such as derivative transactions and lending-related commitments and guarantees.

The Firm has no commitments to issue its own stock to support any SPE transaction, and its policies require that transactions with SPEs be conducted at arm's length and reflect market pricing. Consistent with this policy, no JPMorgan Chase employee is permitted to invest in SPEs with which the Firm is involved where such investment would violate the Firm's Code of Conduct. These rules prohibit employees from self-dealing and acting on behalf of the Firm in transactions with which they or their family have any significant financial interest.

Implications of a credit rating downgrade to JPMorgan Chase Bank, N.A.
For certain liquidity commitments to SPEs, the Firm could be required to provide funding if the short-term credit rating of JPMorgan Chase Bank, N.A., was downgraded below specific levels, primarily "P-1", "A-1" and "F1" for Moody's, Standard & Poor's and Fitch, respectively. The amount of these liquidity commitments was $61.0 billion and $94.0 billion at December 31, 2008 and 2007, respectively. Alternatively, if JPMorgan Chase Bank, N.A., were downgraded, the Firm could be replaced by another liquidity provider in lieu of providing funding under the liquidity commitment, or in certain circumstances, the Firm could facilitate the sale or refinancing of the assets in the SPE in order to provide liquidity. These commitments are included in other unfunded commitments to extend credit and asset purchase agreements, as shown in the Off-balance sheet lending-related financial instruments and guarantees table on page 81 of this Annual Report.

As noted above, the Firm is involved with three types of SPEs. A summary of each type of SPE follows.

Multi-seller conduits
The Firm helps customers meet their financing needs by providing access to the commercial paper markets through variable interest entities ("VIEs") known as multi-seller conduits. Multi-seller conduit entities are separate bankruptcy-remote entities that purchase interests in, and make loans secured by, pools of receivables and other financial assets pursuant to agreements with customers of the Firm. The conduits fund their purchases and loans through the issuance of highly rated commercial paper to third-party investors. The primary source of repayment of the commercial paper is the cash flow from the pools of assets. JPMorgan Chase receives fees related to the structuring of multi-seller conduit transactions and receives compensation from the multi-seller conduits for its role as administrative agent, liquidity provider, and provider of program-wide credit enhancement.

Investor intermediation
As a financial intermediary, the Firm creates certain types of VIEs and also structures transactions, typically derivative structures, with these VIEs to meet investor needs. The Firm may also provide liquidity and other support. The risks inherent in derivative instruments or liquidity commitments are managed similarly to other credit, market and liquidity risks to which the Firm is exposed. The principal types of VIEs the Firm uses in these structuring activities are municipal bond vehicles, credit-linked note vehicles and collateralized debt obligation vehicles.

Loan securitizations
JPMorgan Chase securitizes and sells a variety of loans, including residential mortgages, credit cards, automobile, student, and commercial loans (primarily related to real estate). JPMorgan Chase-sponsored securitizations utilize SPEs as part of the securitization process. These SPEs are structured to meet the definition of a QSPE (as discussed in Note 1 on page 134 of this Annual Report); accordingly, the assets and liabilities of securitization-related QSPEs are not reflected on the Firm's Consolidated Balance Sheets (except for retained interests, as described below). The primary purpose of these vehicles is to meet investor needs and generate liquidity for the Firm through the sale of loans to the QSPEs. These QSPEs are financed through the issuance of fixed or floating-rate asset-backed securities that are sold to third-party investors or held by the Firm.

Consolidation and consolidation sensitivity analysis on capital
For more information regarding these programs and the Firm's other SPEs, as well as the Firm's consolidation analysis for these programs, see Note 16 and Note 17 on pages 180–188 and 189–198, respectively, of this Annual Report.

Special-purpose entities revenue

The following table summarizes certain revenue information related to consolidated and nonconsolidated VIEs and QSPEs with which the Firm has significant involvement. The revenue reported in the table below primarily represents contractual servicing and credit fee income (i.e., for income from acting as administrator, structurer, liquidity provider). It does not include mark-to-market gains and losses from changes in the fair value of trading positions (such as derivative transactions) entered into with VIEs. Those gains and losses are recorded in principal transactions revenue.

Revenue from VIEs and QSPEs

Year ended December 31, (in millions)	**2008**	2007	2006
VIEs:[a]			
Multi-seller conduits	**$ 314**	$ 187[b]	$ 160
Investor intermediation	**18**	33	49
Total VIEs	**332**	220	209
QSPEs[c]	**1,746**	1,420	1,131
Total	**$ 2,078**	$ 1,640	$ 1,340

(a) Includes revenue associated with consolidated VIEs and significant nonconsolidated VIEs.
(b) Excludes the markdown on subprime CDO assets that was recorded in principal transactions revenue in 2007.
(c) Excludes servicing revenue from loans sold to and securitized by third parties. Prior period amounts have been revised to conform to the current period presentation.

American Securitization Forum subprime adjustable rate mortgage loans modifications

In December 2007, the American Securitization Forum ("ASF") issued the "Streamlined Foreclosure and Loss Avoidance Framework for Securitized Subprime Adjustable Rate Mortgage Loans" ("the Framework"). The Framework provides guidance for servicers to streamline evaluation procedures of borrowers with certain subprime adjustable rate mortgage ("ARM") loans to more efficiently provide modification of such loans with terms that are more appropriate for the individual needs of such borrowers. The Framework applies to all first-lien subprime ARM loans that have a fixed rate of interest for an initial period of 36 months or less; are included in securitized pools; were originated between January 1, 2005, and July 31, 2007; and have an initial interest rate reset date between January 1, 2008, and July 31, 2010. The Framework categorizes the population of ASF Framework Loans into three segments. Segment 1 includes loans where the borrower is current and likely to be able to refinance into any available mortgage product. Segment 2 includes loans where the borrower is current, unlikely to be able to refinance into any readily available mortgage industry product and meets certain defined criteria. Segment 3 includes loans where the borrower is not current, as defined, and does not meet the criteria for Segments 1 or 2. JPMorgan Chase adopted the Framework during the first quarter of 2008. For those AFS Framework Loans serviced by the Firm and owned by Firm-sponsored QSPEs, the Firm modified principal amounts of $1.7 billion of Segment 2 subprime mortgages during the year ended December 31, 2008. The following table presents selected information relating to the principal amount of Segment 3 loans for the year ended December 31, 2008, including those that have been modified, subjected to other loss mitigation activities or have been prepaid by the borrower.

Year ended December 31, 2008 (in millions)	
Loan modifications	$ 2,384
Other loss mitigation activities	865
Prepayments	219

For additional discussion of the Framework, see Note 16 on page 188 of this Annual Report.

Off-balance sheet lending-related financial instruments and guarantees

JPMorgan Chase utilizes lending-related financial instruments (e.g., commitments and guarantees) to meet the financing needs of its customers. The contractual amount of these financial instruments represents the maximum possible credit risk should the counterparty draw upon the commitment or the Firm be required to fulfill its obligation under the guarantee, and the counterparty subsequently fail to perform according to the terms of the contract. These commitments and guarantees historically expire without being drawn and even higher proportions expire without a default. As a result, the total contractual amount of these instruments is not, in the Firm's view, representative of its actual future credit exposure or funding requirements. Further, certain commitments, primarily related to consumer financings, are cancelable, upon notice, at the option of the Firm. For further discussion of lending-related commitments and guarantees and the Firm's accounting for them, see lending-related commitments in Credit Risk Management on page 102 and Note 33 on pages 218–222 of this Annual Report.

Contractual cash obligations

In the normal course of business, the Firm enters into various contractual obligations that may require future cash payments. Commitments for future cash expenditures primarily include contracts to purchase future services and capital expenditures related to real estate–related obligations and equipment.

The accompanying table summarizes, by remaining maturity, JPMorgan Chase's off-balance sheet lending-related financial instruments and significant contractual cash obligations at December 31, 2008. Contractual purchases and capital expenditures in the table below reflect the minimum contractual obligation under legally enforceable contracts with terms that are both fixed and determinable. Excluded from the following table are a number of obligations to be settled in cash, primarily in under one year. These obligations are reflected on the Firm's Consolidated Balance Sheets and include federal funds purchased and securities loaned or sold under repurchase agreements; commercial paper; other borrowed funds; purchases of debt and equity instruments; derivative payables; and certain purchases of instruments that resulted in settlement failures. Also excluded are contingent payments associated with certain acquisitions that could not be estimated. For discussion regarding long-term debt and trust preferred capital debt securities, see Note 23 on pages 203–204 of this Annual Report. For discussion regarding operating leases, see Note 31 on page 213 of this Annual Report.

The following table presents maturity information for off-balance sheet lending-related financial instruments, guarantees and commitments.

Off-balance sheet lending-related financial instruments and guarantees

By remaining maturity at December 31, (in millions)	2008 2009	2010-2011	2012-2013	After 2013	**Total**	2007 Total
Lending-related						
Consumer[a]	**$ 642,978**	**$ 4,098**	**$ 9,916**	**$ 84,515**	**$ 741,507**	$ 815,936
Wholesale:

Obligations under affinity and co-brand programs	**1,174**	**2,086**	**1,999**	**2,879**	**8,138**	5,477
Other liabilities[m]	**666**	**809**	**865**	**2,665**	**5,005**	5,656
Total	**$ 366,891**	**$ 117,889**	**$ 67,367**	**$125,527**	**$ 677,674**	$ 481,021

(a) Includes credit card and home equity lending-related commitments of $623.7 billion and $95.7 billion, respectively, at December 31, 2008; and $714.8 billion and $74.2 billion, respectively, at December 31, 2007. These amounts for credit card and home equity lending-related commitments represent the total available credit for these products. The Firm has not experienced, and does not anticipate, that all available lines of credit for these products will be utilized at the same time. The Firm can reduce or cancel these lines of credit by providing the borrower prior notice or, in some cases, without notice as permitted by law.

(b) Includes unused advised lines of credit totaling $36.3 billion and $38.4 billion at December 31, 2008 and 2007, respectively, which are not legally binding. In regulatory filings with the Federal Reserve, unused advised lines are not reportable. See the Glossary of terms, on page 230 of this Annual Report, for the Firm's definition of advised lines of credit.

(c) Represents contractual amount net of risk participations totaling $28.3 billion at both December 31, 2008 and 2007.

(d) Excludes unfunded commitments to third-party private equity funds of $1.4 billion and $881 million at December 31, 2008 and 2007, respectively. Also excluded unfunded commitments for other equity investments of $1.0 billion and $903 million at December 31, 2008 and 2007, respectively.

(e) Includes commitments to investment and noninvestment grade counterparties in connection with leveraged acquisitions of $3.6 billion and $8.2 billion at December 31, 2008 and 2007, respectively.

(f) Largely represents asset purchase agreements to the Firm's administered multi-seller, asset-backed commercial paper conduits. The maturity is based upon the weighted-average life of the underlying assets in the SPE, which are based upon the remainder of each conduit transaction's committed liquidity plus either the expected weighted average life of the assets should the committed liquidity expire without renewal, or the expected time to sell the underlying assets in the securitization market. It also includes $96 million and $1.1 billion of asset purchase agreements to other third-party entities at December 31, 2008 and 2007, respectively.

(g) JPMorgan Chase held collateral relating to $31.0 billion and $31.5 billion of these arrangements at December 31, 2008 and 2007, respectively. Prior periods have been revised to conform to the current presentation.

(h) Includes unissued standby letters of credit commitments of $39.5 billion and $50.7 billion at December 31, 2008 and 2007, respectively.

(i) Collateral held by the Firm in support of securities lending indemnification agreements was $170.1 billion and $390.5 billion at December 31, 2008 and 2007, respectively. Securities lending collateral comprises primarily cash, securities issued by governments that are members of the Organisation for Economic Co-operation and Development and U.S. government agencies.

(j) Represents notional amounts of derivatives qualifying as guarantees. For further discussion of guarantees, see Note 33 on pages 218–222 of this Annual Report.

(k) Included on the Consolidated Balance Sheets in beneficial interests issued by consolidated variable interest entities.

(l) Includes noncancelable operating leases for premises and equipment used primarily for banking purposes and for energy-related tolling service agreements. Excludes the benefit of noncancelable sublease rentals of $2.3 billion and $1.3 billion at December 31, 2008 and 2007, respectively.

(m) Includes deferred annuity contracts. Excludes the $1.3 billion discretionary contribution to the Firm's U.S. defined benefit pension plan that was made on January 15, 2009 (for further discussion, see Note 9 on pages 161–167), and contributions to the U.S. and non-U.S. other postretirement benefits plans, if any, as these contributions are not reasonably estimable at this time. Also excluded are unrecognized tax benefits of $5.9 billion and $4.8 billion at December 31, 2008 and 2007, respectively, as the timing and amount of future cash payments are not determinable at this time.

CAPITAL MANAGEMENT

The Firm's capital management framework is intended to ensure that there is capital sufficient to support the underlying risks of the Firm's business activities and to maintain "well-capitalized" status under regulatory requirements. In addition, the Firm holds capital above these requirements in amounts deemed appropriate to achieve the Firm's regulatory and debt rating objectives. The process of assigning equity to the lines of business is integrated into the Firm's capital framework and is overseen by the ALCO.

Line of business equity

The Firm's framework for allocating capital is based upon the following objectives:

- integrate firmwide capital management activities with capital management activities within each of the lines of business
- measure performance consistently across all lines of business
- provide comparability with peer firms for each of the lines of business

Equity for a line of business represents the amount the Firm believes the business would require if it were operating independently, incorporating sufficient capital to address economic risk measures, regulatory capital requirements and capital levels for similarly rated peers. Capital is also allocated to each line of business for, among other things, goodwill and other intangibles associated with acquisitions effected by the line of business. Return on common equity is measured and internal targets for expected returns are established as a key measure of a business segment's performance.

Relative to 2007, line of business equity increased during 2008, reflecting growth across the businesses. In addition, at the end of the third quarter of 2008, equity was increased for each line of business in anticipation of the future implementation of the new Basel II capital rules. For further details on these rules, see Basel II on page 84 of this Annual Report. Finally, during 2008, capital allocated to RFS, CS, and CB was increased as a result of the Washington Mutual transaction; capital allocated to AM was increased due to the Bear Stearns merger and the purchase of the additional equity interest in Highbridge; and capital allocated to IB was increased due to the Bear Stearns merger.

In accordance with SFAS 142, the lines of business perform the required goodwill impairment testing. For a further discussion of goodwill and impairment testing, see Critical Accounting Estimates Used by the Firm and Note 18 on pages 119–123 and 198–201, respectively, of this Annual Report.

Line of business equity December 31, (in billions)	**2008**	2007
Investment Bank	**$ 33.0**	$ 21.0
Retail Financial Services	**25.0**	16.0
Card Services	**15.0**	14.1
Commercial Banking	**8.0**	6.7
Treasury & Securities Services	**4.5**	3.0
Asset Management	**7.0**	4.0
Corporate/Private Equity	**42.4**	58.4
Total common stockholders' equity	**$134.9**	$ 123.2

Line of business equity (in billions)	Yearly Average **2008**	2007
Investment Bank	**$ 26.1**	$ 21.0
Retail Financial Services	**19.0**	16.0
Card Services	**14.3**	14.1
Commercial Banking	**7.3**	6.5
Treasury & Securities Services	**3.8**	3.0
Asset Management	**5.6**	3.9
Corporate/Private Equity[(a)]	**53.0**	54.2
Total common stockholders' equity	**$129.1**	$ 118.7

(a) 2008 and 2007 include $41.9 billion and $41.7 billion, respectively, of equity to offset goodwill, and $11.1 billion and $12.5 billion, respectively, of equity, primarily related to Treasury, Private Equity and the Corporate pension plan.

Economic risk capital

JPMorgan Chase assesses its capital adequacy relative to the risks underlying the Firm's business activities, utilizing internal risk-assessment methodologies. The Firm assigns economic capital primarily based upon four risk factors: credit risk, market risk, operational risk and private equity risk. In 2008, the growth in economic risk capital was driven by higher credit risk capital, which was increased primarily due to a combination of higher derivative exposure, a weakening credit environment, and asset growth related to the Bear Stearns and Washington Mutual transactions.

Economic risk capital (in billions)	Yearly Average **2008**	2007
Credit risk	**$ 37.8**	$ 30.0
Market risk	**10.5**	9.5
Operational risk	**6.3**	5.6
Private equity risk	**5.3**	3.7
Economic risk capital	**59.9**	48.8
Goodwill	**46.1**	45.2
Other[(a)]	**23.1**	24.7
Total common stockholders' equity	**$129.1**	$ 118.7

(a) Reflects additional capital required, in the Firm's view, to meet its regulatory and debt rating objectives.

Credit risk capital
Credit risk capital is estimated separately for the wholesale businesses (IB, CB, TSS and AM) and consumer businesses (RFS and CS).

Credit risk capital for the overall wholesale credit portfolio is defined in terms of unexpected credit losses, both from defaults and declines in the portfolio value due to credit deterioration, measured over a one-year period at a confidence level consistent with an "AA" credit rating standard. Unexpected losses are losses in excess of those for which provisions for credit losses are maintained. The capital methodology is based upon several principal drivers of credit risk: exposure at default (or loan-equivalent amount), default likelihood, credit spreads, loss severity and portfolio correlation.

Credit risk capital for the consumer portfolio is based upon product and other relevant risk segmentation. Actual segment level default and severity experience are used to estimate unexpected losses for a one-year horizon at a confidence level consistent with an "AA" credit rating standard. Statistical results for certain segments or portfolios are adjusted to ensure that capital is consistent with external benchmarks, such as subordination levels on market transactions or capital held at representative monoline competitors, where appropriate.

Market risk capital
The Firm calculates market risk capital guided by the principle that capital should reflect the risk of loss in the value of portfolios and financial instruments caused by adverse movements in market variables, such as interest and foreign exchange rates, credit spreads, securities prices and commodities prices. Daily Value-at-Risk ("VaR"), biweekly stress-test results and other factors are used to determine appropriate capital levels. The Firm allocates market risk capital to each business segment according to a formula that weights that segment's VaR and stress-test exposures. See Market Risk Management on pages 111–116 of this Annual Report for more information about these market risk measures.

Operational risk capital
Capital is allocated to the lines of business for operational risk using a risk-based capital allocation methodology which estimates operational risk on a bottom-up basis. The operational risk capital model is based upon actual losses and potential scenario-based stress losses, with adjustments to the capital calculation to reflect changes in the quality of the control environment or the use of risk-transfer products. The Firm believes its model is consistent with the new Basel II Framework.

Private equity risk capital
Capital is allocated to privately and publicly held securities, third-party fund investments and commitments in the private equity portfolio to cover the potential loss associated with a decline in equity markets and related asset devaluations. In addition to negative market fluctuations, potential losses in private equity investment portfolios can be magnified by liquidity risk. The capital allocation for the private equity portfolio is based upon measurement of the loss experience suffered by the Firm and other market participants over a prolonged period of adverse equity market conditions.

Regulatory capital

The Board of Governors of the Federal Reserve System (the "Federal Reserve") establishes capital requirements, including well-capitalized standards for the consolidated financial holding company. The Office of the Comptroller of the Currency ("OCC") establishes similar capital requirements and standards for the Firm's national banks, including JPMorgan Chase Bank, N.A., and Chase Bank USA, N.A.

The Federal Reserve granted the Firm, for a period of 18 months following the Bear Stearns merger, relief up to a certain specified amount and subject to certain conditions from the Federal Reserve's risk-based capital and leverage requirements with respect to Bear Stearns' risk-weighted assets and other exposures acquired. The amount of such relief is subject to reduction by one-sixth each quarter subsequent to the merger and expires on October 1, 2009. The OCC granted JPMorgan Chase Bank, N.A. similar relief from its risk-based capital and leverage requirements.

JPMorgan Chase maintained a well-capitalized position, based upon Tier 1 and Total capital ratios at December 31, 2008 and 2007, as indicated in the tables below. For more information, see Note 30 on pages 212–213 of this Annual Report.

Risk-based capital components and assets

December 31, (in millions)	**2008**	2007
Total Tier 1 capital[(a)]	**$ 136,104**	$ 88,746
Total Tier 2 capital	**48,616**	43,496
Total capital	**$ 184,720**	$ 132,242
Risk-weighted assets	**$ 1,244,659**	$ 1,051,879
Total adjusted average assets	**1,966,895**	1,473,541

(a) The FASB has been deliberating certain amendments to both SFAS 140 and FIN 46R that may impact the accounting for transactions that involve QSPEs and VIEs. Based on the provisions of the current proposal and the Firm's interpretation of the proposal, the Firm estimates that the impact of consolidation could be up to $70 billion of credit card receivables, $40 billion of assets related to Firm-sponsored multi-seller conduits, and $50 billion of other loans (including residential mortgages); the decrease in the Tier 1 capital ratio could be approximately 80 basis points. The ultimate impact could differ significantly due to the FASB's continuing deliberations on the final requirements of the rule and market conditions.

Tier 1 capital was $136.1 billion at December 31, 2008, compared with $88.7 billion at December 31, 2007, an increase of $47.4 billion.

The following table presents the changes in Tier 1 capital for the year ended December 31, 2008.

Tier 1 capital, December 31, 2007 (in millions)	$ 88,746
Net income	5,605
Issuance of cumulative perpetual preferred stock to U.S. Treasury	23,750
Warrant issued to U.S. Treasury in connection with issuance of preferred stock	1,250
Issuance of noncumulative perpetual preferred stock	7,800
Issuance of preferred stock – conversion of Bear Stearns preferred stock	352
Net issuance of common stock	11,485
Net issuance of common stock under employee stock-based compensation plans	3,317
Net issuance of common stock in connection with the Bear Stearns merger	1,198
Dividends declared	(6,307)
Net issuance of qualifying trust preferred capital debt securities	2,619
DVA on structured debt and derivative liabilities	(1,475)
Goodwill and other nonqualifying intangibles (net of deferred tax liabilities)	(1,357)
Other	(879)
Increase in Tier 1 capital	**47,358**
Tier 1 capital, December 31, 2008	**$136,104**

Additional information regarding the Firm's capital ratios and the federal regulatory capital standards to which it is subject, and the capital ratios for the Firm's significant banking subsidiaries at December 31, 2008 and 2007, are presented in Note 30 on pages 212–213 of this Annual Report.

Capital Purchase Program

Pursuant to the Capital Purchase Program, on October 28, 2008, the Firm issued to the U.S. Treasury, for total proceeds of $25.0 billion, (i) 2.5 million shares of Series K Preferred Stock, and (ii) a warrant to purchase up to 88,401,697 shares of the Firm's common stock, at an exercise price of $42.42 per share, subject to certain antidilution and other adjustments. The Series K Preferred Stock qualifies as Tier 1 capital.

The Series K Preferred Stock bears cumulative dividends at a rate of 5% per year for the first five years and 9% per year thereafter. The Series K Preferred Stock ranks equally with the Firm's existing 6.15% Cumulative Preferred Stock, Series E; 5.72% Cumulative Preferred Stock, Series F; 5.49% Cumulative Preferred Stock, Series G; Fixed-to-Floating Rate Noncumulative Perpetual Preferred Stock, Series I; and 8.63% Noncumulative Perpetual Preferred Stock, Series J, in terms of dividend payments and upon liquidation of the Firm.

Any accrued and unpaid dividends on the Series K Preferred Stock must be fully paid before dividends may be declared or paid on stock ranking junior or equally with the Series K Preferred Stock. Pursuant to the Capital Purchase Program, until October 28, 2011, the U.S. Treasury's consent is required for any increase in dividends on the Firm's common stock from the amount of the last quarterly stock dividend declared by the Firm prior to October 14, 2008, unless the Series K Preferred Stock is redeemed in whole before then, or the U.S. Treasury has transferred all of the Series K Preferred Stock it owns to third parties.

The Firm may not repurchase or redeem any common stock or other equity securities of the Firm, or any trust preferred securities issued by the Firm or any of its affiliates, without the prior consent of the U.S. Treasury (other than (i) repurchases of the Series K Preferred Stock and (ii) repurchases of junior preferred shares or common stock in connection with any employee benefit plan in the ordinary course of business consistent with past practice).

Basel II

The minimum risk-based capital requirements adopted by the U.S. federal banking agencies follow the Capital Accord of the Basel Committee on Banking Supervision. In 2004, the Basel Committee published a revision to the Accord ("Basel II"). The goal of the new Basel II Framework is to provide more risk-sensitive regulatory capital calculations and promote enhanced risk management practices among large, internationally active banking organizations. U.S. banking regulators published a final Basel II rule in December 2007, which will require JPMorgan Chase to implement Basel II at the holding company level, as well as at certain of its key U.S. bank subsidiaries.

Prior to full implementation of the new Basel II Framework, JPMorgan Chase will be required to complete a qualification period of four consecutive quarters during which it will need to demonstrate that it meets the requirements of the new rule to the satisfaction of its primary U.S. banking regulators. The U.S. implementation timetable consists of the qualification period, starting any time between April 1, 2008, and April 1, 2010, followed by a minimum transition period of three years. During the transition period, Basel II risk-based capital requirements cannot fall below certain floors based on current ("Basel I") regulations. JPMorgan Chase expects to be in compliance with all relevant Basel II rules within the established timelines. In addition, the Firm has adopted, and will continue to adopt, based upon various established timelines, Basel II in certain non-U.S. jurisdictions, as required.

Broker-dealer regulatory capital

JPMorgan Chase's principal U.S. broker-dealer subsidiaries are J.P. Morgan Securities Inc. ("JPMorgan Securities") and J.P. Morgan Clearing Corp. (formerly known as Bear Stearns Securities Corp.). JPMorgan Securities and J.P. Morgan Clearing Corp. are each subject to Rule 15c3-1 under the Securities Exchange Act of 1934 ("Net Capital Rule"). JPMorgan Securities and J.P. Morgan Clearing Corp. are also registered as futures commission merchants and subject to Rule 1.17 under the Commodity Futures Trading Commission ("CFTC").

JPMorgan Securities and J.P. Morgan Clearing Corp. have elected to compute their minimum net capital requirements in accordance with the "Alternative Net Capital Requirement" of the Net Capital Rule. At December 31, 2008, JPMorgan Securities' net capital, as defined by the Net Capital Rule, of $7.2 billion exceeded the minimum requirement by $6.6 billion. In addition to its net capital requirements, JPMorgan Securities is required to hold tentative net capital in excess

of $1.0 billion and is also required to notify the Securities and Exchange Commission ("SEC") in the event that tentative net capital is less than $5.0 billion in accordance with the market and credit risk standards of Appendix E of the Net Capital Rule. As of December 31, 2008, JPMorgan Securities had tentative net capital in excess of the minimum and the notification requirements. On October 1, 2008, J.P. Morgan Securities Inc. merged with and into Bear, Stearns & Co. Inc., and the surviving entity changed its name to J.P. Morgan Securities Inc.

J.P. Morgan Clearing Corp., a subsidiary of JPMorgan Securities provides clearing and settlement services. At December 31, 2008, J.P. Morgan Clearing Corp.'s net capital, as defined by the Net Capital Rule, of $4.7 billion exceeded the minimum requirement by $3.3 billion.

Dividends

On February 23, 2009, the Board of Directors reduced the Firm's quarterly common stock dividend from $0.38 to $0.05 per share, effective for the dividend payable April 30, 2009, to shareholders of record on April 6, 2009. JPMorgan Chase declared quarterly cash dividends on its common stock in the amount of $0.38 for each quarter of 2008 and the second, third and fourth quarters of 2007, and $0.34 per share for the first quarter of 2007 and for each quarter of 2006.

The Firm's common stock dividend policy reflects JPMorgan Chase's earnings outlook, desired dividend payout ratios, need to maintain an adequate capital level and alternative investment opportunities. The Firm's ability to pay dividends is subject to restrictions. For information regarding such restrictions, see page 84 and Note 24 and Note 29 on pages 205–206 and 211, respectively, of this Annual Report and for additional information regarding the reduction of the dividend, see page 44.

The following table shows the common dividend payout ratio based upon reported net income.

Common dividend payout ratio

Year ended December 31,	**2008**	2007	2006
Common dividend payout ratio	**114%**	34%	34%

Issuance

The Firm issued $6.0 billion and $1.8 billion of noncumulative perpetual preferred stock on April 23, 2008, and August 21, 2008, respectively. Pursuant to the Capital Purchase Program, on October 28, 2008, the Firm issued to the U.S. Treasury $25.0 billion of cumulative preferred stock and a warrant to purchase up to 88,401,697 shares of the Firm's common stock. For additional information regarding preferred stock, see Note 24 on pages 205–206 of this Annual Report.

On September 30, 2008, the Firm issued $11.5 billion, or 284 million shares, of common stock at $40.50 per share. For additional information regarding common stock, see Note 25 on pages 206–207 of this Annual Report.

Stock repurchases

During the year ended December 31, 2008, the Firm did not repurchase any shares of its common stock. During 2007, under the respective stock repurchase programs then in effect, the Firm repurchased 168 million shares for $8.2 billion at an average price per share of $48.60.

The Board of Directors approved in April 2007, a stock repurchase program that authorizes the repurchase of up to $10.0 billion of the Firm's common shares, which superseded an $8.0 billion stock repurchase program approved in 2006. The $10.0 billion authorization includes shares to be repurchased to offset issuances under the Firm's employee stock-based plans. The actual number of shares that may be repurchased is subject to various factors, including market conditions; legal considerations affecting the amount and timing of repurchase activity; the Firm's capital position (taking into account goodwill and intangibles); internal capital generation; and alternative potential investment opportunities. The repurchase program does not include specific price targets or timetables; may be executed through open market purchases or privately negotiated transactions, or utilizing Rule 10b5-1 programs; and may be suspended at any time. A Rule 10b5-1 repurchase plan allows the Firm to repurchase shares during periods when it would not otherwise be repurchasing common stock – for example, during internal trading "black-out periods." All purchases under a Rule 10b5-1 plan must be made according to a predefined plan that is established when the Firm is not aware of material nonpublic information.

As of December 31, 2008, $6.2 billion of authorized repurchase capacity remained under the current stock repurchase program.

For a discussion of restrictions on stock repurchases, see Capital Purchase Program on page 84 and Note 24 on pages 205–206 of this Annual Report.

For additional information regarding repurchases of the Firm's equity securities, see Part II, Item 5, Market for registrant's common equity, related stockholder matters and issuer purchases of equity securities, on page 17 of JPMorgan Chase's 2008 Form 10-K.

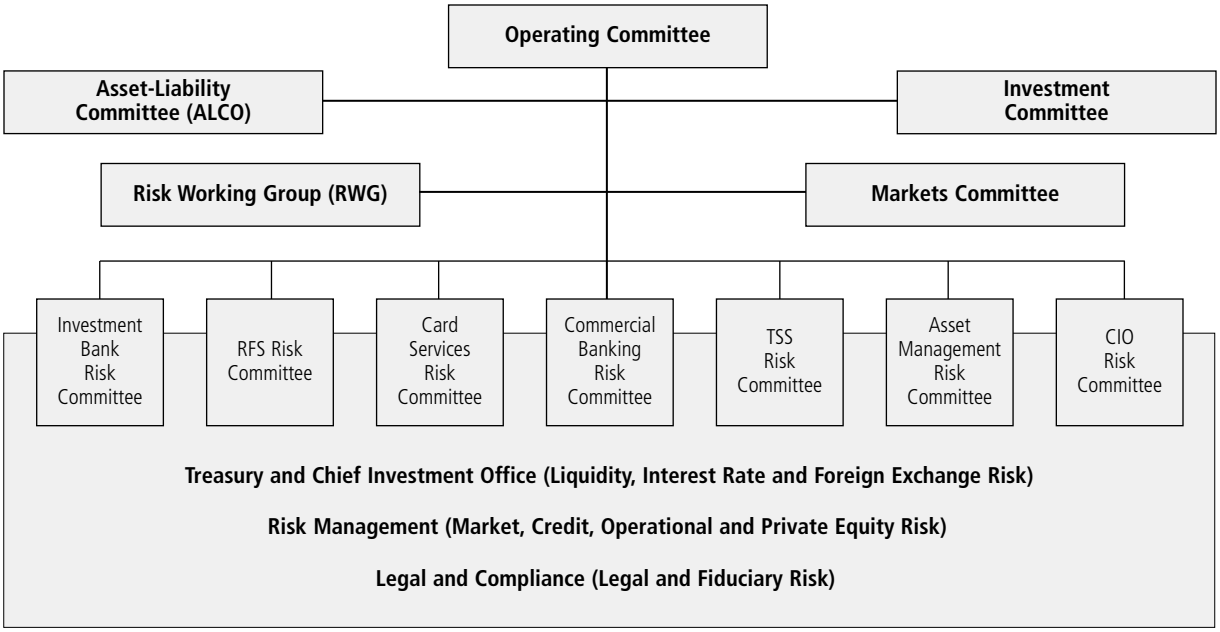
RISK MANAGEMENT

Risk is an inherent part of JPMorgan Chase's business activities. The Firm's risk management framework and governance structure are intended to provide comprehensive controls and ongoing management of the major risks inherent in its business activities. The Firm's ability to properly identify, measure, monitor and report risk is critical to both its soundness and profitability.

- Risk identification: The Firm's exposure to risk through its daily business dealings, including lending, trading and capital markets activities, is identified and aggregated through the Firm's risk management infrastructure. In addition, individuals who manage risk positions, particularly those positions that are complex, are responsible for identifying and estimating potential losses that could arise from specific or unusual events, that may not be captured in other models, and those risks are communicated to senior management.
- Risk measurement: The Firm measures risk using a variety of methodologies, including calculating probable loss, unexpected loss and value-at-risk, and by conducting stress tests and making comparisons to external benchmarks. Measurement models and related assumptions are routinely reviewed with the goal of ensuring that the Firm's risk estimates are reasonable and reflect underlying positions.
- Risk monitoring/control: The Firm's risk management policies and procedures incorporate risk mitigation strategies and include approval limits by customer, product, industry, country and business. These limits are monitored on a daily, weekly and monthly basis, as appropriate.
- Risk reporting: Risk reporting is executed on a line of business and consolidated basis. This information is reported to management on a daily, weekly and monthly basis, as appropriate. There are eight major risk types identified in the business activities of the Firm: liquidity risk, credit risk, market risk, interest rate risk, private equity risk, operational risk, legal and fiduciary risk, and reputation risk.

Risk governance

The Firm's risk governance structure starts with each line of business being responsible for managing its own risks. Each line of business works closely with Risk Management through its own risk committee and, in most cases, its own chief risk officer to manage risk. Each line of business risk committee is responsible for decisions regarding the business' risk strategy, policies and controls.



Overlaying the line of business risk management are four corporate functions with risk management–related responsibilities: Treasury, the Chief Investment Office, Legal and Compliance and Risk Management.

Risk Management is headed by the Firm's Chief Risk Officer, who is a member of the Firm's Operating Committee and who reports to the Chief Executive Officer and the Board of Directors, primarily through the Board's Risk Policy Committee. Risk Management is responsible for providing a firmwide function of risk management and controls. Within Risk Management are units responsible for credit risk, market risk, operational risk and private equity risk, as well as Risk Management Services and Risk Technology and Operations. Risk Management Services is responsible for risk policy and methodology, risk reporting and risk education; and Risk Technology and Operations is responsible for building the information technology infrastructure used to monitor and manage risk.

Treasury and the Chief Investment Office are responsible for measuring, monitoring, reporting and managing the Firm's liquidity, interest rate and foreign exchange risk.

Legal and Compliance has oversight for legal and fiduciary risk.

In addition to the risk committees of the lines of business and the above-referenced corporate functions, the Firm also has an Investment Committee, ALCO and two other risk-related committees, namely, the Risk Working Group and the Markets Committee. The members of these committees are composed of senior management of the Firm, including representatives of line of business, Risk Management, Finance and other senior executives. Members of these risk committees meet frequently to discuss a broad range of topics including, for example, current market conditions and other external events, current risk exposures and concentrations to ensure that the impact of current risk factors are considered broadly across the Firm's businesses.

The Investment Committee oversees global merger and acquisition activities undertaken by JPMorgan Chase for its own account that fall outside the scope of the Firm's private equity and other principal finance activities.

The Asset-Liability Committee is responsible for approving the Firm's liquidity policy, including contingency funding planning and exposure to SPEs (and any required liquidity support by the Firm of such SPEs). The Asset-Liability Committee also oversees the Firm's capital management and funds transfer pricing policy (through which lines of business "transfer" interest and foreign exchange risk to Treasury in the Corporate/Private Equity segment).

The Risk Working Group meets monthly to review issues such as risk policy, risk methodology, Basel II and regulatory issues and topics referred to it by any line of business risk committee. The Markets Committee, chaired by the Chief Risk Officer, meets at least weekly to review and determine appropriate courses of action with respect to significant risk matters, including but not limited to: limits; credit, market and operational risk; large, high risk transactions; and hedging strategies.

The Board of Directors exercises its oversight of risk management, principally through the Board's Risk Policy Committee and Audit Committee. The Risk Policy Committee oversees senior management risk-related responsibilities, including reviewing management policies and performance against these policies and related benchmarks. The Audit Committee is responsible for oversight of guidelines and policies that govern the process by which risk assessment and management is undertaken. In addition, the Audit Committee reviews with management the system of internal controls and financial reporting that is relied upon to provide reasonable assurance of compliance with the Firm's operational risk management processes.

LIQUIDITY RISK MANAGEMENT

The ability to maintain a sufficient level of liquidity is crucial to financial services companies, particularly maintaining appropriate levels of liquidity during periods of adverse conditions. The Firm's funding strategy is to ensure liquidity and diversity of funding sources to meet actual and contingent liabilities through both stable and adverse conditions.

JPMorgan Chase uses a centralized approach for liquidity risk management. Global funding is managed by Corporate Treasury, using regional expertise as appropriate. Management believes that a centralized framework maximizes liquidity access, minimizes funding costs and permits identification and coordination of global liquidity risk.

Recent events

During the second half of 2008, global markets exhibited extraordinary levels of volatility and increasing signs of stress. Throughout this period, access by market participants to the debt, equity, and consumer loan securitization markets was constrained and funding spreads widened sharply. In response to strains in financial markets, U.S. government and regulatory agencies introduced various programs to inject liquidity into the financial system. JPMorgan Chase participated in a number of these programs, two of which were the Capital Purchase Program and the FDIC's TLG Program. On October 28, 2008, JPMorgan Chase issued $25.0 billion of preferred stock as well as a warrant to purchase up to 88,401,697 shares of the Firm's common stock to the U.S. Treasury under the Capital Purchase Program, which enhanced the Firm's capital and liquidity positions. In addition, on December 4, 2008, JPMorgan Chase elected to continue to participate in the FDIC's TLG Program, which facilitated long-term debt issuances at rates (including the guarantee fee charged by the FDIC) more favorable than those for non-FDIC guaranteed debt issuances. Under the TLG Program, the FDIC guarantees certain senior unsecured debt of JPMorgan Chase, and in return for the guarantees, the FDIC is paid a fee based on the amount and maturity of the debt. Under the TLG Program, the FDIC will pay the unpaid principal and interest on an FDIC-guaranteed debt instrument upon the uncured failure of the participating entity to make a timely payment of principal or interest in accordance with the terms of the instrument. During the fourth quarter of 2008, pursuant to the TLG Program, the Firm issued $20.8 billion of bonds guaranteed by the FDIC, further enhancing the Firm's liquidity position. At December 31, 2008, all of the FDIC-guaranteed debt was outstanding and had a carrying value of $21.0 billion, net of hedges. In the interest of promoting deposit stability, during the fourth quarter, the FDIC also (i) temporarily increased, through 2009, insurance coverage on bank deposits to $250,000 per customer from $100,000 per customer, and (ii) for qualified institutions who participated in the TLG Program (such as the Firm), provided full deposit insurance coverage for noninterest-bearing transaction accounts.

During the second half of 2008, the Firm's deposits (excluding those assumed in connection with the Washington Mutual transaction) increased substantially, as the Firm benefited from the heightened volatility and credit concerns affecting the markets.

On May 30, 2008, JPMorgan Chase completed the merger with Bear Stearns. Due to the structure of the transaction and the de-risking of positions over time, the merger with Bear Stearns had no material impact on the Firm's liquidity. On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual from the FDIC. As part of the Washington Mutual transaction, JPMorgan Chase assumed Washington Mutual's deposits as well as its obligations to its credit card securitization-related master trusts, covered bonds, and liabilities to certain Federal Home Loan Banks. The Washington Mutual transaction had an insignificant impact on the Firm's overall liquidity position.

Both S&P and Moody's lowered the Firm's ratings one notch on December 19, 2008 and January 15, 2009, respectively. These rating actions did not have a material impact on the cost or availability of funding to the Firm. For a further discussion of credit ratings, see the Credit Ratings caption of this Liquidity Risk Management section on pages 91–92 of this Annual Report.

Notwithstanding the market events during the latter half of 2008, the Firm's liquidity position remained strong based on its liquidity metrics as of December 31, 2008. The Firm believes that its unsecured and secured funding capacity is sufficient to meet on- and off- balance sheet obligations. JPMorgan Chase's long-dated funding, including core liabilities, exceeded illiquid assets. In addition, during the course of 2008, the Firm raised funds at the parent holding company in excess of its minimum threshold to cover its obligations and those of its nonbank subsidiaries that mature over the next 12 months.

Governance

The Asset-Liability Committee approves and oversees the execution of the Firm's liquidity policy and contingency funding plan. Corporate Treasury formulates the Firm's liquidity and contingency planning strategies and is responsible for measuring, monitoring, reporting and managing the Firm's liquidity risk profile.

Liquidity monitoring

The Firm monitors liquidity trends, tracks historical and prospective on- and off-balance sheet liquidity obligations, identifies and measures internal and external liquidity warning signals to permit early detection of liquidity issues, and manages contingency planning (including identification and testing of various company-specific and market-driven stress scenarios). Various tools, which together contribute to an overall firmwide liquidity perspective, are used to monitor and manage liquidity. Among others, these include: (i) analysis of the timing of liquidity sources versus liquidity uses (i.e., funding gaps) over periods ranging from overnight to one year; (ii) management of debt and capital issuances to ensure that the illiquid portion of the balance sheet can be funded by equity, long-term debt, trust preferred capital debt securities and deposits the Firm believes to be stable; and (iii) assessment of the Firm's capacity to raise incremental unsecured and secured funding.

Liquidity of the parent holding company and its nonbank subsidiaries is monitored independently as well as in conjunction with the liquidity of the Firm's bank subsidiaries. At the parent holding company level, long-term funding is managed to ensure that the parent holding company has, at a minimum, sufficient liquidity to cover its obligations and those of its nonbank subsidiaries within the next 12 months. For bank subsidiaries, the focus of liquidity risk management is on maintenance of unsecured and secured funding capacity sufficient to meet on- and off-balance sheet obligations.

A component of liquidity management is the Firm's contingency funding plan. The goal of the plan is to ensure appropriate liquidity during normal and stress periods. The plan considers various temporary and long-term stress scenarios where access to unsecured funding is severely limited or nonexistent, taking into account both on- and off-balance sheet exposures, and separately evaluates access to funds by the parent holding company and the Firm's banks.

Funding

Sources of funds

The deposits held by the RFS, CB, TSS and AM lines of business are a generally consistent source of funding for JPMorgan Chase Bank, N.A. As of December 31, 2008, total deposits for the Firm were $1.0 trillion, compared with $740.7 billion at December 31, 2007. A significant portion of the Firm's deposits are retail deposits, which are less sensitive to interest rate changes or market volatility and therefore are considered more stable than market-based (i.e., wholesale) liability balances. The Washington Mutual transaction added approximately $159.9 billion of deposits to the Firm, a significant majority of which are retail deposits. In addition, through the normal course of business, the Firm benefits from substantial liability balances originated by RFS, CB, TSS and AM. These franchise-generated liability balances include deposits and funds that are swept to on-balance sheet liabilities (e.g., commercial paper, federal funds purchased and securities loaned or sold under repurchase agreements), a significant portion of which are considered to be stable and consistent sources of funding due to the nature of the businesses from which they are generated. For further discussions of deposit and liability balance trends, see the discussion of the results for the Firm's business segments and the Balance sheet analysis on pages 54–72 and 76–78, respectively, of this Annual Report.

Additional sources of funding include a variety of unsecured short- and long-term instruments, including federal funds purchased, certificates of deposits, time deposits, bank notes, commercial paper, long-term debt, trust preferred capital debt securities, preferred stock and common stock. Secured sources of funding include securities loaned or sold under repurchase agreements, asset securitizations, borrowings from the Federal Reserve (including discount window borrowings, the Primary Dealer Credit Facility and the Term Auction Facility) and borrowings from the Chicago, Pittsburgh and, as a result of the Washington Mutual transaction, the San Francisco Federal Home Loan Banks. However, the Firm does not view borrowings from the Federal Reserve as a primary means of funding the Firm.

Issuance

Funding markets are evaluated on an ongoing basis to achieve an appropriate global balance of unsecured and secured funding at favorable rates. Generating funding from a broad range of sources in a variety of geographic locations enhances financial flexibility and limits dependence on any one source.

During 2008, JPMorgan Chase issued approximately $42.6 billion of long-term debt for funding or capital management purposes, including $20.8 billion of FDIC-guaranteed notes issued under the TLG Program. The Firm also issued $28.0 billion of IB structured notes, the issuances of which are generally client-driven and not for funding or capital management purposes, as the proceeds from such transactions are generally used to purchase securities to mitigate the risk associated with structured note exposure. In addition, during the year, the Firm issued $1.8 billion of trust preferred capital debt securities. During the same period, the Firm redeemed or had maturities of $62.7 billion of securities, including $35.8 billion of IB structured notes.

Preferred stock issuances included $6.0 billion and $1.8 billion of noncumulative perpetual preferred stock issued on April 23 and August 21, 2008, respectively, as well as preferred stock issued to the U.S. Treasury on October 28, 2008, under the Capital Purchase Program. In connection with preferred stock issuance under the Capital Purchase Program, the Firm also issued to the U.S. Treasury on October 28, 2008, a warrant to purchase up to 88,401,697 shares of the Firm's common stock, at an exercise price of $42.42 per share, subject to certain antidilution and other adjustments. The Firm has in the past, and may continue in the future, to repurchase from time to time its debt or trust preferred capital debt securities in open market purchases or privately negotiated transactions subject to regulatory and contractual restrictions.

Finally, during 2008, the Firm securitized $21.4 billion of credit card loans. The ability to securitize loans, and the associated gains on those securitizations, are principally dependent upon the credit quality and other characteristics of the assets securitized as well as upon prevailing market conditions. Given the volatility and stress in the financial markets in the second half of 2008, the Firm did not securitize any residential mortgage loans, auto loans or student loans during 2008.

Replacement Capital Covenants

In connection with the issuance of certain of its trust preferred capital debt securities and noncumulative perpetual preferred stock, the Firm entered into Replacement Capital Covenants ("RCCs") granting certain rights to the holders of "covered debt," as defined in the RCCs, that prohibit the repayment, redemption or purchase of the trust preferred capital debt securities and noncumulative perpetual preferred stock except, with limited exceptions, to the extent that JPMorgan Chase has received, in each such case, specified amounts of proceeds from the sale of certain qualifying securities. Currently the Firm's covered debt is its 5.875% Junior Subordinated Deferrable Interest Debentures, Series O, due in 2035. For more information regarding these covenants, reference is made to the respective RCCs entered into by the Firm in connection with the issuances of such trust preferred capital debt securities and noncumulative perpetual

preferred stock, which are filed with the U.S. Securities and Exchange Commission under cover of Forms 8-K.

Cash flows

For the years ended December 31, 2008, 2007 and 2006, cash and due from banks decreased $13.2 billion, $268 million, and increased $3.7 billion, respectively. The following discussion highlights the major activities and transactions that affected JPMorgan Chase's cash flows during 2008, 2007 and 2006.

Cash Flows from Operating Activities

JPMorgan Chase's operating assets and liabilities support the Firm's capital markets and lending activities, including the origination or purchase of loans initially designated as held-for-sale. The operating assets and liabilities can vary significantly in the normal course of business due to the amount and timing of cash flows, which are affected by client-driven activities, market conditions and trading strategies. Management believes cash flows from operations, available cash balances and the Firm's ability to generate cash through short-and long-term borrowings are sufficient to fund the Firm's operating liquidity needs.

For the year ended December 31, 2008, net cash provided by operating activities was $23.1 billion, while for the years ended December 31, 2007 and 2006, net cash used in operating activities was $110.6 billion and $49.6 billion, respectively. In 2008, net cash generated from operating activities was higher than net income, largely as a result of adjustments for operating items such as the provision for credit losses, depreciation and amortization, stock-based compensation, and certain other expense. During 2006, 2007 and 2008, cash was used to fund loans held-for-sale, primarily in IB and RFS. During 2008, proceeds from sales of loans originated or purchased with an initial intent to sell were slightly higher than cash used to acquire such loans; but the cash flows from these activities were at a significantly lower level than for the same periods in 2007 and 2006 as a result of current market conditions. In 2007 and 2006, cash used to acquire such loans was slightly higher than proceeds from sales.

For the years ended December 31, 2007 and 2006, the net cash used in operating activities supported growth in the Firm's lending and capital markets activities. In 2007, when compared with 2006, there was a significant decline in cash flows from IB loan originations/purchases and sale/securitization activities as a result of the difficult wholesale securitization market and capital markets for leveraged financings, which were affected by a significant deterioration in liquidity in the second half of 2007. Cash flows in 2007 associated with RFS residential mortgage activities grew, reflecting an increase in originations.

Cash Flows from Investing Activities

The Firm's investing activities predominantly include originating loans to be held for investment, other receivables, the available-for-sale investment portfolio and other short-term investment vehicles. For the year ended December 31, 2008, net cash of $286.3 billion was used in investing activities, primarily for: purchases of investment securities in Corporate's AFS portfolio to manage the Firm's exposure to interest rate movements, as well as to make strategic longer-term investments; increased deposits with banks as the result of the availability of excess cash for short-term investment opportunities through interbank lending, and from deposits with the Federal Reserve (which is now an investing activity, reflecting a policy change of the Federal Reserve to pay interest to depository institutions on reserve balances); net additions to the wholesale loan portfolio, from organic growth in CB; additions to the consumer prime mortgage portfolio as a result of the decision to retain, rather than sell, new originations of nonconforming prime mortgage loans; an increase in securities purchased under resale agreements reflecting growth in demand from clients for liquidity; and net purchases of asset-backed commercial paper from money market mutual funds in connection with a temporary Federal Reserve Bank of Boston lending facility. Partially offsetting these uses of cash were proceeds from sales and maturities of AFS securities; loan sales and credit card securitization activities, which were at a lower level than for the same periods in 2007 as a result of the adverse market conditions that have continued since the last half of 2007; and net cash received from acquisitions and the sale of an investment. Additionally, in June 2008, in connection with the merger with Bear Stearns, the Firm sold assets acquired from Bear Stearns to the FRBNY and received cash proceeds of $28.85 billion (for additional information see Note 2 on pages 135–140 of this Annual Report).

For the year ended December 31, 2007, net cash of $73.1 billion was used in investing activities, primarily to fund purchases in the AFS securities portfolio to manage the Firm's exposure to interest rate movements; net additions to the wholesale retained loan portfolios in IB, CB and AM, mainly as a result of business growth; a net increase in the consumer retained loan portfolio, primarily reflecting growth in RFS in home equity loans and net additions to RFS' subprime mortgage loans portfolio (which was affected by management's decision in the third quarter to retain (rather than sell) new subprime mortgages), and growth in prime mortgage loans originated by RFS and AM that cannot be sold to U.S. government agencies or U.S. government-sponsored enterprises; and increases in securities purchased under resale agreements as a result of a higher level of cash that was available for short-term investment opportunities in connection with the Firm's efforts to build liquidity. These net uses of cash were partially offset by cash proceeds received from sales and maturities of AFS securities; and credit card, residential mortgage, student and wholesale loan sales and securitization activities, which grew in 2007 despite the difficult conditions in the credit markets.

For the year ended December 31, 2006, net cash of $99.6 billion was used in investing activities. Net cash was invested to fund net additions to the retained wholesale loan portfolio, mainly resulting from capital markets activity in IB leveraged financings; increases in CS loans reflecting strong organic growth; net additions in retail home equity loans; the acquisition of private-label credit card portfolios from Kohl's, BP and Pier 1 Imports, Inc.; the acquisition of Collegiate Funding Services; and purchases of AFS securities in connection with repositioning the portfolio in response to changes in interest rates. These uses of cash were partially offset by cash proceeds provided from credit card, residential mortgage, auto and

wholesale loan sales and securitization activities; sales and maturities of AFS securities; the net decline in auto loans, which was caused partially by management's decision to de-emphasize vehicle leasing; and the sale of the insurance business at the beginning of the second quarter.

Cash Flows from Financing Activities

The Firm's financing activities primarily reflect cash flows related to customer deposits, issuances of long-term debt and trust preferred capital debt securities, and issuances of preferred and common stock. In 2008, net cash provided by financing activities was $250.5 billion due to: growth in wholesale deposits, in particular, interest- and noninterest-bearing deposits in TSS (driven by both new and existing clients, and due to the deposit inflows related to the heightened volatility and credit concerns affecting the global markets), as well as increases in AM and CB (due to organic growth); proceeds of $25.0 billion from the issuance of preferred stock and a warrant to the U.S. Treasury under the Capital Purchase Program; additional issuances of common stock and preferred stock used for general corporate purposes; an increase in other borrowings due to nonrecourse secured advances from the Federal Reserve Bank of Boston to fund the purchase of asset-backed commercial paper from money market mutual funds; increases in federal funds purchased and securities loaned or sold under repurchase agreements in connection with higher short-term requirements to fulfill client demand for liquidity and finance the Firm's AFS securities inventory; and a net increase in long-term debt due to a combination of non-FDIC guaranteed debt and trust preferred capital debt securities issued prior to December 4, 2008, and the issuance of $20.8 billion of FDIC-guaranteed long-term debt issued during the fourth quarter of 2008. The fourth-quarter FDIC-guaranteed issuance was offset partially by maturities of non-FDIC guaranteed long-term debt during the same period. The increase in long-term debt and trust preferred capital debt securities was used primarily to fund certain illiquid assets held by the parent holding company and build liquidity. Cash was also used to pay dividends on common and preferred stock. The Firm did not repurchase any shares of its common stock in the open market during 2008 in order to maintain its capital objectives.

In 2007, net cash provided by financing activities was $183.0 billion due to a net increase in wholesale deposits from growth in business volumes, in particular, interest-bearing deposits at TSS, AM and CB; net issuances of long-term debt and trust preferred capital debt securities primarily to fund certain illiquid assets held by the parent holding company and build liquidity, and by IB from client-driven structured notes transactions; and growth in commercial paper issuances and other borrowed funds due to growth in the volume of liability balances in sweep accounts in TSS and CB, and to fund trading positions and to further build liquidity. Cash was used to repurchase common stock and pay dividends on common stock, including an increase in the quarterly dividend in the second quarter of 2007.

In 2006, net cash provided by financing activities was $152.7 billion due to net cash received from growth in deposits, reflecting new retail account acquisitions and the ongoing expansion of the retail branch distribution network; higher wholesale business volumes; increases in securities sold under repurchase agreements to fund trading positions and higher AFS securities positions; and net issuances of long-term debt and trust preferred capital debt securities. The net cash provided was offset partially by the payment of cash dividends on stock and common stock repurchases.

Credit ratings

The cost and availability of financing are influenced by credit ratings. Reductions in these ratings could have an adverse effect on the Firm's access to liquidity sources, increase the cost of funds, trigger additional collateral or funding requirements and decrease the number of investors and counterparties willing to lend to the Firm. Additionally, the Firm's funding requirements for VIEs and other third-party commitments may be adversely affected. For additional information on the impact of a credit ratings downgrade on the funding requirements for VIEs, and on derivatives and collateral agreements, see Special-purpose entities on pages 79–80 and Ratings profile of derivative receivables marked to market ("MTM") on page 100 of this Annual Report.

Critical factors in maintaining high credit ratings include a stable and diverse earnings stream, strong capital ratios, strong credit quality and risk management controls, diverse funding sources, and disciplined liquidity monitoring procedures.

The credit ratings of the parent holding company and each of the Firm's significant banking subsidiaries as of January 15, 2009, were as follows.

	Short-term debt			Senior long-term debt		
	Moody's	S&P	Fitch	Moody's	S&P	Fitch
JPMorgan Chase & Co.	P-1	A-1	F1+	Aa3	A+	AA-
JPMorgan Chase Bank, N.A.	P-1	A-1+	F1+	Aa1	AA-	AA-
Chase Bank USA, N.A.	P-1	A-1+	F1+	Aa1	AA-	AA-

On December 19, 2008, S&P lowered the senior long-term debt ratings on JPMorgan Chase & Co. and its principal bank subsidiaries one notch from "AA-" and "AA", respectively; lowered the short-term debt rating of JPMorgan Chase & Co. from "A-1+"; and affirmed the short-term debt ratings of its principal bank subsidiaries. These actions were primarily the result of S&P's belief that the Firm's earnings are likely to decline over the next couple of years in response to increasing loan losses associated with the Firm's exposure to consumer lending, as well as declining business volumes. S&P's current outlook is negative. On January 15, 2009, Moody's lowered the senior long-term debt ratings on JPMorgan Chase & Co. and its principal bank subsidiaries from "Aa2" and "Aaa", respectively. These actions were primarily the result of Moody's view that, in the current economic environment, the Firm may experience difficulties generating capital and could face significant earnings pressure. Moody's affirmed the short-term debt ratings of JPMorgan Chase & Co. and its principal bank subsidiaries at "P-1". Moody's also revised the outlook to stable from negative due to the Firm's strong capital ratios, significant loan loss reserves, and strong franchise. Ratings from Fitch on JPMorgan Chase & Co. and its principal bank subsidiaries remained unchanged from December 31, 2007, and Fitch's outlook remained stable. The recent rating actions by S&P and Moody's did not have a material impact on the cost or availability of the Firm's funding. If the Firm's senior long-term debt ratings were downgraded by one additional notch, the Firm believes the incremental cost of funds or loss of funding would be manageable within the context of current market conditions and the Firm's liquidity resources. JPMorgan Chase's unsecured debt, other than in certain cases IB structured notes, does not contain requirements that would call for an acceleration of payments, maturities or changes in the structure of the existing debt, nor contain collateral provisions or the creation of an additional financial obligation, based on unfavorable changes in the Firm's credit ratings, financial ratios, earnings, cash flows or stock price. To the extent any IB structured notes do contain such provisions, the Firm believes that, in the event of an acceleration of payments or maturities or provision of collateral, the securities used by the Firm to risk manage such structured notes, together with other liquidity resources, are expected to generate funds sufficient to satisfy the Firm's obligations.

CREDIT RISK MANAGEMENT

Credit risk is the risk of loss from obligor or counterparty default. The Firm provides credit (for example, through loans, lending-related commitments and derivatives) to a variety of customers, from large corporate and institutional clients to the individual consumer. For the wholesale business, credit risk management includes the distribution of syndicated loans originated by the Firm into the marketplace (primarily to IB clients), with exposure held in the retained portfolio averaging less than 10% of the total originated loans. Wholesale loans generated by CB and AM are generally retained on the balance sheet. With regard to the consumer credit market, the Firm focuses on creating a portfolio that is diversified from both a product and a geographic perspective. Loss mitigation strategies are being employed for all home lending portfolios. These strategies include rate reductions, principal forgiveness, forbearance and other actions intended to minimize the economic loss and avoid foreclosure. In the mortgage business, originated loans are either retained in the mortgage portfolio or securitized and sold to U.S. government agencies and U.S. government-sponsored enterprises.

Credit risk organization

Credit risk management is overseen by the Chief Risk Officer and implemented within the lines of business. The Firm's credit risk management governance consists of the following functions:

- establishing a comprehensive credit risk policy framework
- monitoring and managing credit risk across all portfolio segments, including transaction and line approval
- assigning and managing credit authorities in connection with the approval of all credit exposure
- managing criticized exposures
- calculating the allowance for credit losses and ensuring appropriate credit risk-based capital management

Risk identification

The Firm is exposed to credit risk through lending and capital markets activities. The credit risk management organization works in partnership with the business segments in identifying and aggregating exposures across all lines of business.

Risk measurement

To measure credit risk, the Firm employs several methodologies for estimating the likelihood of obligor or counterparty default. Methodologies for measuring credit risk vary depending on several factors, including type of asset (e.g., consumer installment versus wholesale loan), risk measurement parameters (e.g., delinquency status and credit bureau score versus wholesale risk rating) and risk management and collection processes (e.g., retail collection center versus centrally managed workout groups). Credit risk measurement is based upon the amount of exposure should the obligor or the counterparty default, the probability of default and the loss severity given a default event. Based upon these factors and related market-based inputs, the Firm estimates both probable and unexpected losses for the wholesale and consumer portfolios. Probable losses, reflected in the provision for credit losses, are based primarily upon statistical estimates of credit losses as a result of obligor or counterparty default. However, probable losses are not the sole indicators of risk. If losses were entirely predictable, the probable loss rate could be factored into pricing and covered as a normal and recurring cost of doing business. Unexpected losses, reflected in the allocation of credit risk capital, represent the potential volatility of actual losses relative to the probable level of losses. Risk measurement for the wholesale portfolio is assessed primarily on a risk-rated basis; for the consumer portfolio, it is assessed primarily on a credit-scored basis.

Risk-rated exposure

For portfolios that are risk-rated (generally held in IB, CB, TSS and AM), probable and unexpected loss calculations are based upon estimates of probability of default and loss given default. Probability of default is the expected default calculated on an obligor basis. Loss given default is an estimate of losses given a default event and takes into consideration collateral and structural support for each credit facility. Calculations and assumptions are based upon management information systems and methodologies which are under continual review. Risk ratings are assigned to differentiate risk within the portfolio and are reviewed on an ongoing basis by credit risk management and revised, if needed, to reflect the borrowers' current risk profiles and the related collateral and structural positions.

Credit-scored exposure

For credit-scored portfolios (generally held in RFS and CS), probable loss is based upon a statistical analysis of inherent losses over discrete periods of time. Probable losses are estimated using sophisticated portfolio modeling, credit scoring and decision-support tools to project credit risks and establish underwriting standards. In addition, common measures of credit quality derived from historical loss experience are used to predict consumer losses. Other risk characteristics evaluated include recent loss experience in the portfolios, changes in origination sources, portfolio seasoning, loss severity and underlying credit practices, including charge-off policies. These analyses are applied to the Firm's current portfolios in order to estimate delinquencies and severity of losses, which determine the amount of probable losses. These factors and analyses are updated at least on a quarterly basis or more frequently as market conditions dictate.

Risk monitoring

The Firm has developed policies and practices that are designed to preserve the independence and integrity of the approval and decision making of extending credit and are intended to ensure credit risks are assessed accurately, approved properly, monitored regularly and managed actively at both the transaction and portfolio levels. The policy framework establishes credit approval authorities, concentration limits, risk-rating methodologies, portfolio review parameters and guidelines for management of distressed exposure. Wholesale credit risk is monitored regularly on both an aggregate portfolio level and on an individual customer basis. Management of the Firm's wholesale exposure is accomplished through a number of means including loan syndication and participations, loan sales, securitizations, credit derivatives, use of master netting agreements and collateral and other risk-reduction techniques, which are further discussed in the following risk sections. For consumer credit risk, the key focus items are trends and concentrations at the portfolio level, whereby potential problems can be remedied through changes in underwriting policies and portfolio guidelines. Consumer Credit Risk Management monitors trends against business expectations and industry benchmarks.

Risk reporting

To enable monitoring of credit risk and decision-making, aggregate credit exposure, credit quality forecasts, concentrations levels and risk profile changes are reported regularly to senior credit risk management. Detailed portfolio reporting of industry, customer and geographic concentrations occurs monthly, and the appropriateness of the allowance for credit losses is reviewed by senior management at least on a quarterly basis. Through the risk reporting and governance structure, credit risk trends and limit exceptions are provided regularly to, and discussed with, senior management, for further information, see page 86 of this Annual Report.

2008 Credit risk overview

During 2008, credit markets experienced deterioration and increased defaults and downgrades reflecting, among other things, reduced liquidity. The liquidity and credit crisis has adversely affected many financial institutions, resulting in the failure of some in both the U.S. and Europe, and has impacted the functioning of credit markets, particularly, the loan syndication and asset-backed securitization markets. The Firm's credit portfolio was affected by these market conditions and experienced deteriorating credit quality, especially in the latter part of the year, generally consistent with the market. In 2008, for the wholesale portfolio, criticized assets and NPAs increased, from historical lows, 301% and 525%, respectively, from the previous year. Charge-offs, which typically lag other portfolio deterioration, have increased from historical lows by 458% over 2007. The Firm has remained focused on aggressively managing the portfolio, including ongoing, in-depth reviews of credit quality, as well as of revisions of industry, product and client concentrations. Risk levels are adjusted as needed to reflect the Firm's risk tolerance. Underwriting standards across all areas of lending have been strengthened, consistent with evolving market conditions in order to permit the Firm to lend in a safe and prudent manner. In light of the current market conditions, the wholesale allowance for loan loss coverage ratio has been strengthened to 2.64%, from 1.67% at the end of 2007.

Consumer portfolio credit performance continues to be negatively affected by the economic environment, particularly the weak labor market and the decline in housing prices which occurred nationally. As a result, the Firm took actions throughout the year to reduce risk exposure by tightening underwriting and loan qualification standards in those markets most affected by the housing downturn. In the fourth quarter of 2008, the Firm announced plans to significantly expand loss mitigation efforts related to its mortgage and home equity portfolios. During the implementation period of these expanded loss mitigation efforts, which was substantially in place in early 2009, the Firm did not place loans into foreclosure. These loss mitigation efforts are expected to result in additional increases in the balance of modified loans carried on the Firm's balance sheet, including loans accounted for as troubled debt restructurings, while minimizing the economic loss to the Firm and assisting homeowners to remain in their homes.

More detailed discussion of the domestic consumer credit environment can be found on pages 103–108 of this Annual Report.

CREDIT PORTFOLIO

The following table presents JPMorgan Chase's credit portfolio as of December 31, 2008 and 2007. Total credit exposure at December 31, 2008, increased $198.8 billion from December 31, 2007, reflecting an increase of $115.0 billion in the consumer credit portfolio and $83.8 billion in the wholesale credit portfolio. The increase in total credit exposure from the prior year reflects $319.2 billion and $54.3 billion of additional credit exposure acquired in connection with the Washington Mutual and Bear Stearns transactions, respectively. The exposure from the Washington Mutual transaction consisted of $271.7 billion in the consumer portfolio and $47.5 billion in the wholesale portfolio, which was primarily commercial lending. The exposure from the Bear Stearns acquisition was included in the wholesale portfolio. Excluding these two transactions, there was a decrease of $174.7 billion in overall credit exposure, which was largely driven by decreases in lending-related commitments, partly offset by increases in derivative receivables and managed loans.

While overall portfolio exposure declined when excluding the Washington Mutual and Bear Stearns transactions, the Firm provided over $150 billion in new loans and lines of credit to retail and wholesale clients in the fourth quarter of 2008, including individual consumers, small businesses, large corporations, not-for-profit organizations, states and municipalities, and other financial institutions.

In the table below, reported loans include loans accounted for at fair value and loans held-for-sale, which are carried at lower of cost or fair value, with changes in value recorded in noninterest revenue. However, these held-for-sale loans and loans accounted for at fair value are excluded from the average loan balances used for the net charge-off rate calculations.

Total credit portfolio

(a) Loans (other than those for which the SFAS 159 fair value option has been elected) are presented net of unearned income and net deferred loan fees of $694 million and $1.0 billion at December 31, 2008 and 2007, respectively.
(b) Represents securitized credit card receivables. For further discussion of credit card securitizations, see Card Services on pages 63–65 of this Annual Report.
(c) Primarily represents margin loans to prime and retail brokerage customers included in accrued interest and accounts receivable on the Consolidated Balance Sheets.
(d) Includes credit card and home equity lending-related commitments of $623.7 billion and $95.7 billion, respectively, at December 31, 2008, and $714.8 billion and $74.2 billion, respectively, at December 31, 2007. These amounts for credit card and home equity lending-related commitments represent the total available credit for these products. The Firm has not experienced, nor does it anticipate, all available lines of credit being used at the same time. The Firm can reduce or cancel these lines of credit by providing the borrower prior notice or, in some cases, without notice as permitted by law.
(e) Includes unused advised lines of credit totaling $36.3 billion and $38.4 billion at December 31, 2008 and 2007, respectively, which are not legally binding. In regulatory filings with the Federal Reserve, unused advised lines are not reportable. See the Glossary of Terms on page 230 of this Annual Report for the Firm's definition of advised lines of credit.
(f) Represents the net notional amount of protection purchased and sold of single-name and portfolio credit derivatives used to manage the credit exposures; these derivatives do not qualify for hedge accounting under SFAS 133. For additional information, see page 101 of this Annual Report.
(g) Represents other liquid securities collateral held by the Firm as of December 31, 2008 and 2007, respectively.
(h) Excludes nonperforming assets related to (1) loans eligible for repurchase as well as loans repurchased from GNMA pools that are insured by U.S. government agencies of $3.3 billion and $1.5 billion at December 31, 2008, and 2007, respectively, and (2) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program, of $437 million and $417 million at December 31, 2008 and 2007, respectively. These amounts for GNMA and student loans are excluded, as reimbursement is proceeding normally.
(i) During the second quarter of 2008, the policy for classifying subprime mortgage and home equity loans as nonperforming was changed to conform to all other home lending products. Amounts for 2007 have been revised to reflect this change.
(j) Excludes home lending purchased credit-impaired home loans accounted for under SOP 03-3 that were acquired as part of the Washington Mutual transaction. These loans are accounted for on a pool basis and the pools are considered to be performing under SOP 03-3. Also excludes loans held-for-sale and loans at fair value.
(k) Includes $1.5 billion of assets acquired in the Washington Mutual transaction.

WHOLESALE CREDIT PORTFOLIO

As of December 31, 2008, wholesale exposure (IB, CB, TSS and AM) increased $83.8 billion from December 31, 2007, primarily due to the Bear Stearns merger, which added $54.3 billion of wholesale exposure in the second quarter of 2008 ($26.0 billion of receivables from customers, $18.9 billion of derivative receivables, $5.0 billion of lending-related commitments and $4.4 billion of loans) and the Washington Mutual transaction (which added $47.5 billion of wholesale exposure in the third quarter of 2008, mainly consisting of loans). Excluding these two transactions, the portfolio decreased $18.0 billion, largely driven by decreases of $73.7 billion in lending-related commitments and $9.9 billion in receivables from customers. Partly offsetting these decreases was an increase of $65.5 billion in derivative receivables. The decrease in lending-related commitments was largely related to a reduction in multi-seller conduit-related commitments. The increase in derivative receivables was primarily related to the decline in interest rates, widening credit spreads and volatile foreign exchange rates reflected in interest rate, credit and foreign exchange derivatives, respectively. For additional information regarding conduit-related commitments, see Note 17 on pages 189–198 of this Annual Report.

Excluding the Washington Mutual and Bear Stearns transactions, retained loans increased $11.0 billion reflecting increases in traditional lending activity while loans held-for-sale and loans at fair value decreased reflecting sales, reduced carrying values and lower volumes in the syndication market.

Wholesale

As of or for the year ended December 31, (in millions)	Credit exposure		Nonperforming loans[f]		90 days past due and accruing	
	2008	2007	**2008**	2007	**2008**	2007

Credit derivative hedges notional[d]	**$ (91,451)**	$ (67,999)	**$ —**	$ (3)	**NA**	NA
Collateral held against derivatives[e]	**(19,816)**	(9,824)	**NA**	NA	**NA**	NA

(a) Includes $224 million of purchased credit-impaired loans at December 31, 2008, which are accounted for in accordance with SOP 03-3. They are considered nonperforming loans because the timing and amount of expected future cash flows is not reasonably estimable. For additional information, see Note 14 on pages 175–178 of this Annual Report.
(b) Primarily represents margin loans to prime and retail brokerage customers, which are included in accrued interest and accounts receivable on the Consolidated Balance Sheets.
(c) Includes unused advised lines of credit totaling $36.3 billion and $38.4 billion at December 31, 2008 and 2007, respectively, which are not legally binding. In regulatory filings with the Federal Reserve, unused advised lines are not reportable.
(d) Represents the net notional amount of protection purchased and sold of single-name and portfolio credit derivatives used to manage the credit exposures; these derivatives do not qualify for hedge accounting under SFAS 133. For additional information, see page 101 of this Annual Report.
(e) Represents other liquid securities collateral held by the Firm as of December 31, 2008 and 2007, respectively.
(f) Assets acquired in loan satisfactions have been excluded in this presentation. See the wholesale nonperforming assets by line of business segment table for additional information.

The following table presents net charge-offs (excluding gains from sales of nonperforming loans), for the years ended December 31, 2008 and 2007.

Net charge-offs

Wholesale

Year ended December 31, (in millions, except ratios)	**2008**	2007
Loans – reported		
Net charge-offs	**$ 402**	$ 72
Average annual net charge-off rate[a]	**0.18%**	0.04%

(a) Excludes average wholesale loans held-for-sale and loans at fair value of $18.9 billion and $18.6 billion for the years ended December 31, 2008 and 2007, respectively.

The following table presents the change in the wholesale nonperforming loan portfolio for the years ended December 31, 2008 and 2007.

Nonperforming loan activity

Wholesale

Year ended December 31, (in millions)	**2008**	2007
Beginning balance	**$ 514**	$ 391
Additions	**3,381**	1,107
Reductions:		
Paydowns and other	**859**	576
Charge-offs	**521**	185
Returned to performing	**93**	136
Sales	**40**	87
Total reductions	**1,513**	984
Net additions	**1,868**	123
Ending balance	**$ 2,382**	$ 514

The following table presents the wholesale nonperforming assets by business segment as of December 31, 2008 and 2007.

	2008				2007			
		Assets acquired in loan satisfactions				Assets acquired in loan satisfactions		
As of December 31, (in millions)	Nonperforming loans	Real estate owned	Other	Nonperforming assets	Nonperforming loans	Real estate owned	Other	Nonperforming assets
Investment Bank	**$ 1,175**	**$ 247**	**$ 1,079**[a]	**$ 2,501**	$ 353	$ 67	$ 33[a]	$ 453
Commercial Banking	**1,026**	**102**	**14**	**1,142**	146	2	—	148

Total	**$ 2,382**	**$ 349**	**$ 1,118**	**$ 3,849**	$ 514	$ 69	$ 33	$ 616

(a) Includes derivative receivables of $1.1 billion and $29 million as of December 31, 2008 and 2007, respectively.

The following table presents summaries of the maturity and ratings profiles of the wholesale portfolio as of December 31, 2008 and 2007. The increase in the proportion of loans maturing after five years was predominantly due to the Washington Mutual transaction. The ratings scale is based upon the Firm's internal risk ratings and generally correspond to the ratings as defined by S&P and Moody's.

Wholesale credit exposure – maturity and ratings profile

	Maturity profile[c]				Ratings profile			
December 31, 2008 (in billions, except ratios)	Due in 1 year or less	Due after 1 year through 5 years	Due after 5 years	Total	Investment-grade ("IG") AAA/Aaa to BBB-/Baa3	Noninvestment-grade BB+/Ba1 & below	Total	Total % of IG
Loans	**32%**	**43%**	**25%**	**100%**	**$ 161**	**$ 87**	**$ 248**	**65%**
Derivative receivables	**31**	**36**	**33**	**100**	**127**	**36**	**163**	**78**
Lending-related commitments	**37**	**59**	**4**	**100**	**317**	**63**	**380**	**83**
Total excluding loans held-for-sale and loans at fair value	**34%**	**50%**	**16%**	**100%**	**$ 605**	**$ 186**	**791**	**77%**
Loans held-for-sale and loans at fair value[a]							**14**	
Receivables from customers							**16**	
Total exposure							**$ 821**	
Net credit derivative hedges notional[b]	**47%**	**47%**	**6%**	**100%**	**$ (82)**	**$ (9)**	**$ (91)**	**90%**

	Maturity profile[c]				Ratings profile			
December 31, 2007 (in billions, except ratios)	Due in 1 year or less	Due after 1 year through 5 years	Due after 5 years	Total	Investment-grade ("IG") AAA/Aaa to BBB-/Baa3	Noninvestment-grade BB+/Ba1 & below	Total	Total % of IG
Loans	44%	45%	11%	100%	$ 127	$ 62	$ 189	67%
Derivative receivables	17	39	44	100	64	13	77	83
Lending-related commitments	35	59	6	100	380	67	447	85
Total excluding loans held-for-sale and loans at fair value	36%	53%	11%	100%	$ 571	$ 142	713	80%
Loans held-for-sale and loans at fair value[a]							24	
Total exposure							$ 737	
Net credit derivative hedges notional[b]	39%	56%	5%	100%	$ (68)	$ —	$ (68)	100%

(a) Loans held-for-sale and loans at fair value relate primarily to syndicated loans and loans transferred from the retained portfolio.
(b) Represents the net notional amounts of protection purchased and sold of single-name and portfolio credit derivatives used to manage the credit exposures; these derivatives do not qualify for hedge accounting under SFAS 133.
(c) The maturity profile of loans and lending-related commitments is based upon the remaining contractual maturity. The maturity profile of derivative receivables is based upon the maturity profile of average exposure. See page 99 of this Annual Report for a further discussion of average exposure.

Wholesale credit exposure – selected industry concentration

The Firm focuses on the management and diversification of its industry concentrations, with particular attention paid to industries with actual or potential credit concerns. At December 31, 2008, the top 15 industries to which the Firm is exposed remained largely unchanged from December 31, 2007. The Firm's real estate industry exposure increased from the prior year due to the Washington Mutual transaction. Customer receivables of $16.1 billion in the table below represents primarily margin loans to prime and retail brokerage clients acquired in the Bear Stearns merger. These margin loans are generally fully collateralized by cash or highly liquid securities to satisfy daily minimum collateral requirements. For additional information on industry concentrations, see Note 34 on pages 222–223 of this Annual Report.

Subtotal	$ 713,215	80%	$ 134,983	$ 6,838	$ 72	$ (67,999)	$ (9,824)
Loans held-for-sale and loans at fair value[c]	23,649						
Receivables from customers	—						
Total	$ 736,864						

(a) Rankings are based upon exposure at December 31, 2008. The industries presented in 2007 table reflect the rankings in the 2008 table.
(b) For more information on exposures to SPEs included in all other, see Note 17 on pages 189–198 of this Annual Report.
(c) Loans held-for-sale and loans at fair value relate primarily to syndicated loans and loans transferred from the retained portfolio.
(d) Credit exposure is net of risk participations and excludes the benefit of credit derivative hedges and collateral held against derivative receivables or loans.
(e) Represents the net notional amounts of protection purchased and sold of single-name and portfolio credit derivatives used to manage the credit exposures; these derivatives do not qualify for hedge accounting under SFAS 133.
(f) Represents other liquid securities collateral held by the Firm as of December 31, 2008 and 2007, respectively.

Wholesale criticized exposure

Exposures deemed criticized generally represent a ratings profile similar to a rating of "CCC+"/"Caa1" and lower, as defined by S&P and Moody's. The total criticized component of the portfolio, excluding loans held-for-sale and loans at fair value, increased to $26.0 billion at December 31, 2008, from $6.8 billion at year-end 2007. The increase was driven primarily by downgrades in the wholesale portfolio.

Industry concentrations for wholesale criticized exposure as of December 31, 2008 and 2007, were as follows.

	2008		2007	
December 31, (in millions, except ratios)	Credit exposure	% of portfolio	Credit exposure	% of portfolio
Exposure by industry[a]				
Real estate	**$ 7,737**	**30%**	$ 1,070	16%
Banks and finance companies	**2,849**	**11**	498	7
Automotive	**1,775**	**7**	1,338	20
Media	**1,674**	**6**	303	4
Building materials/construction	**1,363**	**5**	345	5
Retail and consumer services	**1,311**	**5**	550	8
State and municipal government	**847**	**3**	12	—
Asset managers	**819**	**3**	212	3
Consumer products	**792**	**3**	239	4
Agriculture/paper manufacturing	**726**	**3**	138	2
Insurance	**712**	**3**	17	—
Chemicals/plastics	**591**	**2**	288	4
Healthcare	**436**	**2**	246	4
Transportation	**319**	**1**	74	1
Metals/mining	**262**	**1**	111	2
All other	**3,784**	**15**	1,397	20
Total excluding loans held-for-sale and loans at fair value	**$25,997**	**100%**	$ 6,838	100%
Loans held-for-sale and loans at fair value[b]	**2,258**		205	
Receivables from customers	**—**		—	
Total	**$28,255**		$ 7,043	

(a) Rankings are based upon exposure at December 31, 2008. The industries presented in the 2007 table reflect the rankings in the 2008 table.
(b) Loans held-for-sale and loans at fair value relate primarily to syndicated loans and loans transferred from the retained portfolio.

Presented below is a discussion of several industries to which the Firm has significant exposure, as well as industries the Firm continues to monitor because of actual or potential credit concerns. For additional information, refer to the tables above and on the preceding page.

- Real estate: Exposure to this industry grew in 2008 due to the Washington Mutual transaction, with approximately 70% of this increase consisting of exposure to multi-family lending. Approximately 45% of the real estate exposure is to large real estate companies and institutions (e.g. REITS), professional real estate developers, owners, or service providers, and generally involves real estate leased to third-party tenants. Commercial construction and development accounted for approximately 13% of the real estate portfolio at 2008 year-end. Exposure to national and regional single family homebuilders decreased 31% from 2007 and represented 5% of the portfolio at 2008 year-end. The increase in criticized exposure was largely a result of downgrades to select names within the portfolio, primarily in IB, reflecting the weakening credit environment. The remaining increase in criticized exposure reflected exposures acquired in the Washington Mutual transaction.

- Banks and finance companies: Exposure to this industry increased primarily as a result of higher derivative exposure to commercial banks due to higher volatility and greater trade volume and to the addition of derivative positions from the Bear Stearns merger. The percentage of the portfolio that is investment grade has declined slightly from 2007 as a result of the impact of the weakening credit environment on financial counterparties. The growth in criticized exposure was primarily a result of downgrades to specialty finance companies, reflected in loans and lending-related commitments.

- Automotive: Industry conditions deteriorated significantly in 2008, particularly in North America, and are expected to remain under pressure in 2009. The largest percentage of the Firm's wholesale criticized exposure in this segment is related to Original Equipment Manufacturers. However, a majority of the year-over-year increase in criticized exposure related to automotive suppliers which were negatively affected by significant declines in automotive production. Most of the Firm's criticized exposure in this segment remains performing and is substantially secured.

- Asset Managers: Exposure in this industry grew from 2007 as a result of increased derivative exposure to primarily investment grade funds and the acquisition of loans and lending-related commitments to this industry due to the Bear Stearns merger.

- All other: All other in the wholesale credit exposure concentration table on page 97 of this Annual Report at December 31, 2008 included $278.1 billion of credit exposure to 17 industry segments. Exposures related to SPEs and high-net-worth individuals were 37% and 19%, respectively, of this category. SPEs provide secured financing (generally backed by receivables, loans or

bonds on a bankruptcy-remote, nonrecourse or limited-recourse basis) originated by a diverse group of companies in industries that are not highly correlated. For further discussion of SPEs, see Note 17 on pages 189–198 of this Annual Report. The remaining all other exposure is well-diversified across industries and none comprise more than 2% of total exposure.

Derivative contracts

In the normal course of business, the Firm uses derivative instruments to meet the needs of customers; generate revenue through trading activities; manage exposure to fluctuations in interest rates, currencies and other markets; and manage the Firm's credit exposure. The notional amount of the Firm's derivative contracts outstanding significantly exceeded, in the Firm's view, the possible credit losses that could arise from such transactions. For most derivative transactions, the notional amount does not change hands; it is used simply as a reference to calculate payments. For further discussion of these contracts, see Note 32 and Note 34 on pages 214–217 and 222–223 of this Annual Report.

The following tables summarize the aggregate notional amounts and the net derivative receivables MTM for the periods presented.

Notional amounts of derivative contracts

December 31, (in billions)	Notional amounts[a] 2008	2007
Interest rate contracts		
Interest rate and currency swaps[b]	**$ 56,206**	$ 53,458
Future and forwards	**6,277**	4,548
Written options[c]	**4,803**	5,742
Purchased options	**4,656**	5,349
Total interest rate contracts	**71,942**	69,097
Credit derivatives	**8,388**	7,967
Foreign exchange contracts		
Future and forwards	**3,354**	3,424
Foreign exchange spot contracts	**389**	40
Written options[c]	**972**	909
Purchased options	**959**	906
Total foreign exchange contracts	**5,674**	5,279
Commodity contracts		
Swaps	**234**	275
Future and forwards	**115**	91
Written options[c]	**206**	228
Purchased options	**198**	233
Total commodity contracts	**753**	827
Equity contracts		
Swaps	**77**	105
Future and forwards	**56**	72
Written options[c]	**628**	739
Purchased options	**652**	821
Total equity contracts	**1,413**	1,737
Total derivative notional amounts	**$ 88,170**	$ 84,907

(a) Represents the sum of gross long and gross short third-party notional derivative contracts.
(b) Includes cross currency swap contract notional amounts of $1.7 trillion and $1.4 trillion at December 31, 2008 and 2007, respectively.
(c) Written options do not result in counterparty credit risk.

Derivative receivables marked to market ("MTM")

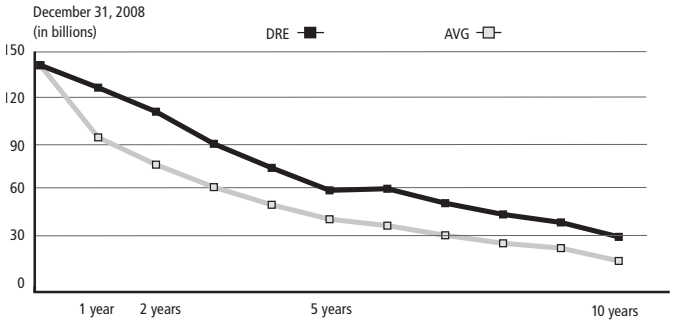
December 31, (in millions)	Derivative receivables MTM 2008	2007
Interest rate contracts	**$ 64,101**	$ 36,020
Credit derivatives	**44,695**	22,083
Foreign exchange contracts	**24,715**	5,616
Commodity contracts	**14,830**	9,419
Equity contracts	**14,285**	3,998
Total, net of cash collateral	**162,626**	77,136
Liquid securities collateral held against derivative receivables	**(19,816)**	(9,824)
Total, net of all collateral	**$ 142,810**	$ 67,312

The amount of derivative receivables reported on the Consolidated Balance Sheets of $162.6 billion and $77.1 billion at December 31, 2008 and 2007, respectively, is the amount of the mark-to-market value ("MTM") or fair value of the derivative contracts after giving effect to legally enforceable master netting agreements and cash collateral held by the Firm. These amounts represent the cost to the Firm to replace the contracts at current market rates should the counterparty default. However, in management's view, the appropriate measure of current credit risk should also reflect additional liquid securities held as collateral by the Firm of $19.8 billion and $9.8 billion at December 31, 2008 and 2007, respectively, resulting in total exposure, net of all collateral, of $142.8 billion and $67.3 billion at December 31, 2008 and 2007, respectively. Derivative receivables, net of collateral, increased $75.5 billion from December 31, 2007, primarily related to the decline in interest rates, widening credit spreads and volatile foreign exchange rates reflected in interest rate, credit and foreign exchange derivatives, respectively. The increase in 2008 also included positions acquired in the Bear Stearns merger.

The Firm also holds additional collateral delivered by clients at the initiation of transactions, and although this collateral does not reduce the balances noted in the table above, it is available as security against potential exposure that could arise should the MTM of the client's transactions move in the Firm's favor. As of December 31, 2008 and 2007, the Firm held $22.2 billion and $17.4 billion of this additional collateral, respectively. The derivative receivables MTM also do not include other credit enhancements in the form of letters of credit.

While useful as a current view of credit exposure, the net MTM value of the derivative receivables does not capture the potential future variability of that credit exposure. To capture the potential future variability of credit exposure, the Firm calculates, on a client-by-client basis, three measures of potential derivatives-related credit loss: Peak, Derivative Risk Equivalent ("DRE"), and Average exposure ("AVG"). These measures all incorporate netting and collateral benefits, where applicable.

Peak exposure to a counterparty is a measure of exposure calculated at a 97.5% confidence level. Derivative Risk Equivalent exposure is a measure that expresses the risk of derivative exposure on a basis intended to be equivalent to the risk of loan exposures. The measurement is done by equating the unexpected loss in a derivative counterparty exposure (which takes into consideration both the loss



volatility and the credit rating of the counterparty) with the unexpected loss in a loan exposure (which takes into consideration only the credit rating of the counterparty). DRE is a less extreme measure of potential credit loss than Peak and is the primary measure used by the Firm for credit approval of derivative transactions.

Finally, AVG is a measure of the expected MTM value of the Firm's derivative receivables at future time periods, including the benefit of collateral. AVG exposure over the total life of the derivative contract is used as the primary metric for pricing purposes and is used to calculate credit capital and the Credit Valuation Adjustment ("CVA"), as further described below. Average exposure was $83.7 billion and $47.1 billion at December 31, 2008 and 2007, respectively, compared with derivative receivables MTM, net of all collateral, of $142.8 billion and $67.3 billion at December 31, 2008 and 2007, respectively.

The MTM value of the Firm's derivative receivables incorporates an adjustment, the CVA, to reflect the credit quality of counterparties. The CVA is based upon the Firm's AVG to a counterparty and the counterparty's credit spread in the credit derivatives market. The primary components of changes in CVA are credit spreads, new deal activity or unwinds, and changes in the underlying market environment. The Firm believes that active risk management is essential to controlling the dynamic credit risk in the derivatives portfolio. In addition, the Firm takes into consideration the potential for correlation between the Firm's AVG to a counterparty and the counterparty's credit quality within the credit approval process. The Firm risk manages exposure to changes in CVA by entering into credit derivative transactions, as well as interest rate, foreign exchange, equity and commodity derivative transactions.

The graph below shows exposure profiles to derivatives over the next ten years as calculated by the DRE and AVG metrics. The two measures generally show declining exposure after the first year, if no new trades were added to the portfolio.

Exposure profile of derivatives measures

The following table summarizes the ratings profile of the Firm's derivative receivables MTM, net of other liquid securities collateral, for the dates indicated.

Ratings profile of derivative receivables MTM

Rating equivalent	**2008**		2007	
December 31, (in millions, except ratios)	Exposure net of all collateral	% of exposure net of all collateral	Exposure net of all collateral	% of exposure net of all collateral
AAA/Aaa to AA-/Aa3	**$ 68,708**	**48%**	$ 38,314	57%
A+/A1 to A-/A3	**24,748**	**17**	9,855	15
BBB+/Baa1 to BBB-/Baa3	**15,747**	**11**	9,335	14
BB+/Ba1 to B-/B3	**28,186**	**20**	9,451	14
CCC+/Caa1 and below	**5,421**	**4**	357	—
Total	**$ 142,810**	**100%**	$ 67,312	100%

The increase in noninvestment grade derivative receivables reflects a weakening credit environment. The Firm actively pursues the use of collateral agreements to mitigate counterparty credit risk in derivatives. The percentage of the Firm's derivatives transactions subject to collateral agreements was 83% as of December 31, 2008, largely unchanged from 82% at December 31, 2007.

The Firm posted $99.1 billion and $33.5 billion of collateral at December 31, 2008 and 2007, respectively.

Certain derivative and collateral agreements include provisions that require the counterparty and/or the Firm, upon specified downgrades in their respective credit ratings, to post collateral for the benefit of the other party. The impact of a single-notch ratings downgrade to JPMorgan Chase Bank, N.A., from its rating of "AA-" to "A+" at December 31, 2008, would have required $2.2 billion of additional collateral to be posted by the Firm. The impact of a six-notch ratings downgrade (from "AA-" to "BBB-") would have required $6.4 billion of additional collateral. Certain derivative contracts also provide for termination of the contract, generally upon a downgrade of either the Firm or the counterparty, at the then-existing MTM value of the derivative contracts.

Credit derivatives

Credit derivatives are financial contracts that isolate credit risk from an underlying instrument (such as a loan or security) and transfer that risk from one party (the buyer of credit protection) to another (the seller of credit protection). The Firm is both a purchaser and seller of credit protection. As a purchaser of credit protection, the Firm has risk that the counterparty providing the credit protection will default. As a seller of credit protection, the Firm has risk that the underlying instrument referenced in the contract will be subject to a credit event. Of the Firm's $162.6 billion of total derivative receivables MTM at December 31, 2008, $44.7 billion, or 27%, was associated with credit derivatives, before the benefit of liquid securities collateral.

One type of credit derivatives the Firm enters into with counterparties are credit default swaps ("CDS"). For further detailed discussion of these and other types of credit derivatives, see Note 32 on pages 214–217 of this Annual Report. The large majority of CDS are subject to collateral arrangements to protect the Firm from counterparty credit risk. In 2008, the frequency and size of defaults for both trading counterparties and the underlying debt referenced in credit derivatives were well above historical norms. The use of collateral to settle against defaulting counterparties generally performed as designed in significantly mitigating the Firm's exposure to these counterparties.

During 2008, the Firm worked with other significant market participants to develop mechanisms to reduce counterparty credit risk, including the cancellation of offsetting trades. In 2009, it is anticipated that one or more central counterparties for CDS will be established and JPMorgan Chase will face these central counterparties, or clearing houses, for an increasing portion of its CDS business.

The Firm uses credit derivatives for two primary purposes: first, in its capacity as a market-maker in the dealer/client business to meet the needs of customers; and second, in order to mitigate the Firm's own credit risk associated with its overall derivative receivables and traditional commercial credit lending exposures (loans and unfunded commitments), as well as its exposure to residential and commercial mortgages.

The following table presents the Firm's notional amounts of credit derivatives protection purchased and sold as of December 31, 2008 and 2007, distinguishing between dealer/client activity and credit portfolio activity.

	Notional amount				
	Dealer/client		Credit portfolio		
December 31, (in billions)	Protection purchased[a]	Protection sold[a]	Protection purchased[b]	Protection sold	**Total**
2008	**$4,097**	**$4,198**	**$92**	**$1**	**$8,388**
2007	$ 3,999	$ 3,896	$ 70	$ 2	$ 7,967

(a) Includes $3.9 trillion at December 31, 2008, of notional exposure within protection purchased and protection sold where the underlying reference instrument is identical. The remaining exposure includes single name and index CDS which the Firm purchased to manage the remaining net protection sold. For a further discussion on credit derivatives, see Note 32 on pages 214–217 of this Annual Report.

(b) Includes $34.9 billion and $31.1 billion at December 31, 2008 and 2007, respectively, that represented the notional amount for structured portfolio protection; the Firm retains a minimal first risk of loss on this portfolio.

Dealer/client business

Within the dealer/client business, the Firm actively utilizes credit derivatives by buying and selling credit protection, predominantly on corporate debt obligations, in response to client demand for credit risk protection on the underlying reference instruments. Protection may be bought or sold by the Firm on single reference debt instruments ("single-name" credit derivatives), portfolios of referenced instruments ("portfolio" credit derivatives) or quoted indices ("indexed" credit derivatives).The risk positions are largely matched as the Firm's exposure to a given reference entity under a contract to sell protection to a counterparty may be offset partially, or entirely, with a contract to purchase protection from another counterparty on the same underlying instrument. Any residual default exposure and spread risk is actively managed by the Firm's various trading desks.

At December 31, 2008, the total notional amount of protection purchased and sold increased $421 billion from year-end 2007. The increase was primarily as a result of the merger with Bear Stearns, partially offset by the impact of industry efforts to reduce offsetting trade activity.

Credit portfolio activities

In managing its wholesale credit exposure the Firm purchases protection through single-name and portfolio credit derivatives to manage the credit risk associated with loans, lending-related commitments and derivative receivables. Gains or losses on the credit derivatives are expected to offset the unrealized increase or decrease in

credit risk on the loans, lending-related commitments or derivative receivables. This activity does not reduce the reported level of assets on the balance sheet or the level of reported off-balance sheet commitments, though it does provide the Firm with credit risk protection. The Firm also diversifies its exposures by selling credit protection, which increases exposure to industries or clients where the Firm has little or no client-related exposure, however, this activity is not material to the Firm's overall credit exposure.

Use of single-name and portfolio credit derivatives

December 31, (in millions)	Notional amount of protection purchased	
	2008	2007
Credit derivatives used to manage:		
Loans and lending-related commitments	**$ 81,227**	$ 63,645
Derivative receivables	**10,861**	6,462
Total[a]	**$ 92,088**	$ 70,107

(a) Included $34.9 billion and $31.1 billion at December 31, 2008 and 2007, respectively, that represented the notional amount for structured portfolio protection; the Firm retains a first risk of loss on this portfolio.

The credit derivatives used by JPMorgan Chase for credit portfolio management activities do not qualify for hedge accounting under SFAS 133, and therefore, effectiveness testing under SFAS 133 is not performed. Loan interest and fees are generally recognized in net interest income, and impairment is recognized in the provision for credit losses. This asymmetry in accounting treatment between loans and lending-related commitments and the credit derivatives utilized in credit portfolio management activities causes earnings volatility that is not representative, in the Firm's view, of the true changes in value of the Firm's overall credit exposure. The MTM related to the Firm's credit derivatives used for managing credit exposure, as well as the MTM related to the CVA, which reflects the credit quality of derivatives counterparty exposure, are included in the table below. These results can vary from period to period due to market conditions that impact specific positions in the portfolio. For a further discussion of credit derivatives, see Note 32 on pages 214–217 of this Annual Report.

Year ended December 31, (in millions)	**2008**	2007	2006
Hedges of lending-related commitments[a]	**$ 2,216**	$ 350	$ (246)
CVA and hedges of CVA[a]	**(2,359)**	(363)	133
Net gains (losses)[b]	**$ (143)**	$ (13)	$ (113)

(a) These hedges do not qualify for hedge accounting under SFAS 133.
(b) Excludes gains of $530 million, $373 million and $56 million for the years ended December 31, 2008, 2007 and 2006, respectively, of other principal transactions revenue that are not associated with hedging activities. The amount for 2008 and 2007 incorporates an adjustment to the valuation of the Firm's derivative liabilities as a result of the adoption of SFAS 157 on January 1, 2007.

The Firm also actively manages wholesale credit exposure through IB and CB loan and commitment sales. During 2008, 2007 and 2006, these sales of $3.9 billion, $4.9 billion and $4.0 billion of loans and commitments, respectively, resulted in losses of $41 million and $7 million in 2008 and 2007 and gains of $83 million in 2006, respectively. These results include gains on sales of nonperforming loans, as discussed on page 95 of this Annual Report. These activities are not related to the Firm's securitization activities, which are undertaken for liquidity and balance sheet management purposes. For a further discussion of securitization activity, see Liquidity Risk Management and Note 16 on pages 88–92 and 180–188, respectively, of this Annual Report.

Lending-related commitments

Wholesale lending-related commitments were $379.9 billion at December 31, 2008, compared with $446.7 billion at December 31, 2007. The decrease was largely related to a reduction in multi-seller conduit-related commitments. In the Firm's view, the total contractual amount of these instruments is not representative of the Firm's actual credit risk exposure or funding requirements. In determining the amount of credit risk exposure the Firm has to wholesale lending-related commitments, which is used as the basis for allocating credit risk capital to these instruments, the Firm has established a "loan-equivalent" amount for each commitment; this amount represents the portion of the unused commitment or other contingent exposure that is expected, based upon average portfolio historical experience, to become outstanding in the event of a default by an obligor. The loan-equivalent amount of the Firm's lending-related commitments was $204.3 billion and $238.7 billion as of December 31, 2008 and 2007, respectively.

Emerging markets country exposure

The Firm has a comprehensive internal process for measuring and managing exposures to emerging markets countries. There is no common definition of emerging markets but the Firm generally, though not exclusively, includes in its definition those countries whose sovereign debt ratings are equivalent to "A+" or lower. Exposures to a country include all credit-related lending, trading and investment activities, whether cross-border or locally funded. In addition to monitoring country exposures, the Firm uses stress tests to measure and manage the risk of extreme loss associated with sovereign crises.

The following table presents the Firm's exposure to the top five emerging markets countries. The selection of countries is based solely on the Firm's largest total exposures by country and not the Firm's view of any actual or potentially adverse credit conditions. Exposure is reported based upon the country where the assets of the obligor, counterparty or guarantor are located. Exposure amounts are adjusted for collateral and for credit enhancements (e.g., guarantees and letters of credit) provided by third parties; outstandings supported by a guarantor outside the country or backed by collateral held outside the country are assigned to the country of the enhancement provider. In addition, the effects of credit derivative hedges and other short credit or equity trading positions are reflected in the following table. Total exposure includes exposure to both government and private sector entities in a country.

Top 5 emerging markets country exposure

At December 31, 2008 (in billions)	Cross-border Lending[a]	Trading[b]	Other[c]	Total	Local[d]	Total exposure
South Korea	**$2.9**	**$1.6**	**$0.9**	**$ 5.4**	**$2.3**	**$ 7.7**
India	**2.2**	**2.8**	**0.9**	**5.9**	**0.6**	**6.5**
China	**1.8**	**1.6**	**0.3**	**3.7**	**0.8**	**4.5**
Brazil	**1.8**	**—**	**0.5**	**2.3**	**1.3**	**3.6**
Taiwan	**0.1**	**0.2**	**0.3**	**0.6**	**2.5**	**3.1**

At December 31, 2007 (in billions)	Cross-border Lending[a]	Trading[b]	Other[c]	Total	Local[d]	Total exposure
South Korea	$ 3.2	$ 2.6	$ 0.7	$ 6.5	$ 3.4	$ 9.9
Brazil	1.1	(0.7)	1.2	1.6	5.0	6.6
Russia	2.9	1.0	0.2	4.1	0.4	4.5
India	1.9	0.8	0.8	3.5	0.6	4.1
China	2.2	0.3	0.4	2.9	0.3	3.2

(a) Lending includes loans and accrued interest receivable, interest-bearing deposits with banks, acceptances, other monetary assets, issued letters of credit net of participations, and undrawn commitments to extend credit.
(b) Trading includes: (1) issuer exposure on cross-border debt and equity instruments, held both in trading and investment accounts, adjusted for the impact of issuer hedges, including credit derivatives; and (2) counterparty exposure on derivative and foreign exchange contracts as well as security financing trades (resale agreements and securities borrowed).
(c) Other represents mainly local exposure funded cross-border.
(d) Local exposure is defined as exposure to a country denominated in local currency, booked and funded locally. Any exposure not meeting these criteria is defined as cross-border exposure.

CONSUMER CREDIT PORTFOLIO

JPMorgan Chase's consumer portfolio consists primarily of residential mortgages, home equity loans, credit cards, auto loans, student loans and business banking loans, with a primary focus on serving the prime consumer credit market. The consumer credit portfolio also includes certain loans acquired in the Washington Mutual transaction, primarily mortgage, home equity and credit card loans. The RFS portfolio includes home equity lines of credit and mortgage loans with interest-only payment options to predominantly prime borrowers, as well as certain payment option loans acquired from Washington Mutual that may result in negative amortization.

A substantial portion of the consumer loans acquired in the Washington Mutual transaction were identified as credit-impaired in the third quarter of 2008 based on a preliminary analysis of the acquired portfolio. In addition, as of the acquisition date, a $1.4 billion accounting conformity provision was recorded to reflect the Firm's preliminary estimate of incurred losses related to the portion of the acquired consumer loans that were not considered to be credit-impaired. During the fourth quarter of 2008, the analysis of acquired loans was substantially completed, resulting in a $12.4 billion increase in the credit-impaired loan balances and a corresponding decrease in the non-credit-impaired loan balances. In addition, the estimate of incurred losses related to the non-credit-impaired portfolio was finalized, resulting in a $476 million decrease in the accounting conformity provision for these loans. The purchased credit-impaired loans, which were identified as impaired based on an analysis of risk characteristics, including product type, loan-to-value ratios, FICO scores and delinquency status, are accounted for under SOP 03-3 and were recorded at fair value under SOP 03-3 as of the acquisition date. The fair value of these loans includes an estimate of losses that are expected to be incurred over the estimated remaining lives of the loans, and therefore no allowance for loan losses was recorded for these loans as of the transaction date.

The credit performance of the consumer portfolio across the entire consumer credit product spectrum continues to be negatively affected by the economic environment. High unemployment and weaker overall economic conditions have resulted in increased delinquencies, and continued weak housing prices have driven a significant increase in loss severity. Nonperforming loans and assets continued to increase through year-end 2008, a key indicator that charge-offs will continue to rise in 2009. Additional deterioration in the overall economic environment, including continued deterioration in the labor market, could cause delinquencies to increase beyond the Firm's current expectations, resulting in significant increases in losses in 2009.

Over the past year, the Firm has taken actions to reduce risk exposure by tightening both underwriting and loan qualification standards for real estate lending, as well as for consumer lending for non-real estate products. Tighter income verification, more conservative collateral valuation, reduced loan-to-value maximums and higher FICO and custom risk score requirements are just some of the actions taken to date to mitigate risk. These actions have resulted in significant reductions in new originations of "risk layered" loans (e.g., loans with high loan-to-value ratios to borrowers with low FICO scores) and improved alignment of loan pricing. New originations of subprime mortgage loans, option ARMs and broker originated-mortgage and home equity loans have been eliminated entirely.

In the fourth quarter of 2008, the Firm announced plans to significantly expand loss mitigation efforts related to its mortgage and home equity portfolios, including a systematic review of the real estate portfolio to identify homeowners most in need of assistance. In addition, the Firm announced plans to open regional counseling centers, hire additional loan counselors, introduce new financing alternatives, proactively reach out to borrowers to offer pre-qualified modifications, and commence a new process to independently review each

loan before moving it into the foreclosure process. During the implementation period of these loss mitigation efforts, which were substantially complete in early 2009, the Firm did not place loans into foreclosure. These loss mitigation efforts, which generally represent various forms of term extensions, rate reductions and forbearances, are expected to result in additional increases in the balances of modified loans carried on the Firm's balance sheet, including loans accounted for as troubled debt restructurings, while minimizing the economic loss to the Firm and assisting homeowners to remain in their homes.

The following table presents managed consumer credit–related information for the dates indicated.

Consumer portfolio

As of or for the year ended December 31, (in millions, except ratios)	Credit exposure		Nonperforming loans[g][h][i]		90 days past due and still accruing		Net charge-offs		Average annual net charge-off rate[j]	
	2008	2007	**2008**	2007	**2008**	2007	**2008**	2007	**2008**	2007

Credit card[f]	**623,702**	714,848								
All other loans	**12,257**	11,429								
Total lending-related commitments	**741,507**	815,936								
Total consumer credit portfolio	**$ 1,309,932**	$1,194,935								
Memo: Credit card – managed	**$ 190,317**	$ 157,053	**$ 4**	$ 7	**$ 4,451**	$ 2,597	**$ 8,168**	$ 5,496	**5.01%**	3.68%

(a) Includes RFS, CS and residential mortgage loans reported in the Corporate/Private Equity segment, as well as approximately $80.0 billion in non-credit-impaired consumer loans acquired in the Washington Mutual transaction.
(b) Excludes operating lease-related assets of $2.2 billion and $1.9 billion for December 31, 2008 and 2007, respectively.
(c) Includes loans for prime mortgage and other (largely student loans) of $206 million and $1.8 billion at December 31, 2008, respectively, and $570 million and $3.4 billion at December 31, 2007, respectively.
(d) Purchased credit-impaired loans represent loans acquired in the Washington Mutual transaction that were considered credit-impaired under SOP 03-3, and include $6.4 billion of loans that were considered nonperforming by Washington Mutual prior to the transaction closing. Under SOP 03-3, these loans are considered to be performing loans as of the transaction date and accrete interest income over the estimated life of the loan when cash flows are reasonably estimable, even if the underlying loans are contractually past due. For additional information, see Note 14 on pages 175–178 of this Annual Report.
(e) Represents securitized credit card receivables. For a further discussion of credit card securitizations, see CS on pages 63–65 of this Annual Report.
(f) The credit card and home equity lending-related commitments represent the total available lines of credit for these products. The Firm has not experienced, and does not anticipate, that all available lines of credit will be utilized at the same time. For credit card commitments and home equity commitments (if certain conditions are met), the Firm can reduce or cancel these lines of credit by providing the borrower prior notice or, in some cases, without notice as permitted by law.
(g) Excludes purchased credit-impaired loans accounted for under SOP 03-3 that were acquired as part of the Washington Mutual transaction. These loans are accounted for on a pool basis and the pools are considered to be performing under SOP 03-3.
(h) Excludes nonperforming assets related to: (1) loans eligible for repurchase, as well as loans repurchased from GNMA pools that are insured by U.S. government agencies of $3.3 billion for December 31, 2008 and $1.5 billion for December 31, 2007; and (2) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program of $437 million and $417 million as of December 31, 2008 and 2007, respectively. These amounts for GNMA and student loans are excluded, as reimbursement is proceeding normally.
(i) During the second quarter of 2008, the Firm's policy for classifying subprime mortgage and home equity loans as nonperforming was changed to conform to all the other home lending products. Amounts for 2007 have been revised to reflect this change.
(j) Net charge-off rates exclude average loans held-for-sale of $2.8 billion and $10.6 billion for 2008 and 2007, respectively.

The following table presents the consumer nonperforming assets by business segment as of December 31, 2008 and 2007.

	2008				2007			
		Assets acquired loan satisfactions				Assets acquired in loan satisfactions		
As of December 31, (in millions)	Nonperforming loans	Real estate owned	Other	Nonperforming assets	Nonperforming loans	Real estate owned	Other	Nonperforming assets
Retail Financial Services	**$ 6,548**	**$ 2,183**	**$ 110**	**$ 8,841**	$ 2,760	$ 477	$ 72	$ 3,309
Card Services	**4**	**—**	**—**	**4**	7	—	—	7
Corporate/Private Equity	**19**	**1**	**—**	**20**	1	—	—	1
Total	**$ 6,571**	**$ 2,184**	**$ 110**	**$ 8,865**	$ 2,768	$ 477	$ 72	$ 3,317

The Firm regularly evaluates market conditions and overall economic returns and makes an initial determination of whether new originations will be held-for-investment or sold within the foreseeable future. The Firm also periodically evaluates the expected economic returns of previously originated loans under prevailing market conditions to determine whether their designation as held-for-sale or held-for-investment continues to be appropriate. When the Firm determines that a change in this designation is appropriate, the loans are transferred to the appropriate classification. During the third and fourth quarters of 2007, in response to changes in market conditions, the Firm designated as held-for-investment all new originations of subprime mortgage loans, as well as subprime mortgage loans that were previously designated held-for-sale. In addition, all new prime mortgage originations that cannot be sold to U.S. government agencies and U.S. government-sponsored enterprises have been designated as held-for-investment. Prime mortgage loans originated with the intent to sell are accounted for at fair value under SFAS 159 and are classified as trading assets in the Consolidated Balance Sheets.

The following discussion relates to the specific loan and lending-related categories within the consumer portfolio. Information regarding combined loan-to-value ratios ("CLTVs") and loan-to-value ratios ("LTVs") were estimated based on the initial appraisal obtained at the time of origination, adjusted using relevant market indicies for housing price changes that have occurred since origination. The estimated value of the homes could vary from actual market values due to changes in condition of the underlying property, variations in housing price changes within metropolitan statistical areas ("MSAs") and other factors.

Home equity: Home equity loans at December 31, 2008, were $114.3 billion, excluding purchased credit-impaired loans, an increase of $19.5 billion from year-end 2007, primarily reflecting the addition of loans acquired in the Washington Mutual transaction. The 2008 provision for credit losses for the home equity portfolio includes net increases of $2.2 billion to the allowance for loan losses for 2008 for the heritage JPMorgan Chase portfolio as a result of the economic environment noted above. The Firm estimates that loans with effective CLTVs in excess of 100% represented approximately 22% of the home equity portfolio. In response to continued economic weakness, loan underwriting and account management criteria have been tightened, with a particular focus on MSAs with the most significant housing price declines. New originations of home equity loans have decreased significantly, as additional loss mitigation strategies have been employed; these strategies include the elimination of stated income and broker originated loans, a significant reduction of maximum CLTVs for new originations, which now range from 50% to 70%, and additional restrictions on new originations in geographic areas experiencing the greatest housing price depreciation and highest unemployment. Other loss mitigation strategies include the reduction or closure of outstanding credit lines for borrowers who have experienced significant increases in CLTVs or decreases in creditworthiness (e.g. declines in FICO scores.)

Mortgage: Mortgage loans at December 31, 2008, which include prime mortgages, subprime mortgages, option ARMs and loans held-for-sale, were $96.8 billion, excluding purchased credit-impaired loans, reflecting a $40.8 billion increase from year-end 2007, primarily reflecting the addition of loans acquired in the Washington Mutual transaction.

Prime mortgages of $72.5 billion increased $31.9 billion from December 2007 as a result of loans acquired in the Washington Mutual transaction and, to a lesser extent, additional originations into the portfolio. The 2008 provision for credit losses includes a net increase of $1.1 billion to the allowance for loan losses for the heritage JPMorgan Chase portfolio as a result of the economic environment noted above. The Firm estimates that loans with effective LTVs in excess of 100% represented approximately 18% of the prime mortgage portfolio. The Firm has tightened underwriting standards for nonconforming prime mortgages in recent quarters, including eliminating stated income products, reducing LTV maximums, and eliminating the broker origination channel.

Subprime mortgages of $15.3 billion, excluding purchased credit-impaired loans, decreased slightly from December 31, 2007, as the discontinuation of new originations was predominantly offset by loans acquired in the Washington Mutual transaction. The year-to-date provision for credit losses includes a net increase of $1.4 billion to the allowance for loan losses for the heritage JPMorgan Chase portfolio as a result of the economic environment noted above. The Firm estimates that loans with effective LTVs in excess of 100% represented approximately 27% of the subprime mortgage portfolio.

Option ARMs of $9.0 billion, excluding purchased credit-impaired loans, were acquired in the Washington Mutual transaction. New originations of option ARMs were discontinued by Washington

Mutual prior to the date of the Washington Mutual transaction. This portfolio is primarily comprised of loans with low LTVs and high borrower FICOs and for which the Firm currently expects substantially lower losses in comparison with the purchased credit-impaired portfolio. The Firm has not, and does not, originate option ARMs.

Option ARMs are adjustable-rate mortgage products that provide the borrower with the option to make a fully amortizing, interest-only, or minimum payment. The minimum payment is based upon the interest rate charged during the introductory period. This introductory rate is typically well below the fully indexed rate. The fully indexed rate is calculated using an index rate plus a margin. Once the introductory period ends, the contractual interest rate charged on the loan increases to the fully indexed rate. If the borrower continues to make the minimum monthly payment after the introductory period ends, the payment may not be sufficient to cover interest accrued in the previous month. In this case, the loan will "negatively amortize" as unpaid interest is deferred and added to the principal balance of the loan. Option ARMs typically become fully amortizing loans upon reaching a negative amortization cap or on dates specified in the borrowing agreement, at which time the required monthly payment generally increases substantially.

Auto loans: As of December 31, 2008, auto loans of $42.6 billion increased slightly from year-end 2007. The allowance for loan losses for the auto loan portfolio was increased during 2008, reflecting an increase in estimated losses due to an increase in loss severity and further deterioration of older vintage loans as a result of the worsening credit environment and declines in auto resale values. The auto loan portfolio reflects a high concentration of prime quality credits. In response to recent increases in loan delinquencies and credit losses, particularly in MSAs experiencing the greatest housing price depreciation and highest unemployment, credit underwriting criteria have been tightened, which has resulted in the reduction of both extended-term and high loan-to-value financing.

Credit card: JPMorgan Chase analyzes its credit card portfolio on a managed basis, which includes credit card receivables on the Consolidated Balance Sheets and those receivables sold to investors through securitization. Managed credit card receivables were $190.3 billion at December 31, 2008, an increase of $33.3 billion from year-end 2007, reflecting the acquisition of credit card loans as part of the Washington Mutual transaction, as well as organic growth in the portfolio.

The managed credit card net charge-off rate increased to 5.01% for 2008 from 3.68% in 2007. This increase was due primarily to higher charge-offs as a result of the current economic environment, especially in areas experiencing the greatest housing price depreciation and highest unemployment. The 30-day managed delinquency rate increased to 4.97% at December 31, 2008, from 3.48% at December 31, 2007, partially as a result of the addition of credit card loans acquired in the Washington Mutual transaction. Excluding the Washington Mutual portfolio, the 30-day managed delinquency rate was 4.36%. The Allowance for loan losses was increased due to higher estimated net charge-offs in the portfolio. As a result of continued weakness in housing markets, account acquisition credit criteria and account management credit practices have been tightened, particularly in MSAs experiencing significant home price declines. The managed credit card portfolio continues to reflect a well-seasoned, largely rewards-based portfolio that has good U.S. geographic diversification.

All other loans: All other loans primarily include business banking loans (which are highly collateralized loans, often with personal loan guarantees), student loans, and other secured and unsecured consumer loans. As of December 31, 2008, other loans, including loans held-for-sale, of $35.5 billion were up $6.8 billion from year-end 2007, primarily as a result of organic growth in business banking loans and student loans, as well as an increase in business banking loans as a result of the Washington Mutual transaction.

Purchased credit-impaired loans: Purchased credit-impaired loans of $88.8 billion in the home lending portfolio represent loans acquired in the Washington Mutual transaction that were recorded at fair value at the time of acquisition under SOP 03-3. The fair value of these loans includes an estimate of losses that are expected to be incurred over the estimated remaining lives of the loans, and therefore no allowance for loan losses was recorded for these loans as of the transaction date. Through year-end 2008, the credit performance of these loans has generally been consistent with the assumptions used in determining the initial fair value of these loans, and the Firm's original expectations regarding the amounts and timing of future cash flows has not changed. A probable decrease in management's expectation of future cash collections related to these loans could result in the need to record an allowance for credit losses related to these loans in the future. A significant and probable increase in expected cash flows would generally result in an increase in interest income recognized over the remaining life of the underlying pool of loans.

Other real estate owned: As part of the residential real estate foreclosure process, loans are written down to net realizable value less a cost to sell the asset. In those instances where the Firm gains title, ownership and possession of individual properties at the completion of the foreclosure process, these Other Real Estate Owned (OREO) assets are managed for prompt sale and disposition at the best possible economic value. Any further gain or loss on sale of the disposition of OREO assets are recorded as part of other income.

The following tables present the geographic distribution of consumer credit outstandings by product as of December 31, 2008 and 2007, excluding purchased credit-impaired loans.

ALLOWANCE FOR CREDIT LOSSES

JPMorgan Chase's allowance for credit losses is intended to cover probable credit losses, including losses where the asset is not specifically identified or the size of the loss has not been fully determined. At least quarterly, the allowance for credit losses is reviewed by the Chief Executive Officer, the Chief Risk Officer, the Chief Financial Officer and the Controller of the Firm, and discussed with the Risk Policy and Audit Committees of the Board of Directors of the Firm. The allowance is reviewed relative to the risk profile of the Firm's credit portfolio and current economic conditions and is adjusted if, in management's judgment, changes are warranted. The allowance includes an asset-specific and a formula-based component. For further discussion of the components of the allowance for credit losses, see Critical Accounting Estimates Used by the Firm on pages 119–123 and Note 15 on pages 178–180 of this Annual Report. At December 31, 2008, management deemed the allowance for credit losses to be appropriate (i.e., sufficient to absorb losses that are inherent in the portfolio, including losses that are not specifically identified or for which the size of the loss has not yet been fully determined).

Summary of changes in the allowance for credit losses

Year ended December 31, (in millions)	2008 Wholesale	2008 Consumer	2008 Total	2007 Wholesale	2007 Consumer	2007 Total

(a) Reflects the effect of the adoption of SFAS 159 at January 1, 2007. For a further discussion of SFAS 159, see Note 5 on pages 156–158 of this Annual Report.
(b) Related to the Washington Mutual transaction in 2008.
(c) Primarily related to the transfer of loans and lending-related commitments from RFS to CB during the first quarter of 2008.
(d) Wholesale loans held-for-sale and loans at fair value were $14.0 billion and $23.6 billion at December 31, 2008 and 2007, respectively. These amounts were excluded when calculating the allowance coverage ratios.
(e) Consumer loans held-for-sale were $2.0 billion and $4.0 billion at December 31, 2008 and 2007, respectively. These amounts were excluded when calculating the allowance coverage ratios.
(f) Average wholesale loans held-for-sale and loans at fair value were $18.9 billion and $18.6 billion for the years ended December 31, 2008 and 2007, respectively. These amounts were excluded when calculating the net charge-off rates.
(g) Average consumer (excluding card) loans held-for-sale and loans at fair value were $2.8 billion and $10.6 billion for the years ended December 31, 2008 and 2007, respectively. These amounts were excluded when calculating the net charge-off rates.
(h) Includes $88.8 billion of home lending credit-impaired loans acquired in the Washington Mutual transaction and accounted for under SOP 03-3 at December 31, 2008. These loans were accounted for at fair value on the acquisition date, which reflected expected cash flows (including credit losses) over the remaining life of the portfolio. No allowance for loan losses has been recorded for these loans as of December 31, 2008.
(i) Partially related to the transfer of allowance between wholesale and consumer in conjunction with prime mortgages transferred to the Corporate/Private Equity sector.

The allowance for credit losses increased $13.7 billion from the prior year to $23.8 billion. The increase included $4.1 billion of allowance related to noncredit-impaired loans acquired in the Washington Mutual transaction and the related accounting conformity provision. Excluding held-for-sale loans, loans carried at fair value, and purchased credit-impaired consumer loans, the allowance for loan losses represented 3.62% of loans at December 31, 2008, compared with 1.88% at December 31, 2007.

The consumer allowance for loan losses increased $10.5 billion from the prior year as a result of the Washington Mutual transaction and increased allowance for loan loss in residential real estate and credit card. The increase included additions to the allowance for loan losses of $4.7 billion driven by higher estimated losses for residential mortgage and home equity loans as the weak labor market and weak overall economic conditions have resulted in increased delinquencies, while continued weak housing prices have driven a significant increase in loss severity. The allowance for loan losses related to credit card increased $4.3 billion from the prior year primarily due to the acquired allowance and subsequent conforming provision for loan loss related to the Washington Mutual Bank acquisition and an increase in provision for loan losses of $2.3 billion in 2008 over 2007, as higher estimated net charge-offs are expected in the portfolio resulting from the current economic conditions.

The wholesale allowance for loan losses increase of $3.4 billion from December 31, 2007, reflected the effect of a weakening credit environment and the transfer of $4.9 billion of funded and unfunded leveraged lending commitments to retained loans from held-for-sale.

To provide for the risk of loss inherent in the Firm's process of extending credit, an allowance for lending-related commitments is held for both wholesale and consumer, which is reported in other liabilities. The wholesale component is computed using a methodology similar to that used for the wholesale loan portfolio, modified for expected maturities and probabilities of drawdown and has an asset-specific component and a formula-based component. For a further discussion on the allowance for lending-related commitment see Note 15 on pages 178–180 of this Annual Report. The allowance for lending-related commitments for both wholesale and consumer was $659 million and $850 million at December 31, 2008 and 2007, respectively. The decrease reflects the reduction in lending-related commitments at December 31, 2008. For more information, see page 102 of this Annual Report.

The following table presents the allowance for loan losses and net charge-offs (recoveries) by business segment at December 31, 2008 and 2007.

December 31,	Allowance for loan losses		Net charge-offs (recoveries) year ended	
(in millions)	**2008**	2007	**2008**	2007

Total	**$ 23,164**	$ 9,234	**$ 13,477**	$ 6,918

Provision for credit losses

The managed provision for credit losses includes amounts related to credit card securitizations. For the year ended December 31, 2008, the increase in the provision for credit losses was due to year-over-year increase in the allowance for credit losses largely related to the home equity, subprime mortgage, prime mortgage and credit card loan portfolios in the consumer businesses as well as in the allowance for credit losses related to the wholesale portfolio. The increase in the allowance for credit losses related to the wholesale provision for loan losses from the prior year was due to the weakening credit environment, loan growth and the transfer of $4.9 billion of funded and unfunded leveraged lending commitments to retained loans from held-for-sale. The decrease in provision for lending-related commitments from the prior year benefited from reduced balances of lending-related commitments.

Year ended December 31,	Provision for loan losses			Provision for lending-related commitments			Total provision for credit losses		
(in millions)	**2008**	2007	2006	**2008**	2007	2006	**2008**	2007	2006

Total provision for credit losses – reported	**21,237**	6,538	3,153	**(258)**	326	117	**20,979**	6,864	3,270
Credit card – securitized	**3,612**	2,380	2,210	**—**	—	—	**3,612**	2,380	2,210
Total provision for credit losses – managed	**$ 24,849**	$ 8,918	$ 5,363	**$ (258)**	$ 326	$117	**$ 24,591**	$ 9,244	$ 5,480

(a) Includes accounting conformity provisions related to the Washington Mutual transaction in 2008.
(b) Includes provision expense related to loans acquired in the Bear Stearns merger in the second quarter of 2008.
(c) Includes amounts related to held-for-investment prime mortgages transferred from AM to the Corporate/Private Equity segment.
(d) In November 2008, the Firm transferred $5.8 billion of higher quality credit card loans from the legacy Chase portfolio to a securitization trust previously established by Washington Mutual ("the Trust"). As a result of converting higher credit quality Chase-originated on-book receivables to the Trust's seller's interest which has a higher overall loss rate reflective of the total assets within the Trust, approximately $400 million of incremental provision expense was recorded during the fourth quarter. This incremental provision expense was recorded in the Corporate segment as the action related to the acquisition of Washington Mutual's banking operations. For further discussion of credit card securitizations, see Note 16 on pages 180–188 of this Annual Report.

MARKET RISK MANAGEMENT

Market risk is the exposure to an adverse change in the market value of portfolios and financial instruments caused by a change in market prices or rates.

Market risk management

Market risk is identified, measured, monitored, and controlled by Market Risk, a corporate risk governance function independent of the lines of business. Market Risk seeks to facilitate efficient risk/return decisions, reduce volatility in operating performance and make the Firm's market risk profile transparent to senior management, the Board of Directors and regulators. Market Risk is overseen by the Chief Risk Officer and performs the following functions:

- Establishment of a comprehensive market risk policy framework
- Independent measurement, monitoring and control of business segment market risk
- Definition, approval and monitoring of limits
- Performance of stress testing and qualitative risk assessments

Risk identification and classification

Market Risk works in partnership with the business segments to identify market risks throughout the Firm and define and monitor market risk policies and procedures. All business segments are responsible for the comprehensive identification and verification of market risks within their units. Risk-taking businesses have functions that act independently from trading personnel and are responsible for verifying risk exposures that the business takes. In addition to providing independent oversight for market risk arising from the business segments, Market Risk is also responsible for identifying exposures which may not be large within individual business segments but which may be large for the Firm in the aggregate. Regular meetings are held between Market Risk and the heads of risk-taking businesses to discuss and decide on risk exposures in the context of the market environment and client flows.

Positions that expose the Firm to market risk can be classified into two categories: trading and nontrading risk. Trading risk includes positions that are held by the Firm as part of a business segment or unit, the main business strategy of which is to trade or make markets. Unrealized gains and losses in these positions are generally reported in principal transactions revenue. Nontrading risk includes securities and other assets held for longer-term investment, mortgage servicing rights, and securities and derivatives used to manage the Firm's asset/liability exposures. Unrealized gains and losses in these positions are generally not reported in principal transactions revenue.

Trading risk
The Firm makes markets and trades its products across several different asset classes. These asset classes include primarily fixed income (which includes interest rate risk and credit spread risk), foreign exchange, equities and commodities. Trading risk arises from positions in these asset classes and may lead to the potential decline in net income (i.e., economic sensitivity) due to adverse changes in market rates, whether arising from client activities or proprietary positions taken by the Firm.

Nontrading risk
Nontrading risk arises from execution of the Firm's core business strategies, the delivery of products and services to its customers, and the positions the Firm undertakes to risk-manage its exposures.

These exposures can result from a variety of factors, including differences in the timing among the maturity or repricing of assets, liabilities and off-balance sheet instruments. Changes in the level and shape of market interest rate curves also may create interest rate risk, since the repricing characteristics of the Firm's assets do not necessarily match those of its liabilities. The Firm is also exposed to basis risk, which is the difference in the repricing characteristics of two floating-rate indices, such as the prime rate and 3-month LIBOR. In addition, some of the Firm's products have embedded optionality that impact pricing and balances.

The Firm's mortgage banking activities give rise to complex interest rate risks, as well as option and basis risk. Option risk arises primarily from prepayment options embedded in mortgages and changes in the probability of newly originated mortgage commitments actually closing. Basis risk results from different relative movements between mortgage rates and other interest rates.

Risk measurement

Tools used to measure risk
Because no single measure can reflect all aspects of market risk, the Firm uses various metrics, both statistical and nonstatistical, including:

- Nonstatistical risk measures
- Value-at-risk ("VaR")
- Loss advisories
- Drawdowns
- Economic value stress testing
- Earnings-at-risk stress testing
- Risk identification for large exposures ("RIFLE")

Nonstatistical risk measures
Nonstatistical risk measures other than stress testing include net open positions, basis point values, option sensitivities, market values, position concentrations and position turnover. These measures provide granular information on the Firm's market risk exposure. They are aggregated by line of business and by risk type, and are used for monitoring limits, one-off approvals and tactical control.

Value-at-risk ("VaR")
JPMorgan Chase's primary statistical risk measure, VaR, estimates the potential loss from adverse market moves in an ordinary market environment and provides a consistent cross-business measure of risk profiles and levels of diversification. VaR is used for comparing risks across businesses, monitoring limits, and as an input to economic capital calculations. VaR provides risk transparency in a normal trading environment. Each business day the Firm undertakes a comprehensive VaR calculation that includes both its trading and its nontrading risks. VaR for nontrading risk measures the amount of potential change in the fair values of the exposures related to these risks; however, for such risks, VaR is not a measure of reported revenue since nontrading activities are generally not marked to market through net income. Hedges of nontrading activities may be included in trading VaR since they are marked to market.

To calculate VaR, the Firm uses historical simulation, based on a one-day time horizon and an expected tail-loss methodology, which measures risk across instruments and portfolios in a consistent and comparable way. The simulation is based upon data for the previous 12 months. This approach assumes that historical changes in market values are representative of future changes; this is an assumption that may not always be accurate, particularly given the volatility in the current market environment. For certain products, an actual price time series is not available. In such cases, the historical simulation is done using a proxy time series to estimate the risk. It is likely that using an actual price time series for these products, if available, would impact the VaR results presented. In addition, certain risk parameters, such as correlation risk among certain IB trading instruments, are not fully captured in VaR.

In the third quarter of 2008, the Firm revised its VaR measurement to include additional risk positions previously excluded from VaR, thus creating, in the Firm's view, a more comprehensive view of its market risks. In addition, the Firm moved to calculating VaR using a 95% confidence level to provide a more stable measure of the VaR for day-to-day risk management. The following sections describe JPMorgan Chase's VaR measures under both the legacy 99% confidence level as well as the new 95% confidence level. The Firm intends to solely present the VaR at the 95% confidence level once information for two complete year-to-date periods is available.

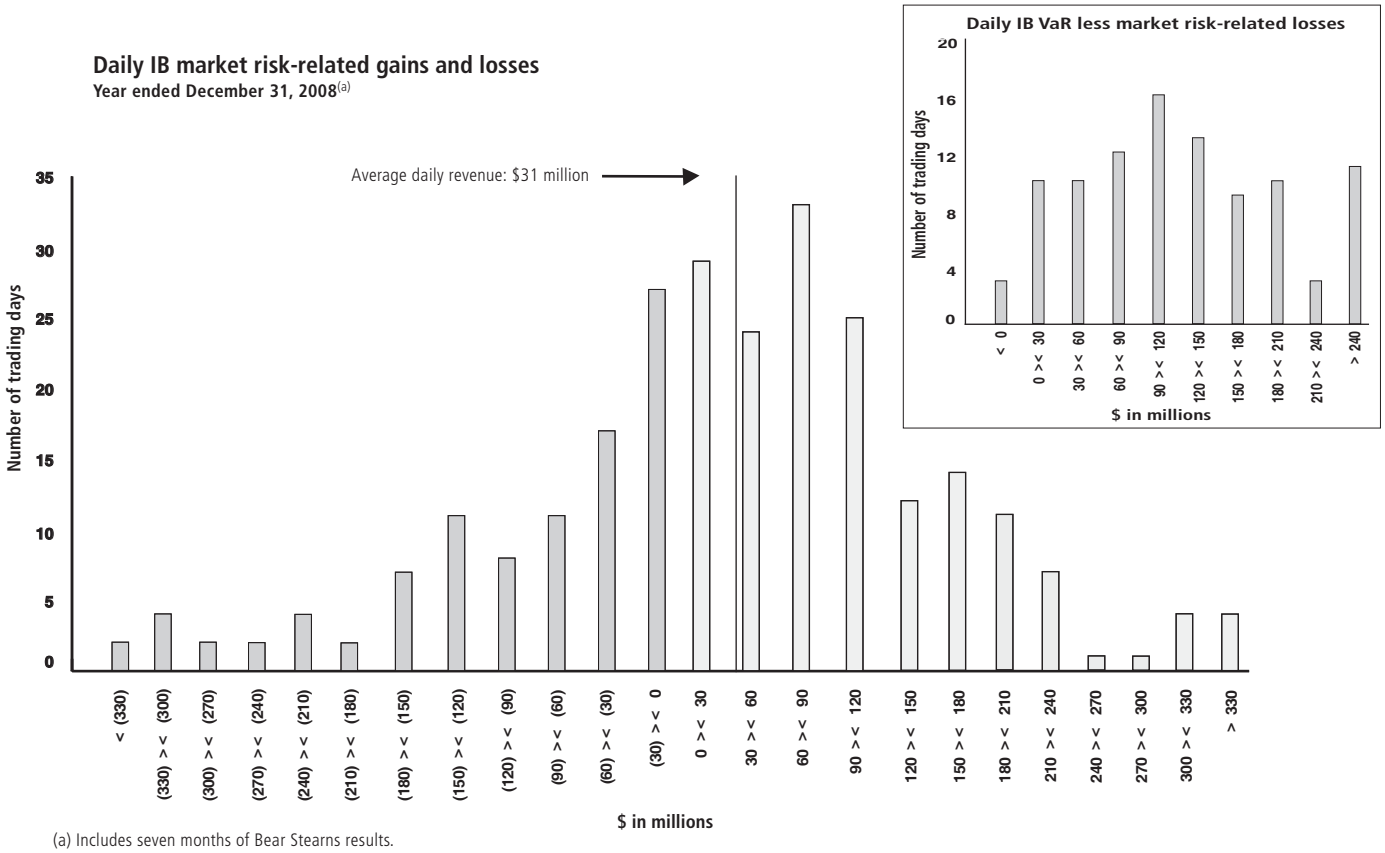
99% Confidence Level VaR

IB trading VaR by risk type and credit portfolio VaR

As of or for the year ended December 31,[a] (in millions)	2008			2007			At December 31,	
	Average	Minimum	Maximum	Average	Minimum	Maximum	**2008**	2007
By risk type:								
Fixed income	**$ 181**	**$ 99**	**$ 409**	$ 80	$ 25	$ 135	**$ 253**	$ 106
Foreign exchange	**34**	**13**	**90**	23	9	44	**70**	22
Equities	**57**	**19**	**187**	48	22	133	**69**	27
Commodities and other	**32**	**24**	**53**	33	21	66	**26**	27
Diversification	**(108)**[b]	**NM**[c]	**NM**[c]	(77)[b]	NM[c]	NM[c]	**(152)**[b]	(82)[b]
Trading VaR	**$ 196**	**$ 96**	**$ 420**	$ 107	$ 50	$ 188	**$ 266**	$ 100
Credit portfolio VaR	**69**	**20**	**218**	17	8	31	**171**	22
Diversification	**(63)**[b]	**NM**[c]	**NM**[b]	(18)[b]	NM[c]	NM[c]	**(120)**[b]	(19)[b]
Total trading and credit portfolio VaR	**$ 202**	**$ 96**	**$ 449**	$ 106	$ 50	$ 178	**$ 317**	$ 103

(a) The results for the year ended December 31, 2008, include five months of heritage JPMorgan Chase only results and seven months of results for the combined JPMorgan Chase and Bear Stearns; 2007 reflects heritage JPMorgan Chase results only.
(b) Average and period-end VaRs were less than the sum of the VaRs of its market risk components, which is due to risk offsets resulting from portfolio diversification. The diversification effect reflects the fact that the risks were not perfectly correlated. The risk of a portfolio of positions is therefore usually less than the sum of the risks of the positions themselves.
(c) Designated as not meaningful ("NM") because the minimum and maximum may occur on different days for different risk components, and hence it is not meaningful to compute a portfolio diversification effect.

Trading VaR includes substantially all trading activities in IB. Beginning in the fourth quarter of 2008, the credit spread sensitivities of certain mortgage products were included in trading VaR. This change had an insignificant net impact on the average fourth quarter 2008 VaR. However, trading VaR does not include: held-for-sale funded loan and unfunded commitments positions (however, it does include hedges of those positions); the debit valuation adjustments ("DVA") taken on derivative and structured liabilities to reflect the credit quality of the Firm; the MSR portfolio; and securities and instruments held by corporate functions, such as Corporate/Private Equity. See the DVA Sensitivity table on page 115 of this Annual Report for further details. For a discussion of MSRs and the corporate functions, see Note 4 on pages 141–155, Note 18 on pages 198–201 and Corporate/ Private Equity on pages 73–75 of this Annual Report.



2008 VaR results

IB's average total trading and credit portfolio VaR was $202 million for 2008, compared with $106 million for 2007, and includes the positions from the Bear Stearns merger since May 31, 2008. The increase in average and maximum VaR during 2008 compared with the prior year was primarily due to increased volatility across virtually all asset classes. In addition, increased hedges of positions not specifically captured in VaR – for example, macro hedge strategies that have been deployed to mitigate the consequences of a systemic risk event and hedges of loans held-for-sale – significantly increased the VaR compared with the prior period.

For 2008, compared with the prior year, average trading VaR diversification increased to $108 million from $77 million, reflecting the impact of the Bear Stearns merger. In general, over the course of the year, VaR exposures can vary significantly as positions change, market volatility fluctuates and diversification benefits change.

VaR backtesting

To evaluate the soundness of its VaR model, the Firm conducts daily back-testing of VaR against daily IB market risk-related revenue, which is defined as the change in value of principal transactions revenue (less Private Equity gains/losses) plus any trading-related net interest income, brokerage commissions, underwriting fees or other revenue. The daily IB market risk-related revenue excludes gains and losses on held-for-sale funded loans and unfunded commitments and from DVA. The following histogram illustrates the daily market risk-related gains and losses for IB trading businesses for the year ended 2008. The chart shows that IB posted market risk-related gains on 165 of the 262 days in this period, with 54 days exceeding $120 million. The inset graph looks at those days on which IB experienced losses and depicts the amount by which 99% confidence level VaR exceeded the actual loss on each of those days. During the year ended December 31, 2008, losses were sustained on 97 days; losses exceeded the VaR measure on three of those days compared with eight days for the year ended 2007. The Firm would expect to incur losses greater than those predicted by the 99% confidence level VaR estimates once in every 100 trading days, or about two to three times a year.

(a) Includes seven months of Bear Stearns results.

95% Confidence Level VaR

Total IB trading VaR by risk type, credit portfolio VaR and other VaR

	Six months ended December 31, 2008	
(in millions)	Average	At December 31
IB VaR by risk type:		
Fixed income	$ 162	$ 180
Foreign exchange	23	38
Equities	47	39
Commodities and other	23	25
Diversification benefit to IB trading VaR	(88)	(108)
IB Trading VaR	$ 167	$ 174
Credit portfolio VaR	45	77
Diversification benefit to IB trading and credit portfolio VaR	(36)	(57)
Total IB trading and credit portfolio VaR	$ 176	$ 194
Consumer Lending VaR	37	112
Corporate Risk Management VaR	48	114
Diversification benefit to total other VaR	(19)	(48)
Total other VaR	$ 66	$ 178
Diversification benefit to total IB and other VaR	(40)	(86)
Total IB and other VaR	$ 202	$ 286

The Firm's new 95% VaR measure includes all the risk positions taken into account under the 99% confidence level VaR measure, as well as syndicated lending facilities the Firm intends to distribute (and, beginning in the fourth quarter of 2008, the credit spread sensitivities of certain mortgage products). The Firm utilizes proxies to estimate the VaR for these mortgage and credit products since daily time series are largely not available. In addition, the new VaR measure includes certain actively managed positions utilized as part of the Firm's risk management function within Corporate and in the Consumer Lending businesses to provide a total IB and other VaR

measure. In the Firm's view, including these items in VaR produces a more complete perspective of the Firm's risk profile for items with market risk that can impact the income statement. The Consumer Lending VaR includes the Firm's mortgage pipeline and warehouse loans, MSRs and all related hedges.

The revised VaR measure continues to exclude the DVA taken on derivative and structured liabilities to reflect the credit quality of the Firm. It also excludes certain nontrading activity such as Private Equity, principal investing (e.g., mezzanine financing, tax-oriented investments, etc.) and Corporate balance sheet and capital management positions, as well as longer-term corporate investments. Corporate positions are managed through the Firm's earnings-at-risk and other cash flow monitoring processes rather than by using a VaR measure. Nontrading principal investing activities and Private Equity positions are managed using stress and scenario analyses.

Changing to the 95% confidence interval caused the average VaR to drop by $85 million in the third quarter when the new measure was implemented. Under the 95% confidence interval, the Firm would expect to incur daily losses greater than those predicted by VaR estimates about twelve times a year.

The following table provides information about the sensitivity of DVA to a one basis point increase in JPMorgan Chase's credit spreads. The sensitivity of DVA at December 31, 2008, represents the Firm (including Bear Stearns), while the sensitivity of DVA for December 31, 2007, represents heritage JPMorgan Chase only.

Debit Valuation Adjustment Sensitivity

(in millions)	1 Basis Point Increase in JPMorgan Chase Credit Spread
December 31, 2008	**$ 32**
December 31, 2007	$ 38

Loss advisories and drawdowns

Loss advisories and drawdowns are tools used to highlight to senior management trading losses above certain levels and initiate discussion of remedies.

Economic value stress testing

While VaR reflects the risk of loss due to adverse changes in normal markets, stress testing captures the Firm's exposure to unlikely but plausible events in abnormal markets. The Firm conducts economic value stress tests for both its trading and nontrading activities at least every two weeks using multiple scenarios that assume credit spreads widen significantly, equity prices decline and interest rates rise in the major currencies. Additional scenarios focus on the risks predominant in individual business segments and include scenarios that focus on the potential for adverse moves in complex portfolios. Periodically, scenarios are reviewed and updated to reflect changes in the Firm's risk profile and economic events. Along with VaR, stress testing is important in measuring and controlling risk. Stress testing enhances the understanding of the Firm's risk profile and loss potential, and stress losses are monitored against limits. Stress testing is also utilized in one-off approvals and cross-business risk measurement, as well as an input to economic capital allocation. Stress-test results, trends and explanations are provided at least every two weeks to the Firm's senior management and to the lines of business to help them better measure and manage risks and understand event risk-sensitive positions.

Earnings-at-risk stress testing

The VaR and stress-test measures described above illustrate the total economic sensitivity of the Firm's balance sheet to changes in market variables. The effect of interest rate exposure on reported net income is also important. Interest rate risk exposure in the Firm's core nontrading business activities (i.e., asset/liability management positions) results from on- and off-balance sheet positions and can occur due to a variety of factors, including:

- Differences in the timing among the maturity or repricing of assets, liabilities and off-balance sheet instruments. For example, if liabilities reprice quicker than assets and funding interest rates are declining, earnings will increase initially.
- Differences in the amounts of assets, liabilities and off-balance sheet instruments that are repricing at the same time. For example, if more deposit liabilities are repricing than assets when general interest rates are declining, earnings will increase initially.
- Differences in the amounts by which short-term and long-term market interest rates change. For example, changes in the slope of the yield curve because the Firm has the ability to lend at long-term fixed rates and borrow at variable or short-term fixed rates. Based upon these scenarios, the Firm's earnings would be affected negatively by a sudden and unanticipated increase in short-term rates paid on its liabilities (e.g., deposits) without a corresponding increase in long-term rates received on its assets (e.g., loans). Conversely, higher long-term rates received on assets generally are beneficial to earnings, particularly when the increase is not accompanied by rising short-term rates paid on liabilities.
- The impact of changes in the maturity of various assets, liabilities or off-balance sheet instruments as interest rates change. For example, if more borrowers than forecasted pay down higher rate loan balances when general interest rates are declining, earnings may decrease initially.

The Firm manages interest rate exposure related to its assets and liabilities on a consolidated, corporate-wide basis. Business units transfer their interest rate risk to Treasury through a transfer-pricing system, which takes into account the elements of interest rate exposure that can be risk-managed in financial markets. These elements include asset and liability balances and contractual rates of interest, contractual principal payment schedules, expected prepayment experience, interest rate reset dates and maturities, rate indices used for re-pricing, and any interest rate ceilings or floors for adjustable rate products. All transfer-pricing assumptions are dynamically reviewed.

The Firm conducts simulations of changes in net interest income from its nontrading activities under a variety of interest rate scenarios. Earnings-at-risk tests measure the potential change in the Firm's net interest income, and the corresponding impact to the Firm's pre-

tax earnings, over the following 12 months. These tests highlight exposures to various rate-sensitive factors, such as the rates themselves (e.g., the prime lending rate), pricing strategies on deposits, optionality and changes in product mix. The tests include forecasted balance sheet changes, such as asset sales and securitizations, as well as prepayment and reinvestment behavior.

Immediate changes in interest rates present a limited view of risk, and so a number of alternative scenarios are also reviewed. These scenarios include the implied forward curve, nonparallel rate shifts and severe interest rate shocks on selected key rates. These scenarios are intended to provide a comprehensive view of JPMorgan Chase's earnings-at-risk over a wide range of outcomes.

JPMorgan Chase's 12-month pretax earnings sensitivity profile as of December 31, 2008 and 2007, is as follows.

	Immediate change in rates			
(in millions)	+200bp	+100bp	-100bp	-200bp
December 31, 2008	**$ 336**	**$ 672**	**$ NM**[a]	**$ NM**[a]
December 31, 2007	$ (26)	$ 55	$ (308)	$ (664)

(a) Down 100 and 200 basis point parallel shocks result in a Fed Funds target rate of zero, and negative three- and six-month Treasury rates. The earnings-at-risk results of such a low probability scenario are not meaningful ("NM").

The change in earnings-at-risk from December 31, 2007, results from a higher level of AFS securities and lower market interest rates. The benefit to the Firm of an increase in rates results from a widening of deposit margins which are currently compressed due to very low short-term interest rates. This benefit would be partially offset by the effect of reduced mortgage prepayments. The impact to the Firm's pretax earnings of reduced mortgage prepayments would become more pronounced under a +200 bp parallel shock.

Additionally, another sensitivity involving a steeper yield curve, with long-term rates rising 100 basis points and short-term rates staying at current levels, results in a 12-month pretax earnings benefit of $740 million. The increase in earnings is due to reinvestment of maturing assets at the higher long-term rates with funding costs remaining unchanged.

Risk identification for large exposures ("RIFLE")
Individuals who manage risk positions, particularly those that are complex, are responsible for identifying potential losses that could arise from specific, unusual events, such as a potential tax change, and estimating the probabilities of losses arising from such events. This information is entered into the Firm's RIFLE database. Management of trading businesses control RIFLE entries, thereby permitting the Firm to monitor further earnings vulnerability not adequately covered by standard risk measures.

Risk monitoring and control

Limits
Market risk is controlled primarily through a series of limits. Limits reflect the Firm's risk appetite in the context of the market environment and business strategy. In setting limits, the Firm takes into consideration factors such as market volatility, product liquidity, business trends and management experience.

Market risk management regularly reviews and updates risk limits. Senior management, including the Firm's Chief Executive Officer and Chief Risk Officer, is responsible for reviewing and approving risk limits at least once a year.

The Firm maintains different levels of limits. Corporate-level limits include VaR and stress limits. Similarly, line-of-business limits include VaR and stress limits and may be supplemented by loss advisories, nonstatistical measurements and instrument authorities. Businesses are responsible for adhering to established limits, against which exposures are monitored and reported. Limit breaches are reported in a timely manner to senior management, and the affected business segment is required to reduce trading positions or consult with senior management on the appropriate action.

Qualitative review
The Market Risk Management group also performs periodic reviews as necessary of both businesses and products with exposure to market risk to assess the ability of the businesses to control their market risk. Strategies, market conditions, product details and risk controls are reviewed, and specific recommendations for improvements are made to management.

Model review
Some of the Firm's financial instruments cannot be valued based upon quoted market prices but are instead valued using pricing models. Such models are used for management of risk positions, such as reporting against limits, as well as for valuation. The Model Risk Group, independent of the businesses and market risk management, reviews the models the Firm uses and assesses model appropriateness and consistency. The model reviews consider a number of factors about the model's suitability for valuation and risk management of a particular product, including whether it accurately reflects the characteristics of the transaction and its significant risks, the suitability and convergence properties of numerical algorithms, reliability of data sources, consistency of the treatment with models for similar products, and sensitivity to input parameters and assumptions that cannot be priced from the market.

Reviews are conducted of new or changed models, as well as previously accepted models, to assess whether there have been any changes in the product or market that may impact the model's validity and whether there are theoretical or competitive developments that may require reassessment of the model's adequacy. For a summary of valuations based upon models, see Critical Accounting Estimates Used by the Firm on pages 119–123 of this Annual Report.

Risk reporting

Nonstatistical exposures, value-at-risk, loss advisories and limit excesses are reported daily for each trading and nontrading business. Market risk exposure trends, value-at-risk trends, profit and loss changes, and portfolio concentrations are reported weekly. Stress-test results are reported at least every two weeks to business and senior management.

PRIVATE EQUITY RISK MANAGEMENT

Risk management

The Firm makes direct principal investments in private equity. The illiquid nature and long-term holding period associated with these investments differentiates private equity risk from the risk of positions held in the trading portfolios. The Firm's approach to managing private equity risk is consistent with the Firm's general risk governance structure. Controls are in place establishing expected levels for total and annual investment in order to control the overall size of the portfolio. Industry and geographic concentration limits are in place and intended to ensure diversification of the portfolio. All investments are approved by an investment committee that includes executives who are not part of the investing businesses. An independent valuation function is responsible for reviewing the appropriateness of the carrying values of private equity investments in accordance with relevant accounting policies. At December 31, 2008 and 2007, the carrying value of the private equity businesses was $6.9 billion and $7.2 billion, respectively, of which $483 million and $390 million, respectively, represented publicly traded positions. For further information on the Private equity portfolio, see page 75 of this Annual Report.

OPERATIONAL RISK MANAGEMENT

Operational risk is the risk of loss resulting from inadequate or failed processes or systems, human factors or external events.

Overview

Operational risk is inherent in each of the Firm's businesses and support activities. Operational risk can manifest itself in various ways, including errors, fraudulent acts, business interruptions, inappropriate behavior of employees, or vendors that do not perform in accordance with their arrangements. These events could result in financial losses and other damage to the Firm, including reputational harm.

To monitor and control operational risk, the Firm maintains a system of comprehensive policies and a control framework designed to provide a sound and well-controlled operational environment. The goal is to keep operational risk at appropriate levels, in light of the Firm's financial strength, the characteristics of its businesses, the markets in which it operates, and the competitive and regulatory environment to which it is subject. Notwithstanding these control measures, the Firm incurs operational losses.

The Firm's approach to operational risk management is intended to mitigate such losses by supplementing traditional control-based approaches to operational risk with risk measures, tools and disciplines that are risk-specific, consistently applied and utilized firmwide. Key themes are transparency of information, escalation of key issues and accountability for issue resolution.

The Firm's operational risk framework is supported by Phoenix, an internally designed operational risk software tool. Phoenix integrates the individual components of the operational risk management framework into a unified, web-based tool. Phoenix enhances the capture, reporting and analysis of operational risk data by enabling risk identification, measurement, monitoring, reporting and analysis to be done in an integrated manner, thereby enabling efficiencies in the Firm's monitoring and management of its operational risk.

For purposes of identification, monitoring, reporting and analysis, the Firm categorizes operational risk events as follows:

- Client service and selection
- Business practices
- Fraud, theft and malice
- Execution, delivery and process management
- Employee disputes
- Disasters and public safety
- Technology and infrastructure failures

Risk identification and measurement

Risk identification is the recognition of the operational risk events that management believes may give rise to operational losses. All businesses utilize the Firm's standard self-assessment process and supporting architecture as a dynamic risk management tool. The goal of the self-assessment process is for each business to identify the key operational risks specific to its environment and assess the degree to which it maintains appropriate controls. Action plans are developed for control issues identified, and businesses are held accountable for tracking and resolving these issues on a timely basis.

Risk monitoring

The Firm has a process for monitoring operational risk-event data, permitting analysis of errors and losses as well as trends. Such analysis, performed both at a line-of-business level and by risk-event type, enables identification of the causes associated with risk events faced by the businesses. Where available, the internal data can be supplemented with external data for comparative analysis with industry patterns. The data reported enables the Firm to back-test against self-assessment results. The Firm is a founding member of the Operational Riskdata eXchange Association, a not-for-profit industry association formed for the purpose of collecting operational loss data, sharing data in an anonymous form and benchmarking results back to members. Such information supplements the Firm's ongoing operational risk measurement and analysis.

Risk reporting and analysis
Operational risk management reports provide timely and accurate information, including information about actual operational loss levels and self-assessment results, to the lines of business and senior management. The purpose of these reports is to enable management to maintain operational risk at appropriate levels within each line of business, to escalate issues and to provide consistent data aggregation across the Firm's businesses and support areas.

Audit alignment
Internal Audit utilizes a risk-based program of audit coverage to provide an independent assessment of the design and effectiveness of key controls over the Firm's operations, regulatory compliance and reporting. This includes reviewing the operational risk framework, the effectiveness and accuracy of the business self-assessment process and the loss data collection and reporting activities.

REPUTATION AND FIDUCIARY RISK MANAGEMENT

A firm's success depends not only on its prudent management of the liquidity, credit, market and operational risks that are part of its business risks, but equally on the maintenance among many constituents – clients, investors, regulators, as well as the general public – of a reputation for business practices of the highest quality. Attention to reputation always has been a key aspect of the Firm's practices, and maintenance of the Firm's reputation is the responsibility of everyone at the Firm. JPMorgan Chase bolsters this individual responsibility in many ways, including through the Firm's Code of Conduct, training, maintaining adherence to policies and procedures, and oversight functions that approve transactions. These oversight functions include a Conflicts Office, which examines wholesale transactions with the potential to create conflicts of interest for the Firm, and regional reputation risk review committees, which review certain transactions with clients, especially complex derivatives and structured finance transactions, that have the potential to affect adversely the Firm's reputation. These regional committees, whose members are senior representatives of businesses and control functions in the region, focus on the purpose and effect of the transactions from the client's point of view, with the goal that these transactions are not used to mislead investors or others.

Fiduciary risk management
The risk management committees within each line of business include in their mandate the oversight of the legal, reputational and, where appropriate, fiduciary risks in their businesses that may produce significant losses or reputational damage. The Fiduciary Risk Management function works with the relevant line-of-business risk committees with the goal of ensuring that businesses providing investment or risk management products or services that give rise to fiduciary duties to clients perform at the appropriate standard relative to their fiduciary relationship with a client. Of particular focus are the policies and practices that address a business' responsibilities to a client, including client suitability determination; disclosure obligations and communications; and performance expectations with respect to risk management products or services being provided. In this way, the relevant line-of-business risk committees, together with the Fiduciary Risk Management function, provide oversight of the Firm's efforts to monitor, measure and control the risks that may arise in the delivery of the products or services to clients that give rise to such fiduciary duties, as well as those stemming from any of the Firm's fiduciary responsibilities to employees under the Firm's various employee benefit plans.

CRITICAL ACCOUNTING ESTIMATES USED BY THE FIRM

JPMorgan Chase's accounting policies and use of estimates are integral to understanding its reported results. The Firm's most complex accounting estimates require management's judgment to ascertain the value of assets and liabilities. The Firm has established detailed policies and control procedures intended to ensure that valuation methods, including any judgments made as part of such methods, are well-controlled, independently reviewed and applied consistently from period to period. In addition, the policies and procedures are intended to ensure that the process for changing methodologies occurs in an appropriate manner. The Firm believes its estimates for determining the value of its assets and liabilities are appropriate. The following is a brief description of the Firm's critical accounting estimates involving significant valuation judgments.

Allowance for credit losses

JPMorgan Chase's allowance for credit losses covers the wholesale and consumer loan portfolios, as well as the Firm's portfolio of lending-related commitments. The allowance for credit losses is intended to adjust the value of the Firm's loan assets for probable credit losses as of the balance sheet date. For further discussion of the methodologies used in establishing the Firm's allowance for credit losses, see Note 15 on pages 178–180 of this Annual Report.

Wholesale loans and lending-related commitments

The methodology for calculating both the allowance for loan losses and the allowance for lending-related commitments involves significant judgment. First and foremost, it involves the early identification of credits that are deteriorating. Second, it involves judgment in establishing the inputs used to estimate the allowances. Third, it involves management judgment to evaluate certain macroeconomic factors, underwriting standards, and other relevant internal and external factors affecting the credit quality of the current portfolio and to refine loss factors to better reflect these conditions.

The Firm uses a risk-rating system to determine the credit quality of its wholesale loans. Wholesale loans are reviewed for information affecting the obligor's ability to fulfill its obligations. In assessing the risk rating of a particular loan, among the factors considered are the obligor's debt capacity and financial flexibility, the level of the obligor's earnings, the amount and sources for repayment, the level and nature of contingencies, management strength and the industry and geography in which the obligor operates. These factors are based upon an evaluation of historical and current information, and involve subjective assessment and interpretation. Emphasizing one factor over another or considering additional factors could impact the risk rating assigned by the Firm to that loan.

The Firm applies its judgment to establish loss factors used in calculating the allowances. Wherever possible, the Firm uses independent, verifiable data or the Firm's own historical loss experience in its models for estimating the allowances. Many factors can affect estimates of loss, including volatility of loss given default, probability of default and rating migrations. Consideration is given as to whether the loss estimates should be calculated as an average over the entire credit cycle or at a particular point in the credit cycle, as well as to which external data should be used and when they should be used. Choosing data that are not reflective of the Firm's specific loan portfolio characteristics could also affect loss estimates. The application of different inputs would change the amount of the allowance for credit losses determined appropriate by the Firm.

Management also applies its judgment to adjust the loss factors derived, taking into consideration model imprecision, external factors and economic events that have occurred but are not yet reflected in the loss factors by establishing ranges using historical experience of both loss given default and probability of default. Factors related to concentrated and deteriorating industries also are incorporated where relevant. These estimates are based upon management's view of uncertainties that relate to current macroeconomic and political conditions, quality of underwriting standards and other relevant internal and external factors affecting the credit quality of the current portfolio.

As noted on page 96 of this Annual Report, the Firm's wholesale allowance is sensitive to the risk rating assigned to a loan. Assuming a one-notch downgrade in the Firm's internal risk ratings for its entire wholesale portfolio, the allowance for loan losses for the wholesale portfolio would increase by approximately $1.8 billion as of December 31, 2008. This sensitivity analysis is hypothetical. In the Firm's view, the likelihood of a one-notch downgrade for all wholesale loans within a short timeframe is remote. The purpose of this analysis is to provide an indication of the impact of risk ratings on the estimate of the allowance for loan losses for wholesale loans. It is not intended to imply management's expectation of future deterioration in risk ratings. Given the process the Firm follows in determining the risk ratings of its loans, management believes the risk ratings currently assigned to wholesale loans are appropriate.

Consumer loans and lending-related commitments

The allowance for credit losses for the consumer portfolio is sensitive to changes in the economic environment, delinquency status, credit bureau scores, the realizable value of collateral, borrower behavior and other risk factors, and is intended to represent management's best estimate of incurred losses as of the balance sheet date. The credit performance of the consumer portfolio across the entire consumer credit product spectrum continues to be negatively affected by the economic environment, as the weak labor market and weak overall economic conditions have resulted in increased delinquencies, while continued weak housing prices have driven a significant increase in loss severity. Significant judgment is required to estimate the duration and severity of the current economic downturn, as well as its potential impact on housing prices and the labor market. While the allowance for credit losses is highly sensitive to both home prices and unemployment rates, in the current market it is difficult to estimate how potential changes in one or both of these factors might impact the allowance for credit losses. For example, while both factors are important determinants of overall allowance levels, changes in one factor or the other may not occur at the same rate, or changes may be directionally inconsistent such that improvement in one factor

may offset deterioration in the other. In addition, changes in these factors would not necessarily be consistent across geographies or product types. Finally, it is difficult to predict the extent to which changes in both or either of these factors will ultimately impact the frequency of losses, the severity of losses, or both, and overall loss rates are a function of both the frequency and severity of individual loan losses.

The allowance is calculated by applying statistical loss factors and other risk indicators to pools of loans with similar risk characteristics to arrive at an estimate of incurred losses in the portfolio. Management applies judgment to the statistical loss estimates for each loan portfolio category using delinquency trends and other risk characteristics to estimate charge-offs. Management utilizes additional statistical methods and considers portfolio and collateral valuation trends to review the appropriateness of the primary statistical loss estimate.

The statistical calculation is adjusted to take into consideration model imprecision, external factors and current economic events that have occurred but are not yet reflected in the factors used to derive the statistical calculation, and is accomplished in part by analyzing the historical loss experience for each major product segment. In the current economic environment, it is difficult to predict whether historical loss experience is indicative of future loss levels. Management applies judgment within estimated ranges in determining this adjustment, taking into account the numerous uncertainties inherent in the current economic environment. The estimated ranges and the determination of the appropriate point within the range are based upon management's judgment related to uncertainties associated with current macroeconomic and political conditions, quality of underwriting standards, and other relevant internal and external factors affecting the credit quality of the portfolio.

Fair value of financial instruments, MSRs and commodities inventory

JPMorgan Chase carries a portion of it assets and liabilities at fair value. The majority of such assets and liabilities are carried at fair value on a recurring basis. In addition, certain assets are carried at fair value on a nonrecurring basis, including loans accounted for at the lower of cost or fair value that are only subject to fair value adjustments under certain circumstances.

On January 1, 2007, the Firm adopted SFAS 157, which established a three-level valuation hierarchy for disclosure of fair value measurements. An instrument's categorization within the hierarchy is based upon the lowest level of input that is significant to the fair value measurement. Therefore, for instruments classified in levels 1 and 2 of the hierarchy, where inputs are principally based on observable market data, there is less judgment applied in arriving at a fair value measurement. For instruments classified within level 3 of the hierarchy, judgments are more significant. The Firm reviews and updates the fair value hierarchy classifications on a quarterly basis. Changes from one quarter to the next related to the observability of inputs to a fair value measurement may result in a reclassification between hierarchy levels.

Assets carried at fair value

The table that follows includes the Firm's assets carried at fair value and the portion of such assets that are classified within level 3 of the valuation hierarchy.

December 31,	2008		2007	
(in billions)	Total at fair value	Level 3 total	Total at fair value	Level 3 total
Trading debt and equity securities[a]	**$ 347.4**	**$ 41.4**	$ 414.3	$ 24.1
Derivative receivables – gross	**2,741.7**	**53.0**	909.8	20.2
Netting adjustment	**(2,579.1)**	**—**	(832.7)	—
Derivative receivables – net	**162.6**	**53.0**[e]	77.1	20.2[e]
AFS Securities	**205.9**	**12.4**	85.4	0.1
Loans	**7.7**	**2.7**	8.7	8.4
MSRs	**9.4**	**9.4**	8.6	8.6
Private equity investments	**6.9**	**6.4**	7.2	6.8
Other[b]	**46.5**	**5.0**	34.2	3.1
Total assets carried at fair value on a recurring basis	**786.4**	**130.3**	635.5	71.3
Total assets carried at fair value on a nonrecurring basis[c]	**11.0**	**4.3**	14.9	11.8
Total assets carried at fair value	**$ 797.4**	**$ 134.6**[f]	$ 650.4	$ 83.1
Less: level 3 assets for which the Firm does not bear economic exposure[d]		**21.2**		
Total level 3 assets for which the Firm bears economic exposure		**$ 113.4**		
Total Firm assets	**$ 2,175.1**		$ 1,562.1	
Level 3 assets as a percentage of total Firm assets		**6%**		5%
Level 3 assets for which the Firm bears economic exposure as a percentage of total Firm assets		**5**		
Level 3 assets as a percentage of total Firm assets at fair value		**17**		13
Level 3 assets for which the Firm bears economic exposure as a percentage of total assets at fair value		**14**		

(a) Includes physical commodities carried at the lower of cost or fair value.
(b) Includes certain securities purchased under resale agreements, certain securities borrowed and certain other investments.
(c) Predominantly consists of debt financing and other loan warehouses held-for-sale and other assets.
(d) Balances for which the Firm did not bear economic exposure at December 31, 2007, were not significant.
(e) The Firm does not allocate the FIN 39 netting adjustment across the levels of the fair value hierarchy. As such, the level 3 derivative receivables balance included in the level 3 total balance is reported gross of any netting adjustments.
(f) Included in the table above are $95.1 billion of level 3 assets, consisting of recurring and nonrecurring assets, carried by IB at December 31, 2008. This includes $21.2 billion of assets for which the Firm serves as an intermediary between two parties and does not bear economic exposure.

Valuation

For instruments classified within level 3 of the hierarchy, judgments may be significant. In arriving at an estimate of fair value for an instrument within level 3, management must first determine the appropriate model to use. Second, due to the lack of observability of significant inputs, management must assess all relevant empirical data in deriving valuation inputs including but not limited to yield curves, interest rates, volatilities, equity or debt prices, foreign exchange rates and credit curves. In addition to market information, models also incorporate transaction details, such as maturity. Finally, management judgment must be applied to assess the appropriate level of valuation adjustments to reflect counterparty credit quality, the Firm's creditworthiness, constraints on liquidity and unobservable parameters, where relevant. The judgments made are typically affected by the type of product and its specific contractual terms and the level of liquidity for the product or within the market as a whole.

Imprecision in estimating unobservable market inputs can impact the amount of revenue or loss recorded for a particular position. Furthermore, while the Firm believes its valuation methods are appropriate and consistent with those of other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different estimate of fair value at the reporting date. For a detailed discussion of the determination of fair value for individual financial instruments, see Note 4 on pages 141–145 of this Annual Report. In addition, for a further discussion of the significant judgments and estimates involved in the determination of the Firm's mortgage-related exposures, see "Mortgage-related exposures carried at fair value" in Note 4 on pages 151–153 of this Annual Report.

Purchased credit-impaired loans

JPMorgan Chase acquired, in connection with the Washington Mutual transaction, certain loans with evidence of deterioration of credit quality since origination and for which it was probable, at acquisition, that the Firm would be unable to collect all contractually required payments receivable. These purchased credit-impaired loans are accounted for in accordance with SOP 03-3. Many of the assumptions and estimates underlying the application of SOP 03-3 are both significant and judgmental, particularly considering the current economic environment. The level of future home price declines, the duration and severity of the current economic downturn and the lack of market liquidity and transparency are factors that have impacted and may continue to impact these assumptions and estimates.

Determining which loans are included in the scope of SOP 03-3 is highly subjective and requires the application of significant judgment. In the Washington Mutual transaction, consumer loans with certain attributes (e.g., higher loan-to-value ratios, borrowers with lower FICO scores, delinquencies) were determined to be credit-impaired, provided that those attributes arose subsequent to loan origination. Wholesale loans were determined to be credit-impaired if they met the definition of an impaired loan under SFAS 114 at the acquisition date. Applying SOP 03-3 to the appropriate population of loans is important because loans that are not within the scope of SOP 03-3 are subject to different accounting standards. Choosing different attributes in making the management assessment of which loans were credit-impaired and within the scope of SOP 03-3 could have resulted in a different (i.e., larger or smaller) population of loans deemed credit-impaired at the transaction date.

Loans determined to be within the scope of SOP 03-3 are initially recorded at fair value. The Firm has estimated the fair value of these loans by discounting the cash flows expected to be collected at a market observable discount rate, when available, adjusted for factors that a market participant would consider in determining fair value. The initial estimate of cash flows expected to be collected entails significant management judgment, as such cash flows were derived from assumptions such as default rates, loss severities and the amount and timing of prepayments. Particularly in the current economic environment, estimating the initial fair value of these loans was highly subjective. The application of different assumptions by management would have resulted in different initial fair values.

The Firm has elected to aggregate the purchased credit-impaired consumer loans into pools of loans with common risk characteristics. Significant judgment is required in evaluating whether individual loans have common risk characteristics for purposes of establishing these pools. Each resulting pool is considered one loan with a composite interest rate and estimation of cash flows expected to be collected for purposes of applying SOP 03-3 subsequent to acquisition. The process of estimating cash flows expected to be collected subsequent to acquisition is both subjective and judgmental and may have an impact on the recognition and measurement of impairment losses and/or interest income. In addition, the decision to pool these loans and the manner in which they were pooled may have an impact on the recognition, measurement and/or classification of interest income and/or impairment losses.

Goodwill impairment

Under SFAS 142, goodwill must be allocated to reporting units and tested for impairment. SFAS 142 defines reporting units of an entity as either SFAS 131 operating segments (i.e., one level below the SFAS 131 reportable segments as disclosed in Note 37 of this Annual Report) or one level below the SFAS 131 operating segments. JPMorgan Chase generally determined its reporting units to be one level below the six major business segments identified in Note 37 on pages 226–227 of this Annual Report, plus Private Equity which is included in Corporate. This determination was based on how the Firm's operating segments are managed and how they are reviewed by the Firm's Operating Committee.

The Firm tests goodwill for impairment at least annually or more frequently if events or circumstances, such as adverse changes in the business climate, indicate that there may be justification for conducting an interim test. The first part of the test is a comparison, at the reporting unit level, of the fair value of each reporting unit to its carrying amount, including goodwill. If the fair value is less than the carrying value, then the second part of the test is needed to measure the amount of potential goodwill impairment. The implied fair value of the reporting unit goodwill is calculated and compared with the carrying amount of goodwill recorded in the Firm's financial records. If the carrying value of the reporting unit goodwill exceeds the implied fair value of that goodwill, then the Firm would recognize an impairment loss in the amount of the difference, which would be recorded as a charge against net income.

If the fair value of the reporting unit in the first part of the test is determined to be greater than the carrying amount of the reporting unit including goodwill, then and in accordance with SFAS 142 goodwill is deemed not to be impaired. During the fourth quarter of 2008, the Firm performed its annual goodwill impairment testing and concluded that the fair value of each of its reporting units was in excess of their respective carrying values including goodwill. Accordingly, the Firm concluded that its goodwill was not impaired at December 31, 2008.

The Firm considers discounted cash flow models to be its primary method of determining the fair value of its reporting units. The models project levered cash flows for five years and use the perpetuity growth method to calculate terminal values. The first year's projected cash flows are based on the reporting units' internal budget forecasts for the upcoming calendar year (which are reviewed with the Operating Committee of the Firm). To assess the reasonableness of the valuations derived from the discounted cash flow models, the Firm also analyzes market-based trading and transaction multiples, where available. These trading and transaction comparables are used to assess the reasonableness of the estimated fair values, as observable market information is generally not available.

JPMorgan Chase's stock price, consistent with stock prices in the broader financial services sector, declined significantly during the last half of 2008. JPMorgan Chase's market capitalization fell below its recorded book value, principally during the fourth quarter of 2008. Although the Firm believes it is reasonable to conclude that market capitalization could be an indicator of fair value over time, the Firm is of the view that short-term fluctuations in market capitalization do not reflect the long-term fair value of its reporting units.

Management applies significant judgment when determining the fair value of its reporting units. Imprecision in estimating the future cash flows of the Firm's reporting units as well as the appropriate cost of equity used to discount those cash flows can impact their estimated fair values. If JPMorgan Chase's common stock were to trade at the level it was at the end of 2008 over a sustained period and weak economic market conditions persist, these factors could indicate that the long-term earnings potential of the Firm's reporting units could be adversely affected – which could result in supplemental impairment testing during interim reporting periods and possible impairment of goodwill in the future.

Income taxes

JPMorgan Chase is subject to the income tax laws of the various jurisdictions in which it operates, including U.S. federal, state and non-U.S. jurisdictions. These laws are often complex and may be subject to different interpretations. To determine the financial statement impact of its accounting for income taxes, including the provision for income tax expense and its unrecognized tax benefits, JPMorgan Chase must make assumptions and judgments about how to interpret and apply these complex tax laws to numerous transactions and business events. Disputes over interpretations with the various taxing authorities may be settled upon audit or administrative appeals. In some cases, the Firm's interpretations of tax laws may be subject to adjudication by the court systems of the tax jurisdictions in which it operates. JPMorgan Chase regularly reviews whether the Firm may be assessed additional income taxes as a result of the resolution of these matters, and the Firm records additional reserves as appropriate.

The Firm does not anticipate that current market events will adversely impact the realizability of its deferred tax assets.

The Firm adjusts its unrecognized tax benefits as necessary when additional information becomes available. The reassessment of JPMorgan Chase's unrecognized tax benefits may have a material impact on its effective tax rate in the period in which it occurs.

ACCOUNTING AND REPORTING DEVELOPMENTS

Derivatives netting – amendment of FASB Interpretation No. 39

In April 2007, the FASB issued FSP FIN 39-1, which permits offsetting of cash collateral receivables or payables with net derivative positions under certain circumstances. The Firm adopted FSP FIN 39-1 effective January 1, 2008. The FSP did not have a material impact on the Firm's Consolidated Balance Sheets.

Accounting for income tax benefits of dividends on share-based payment awards

In June 2007, the FASB ratified EITF 06-11, which must be applied prospectively for dividends declared in fiscal years beginning after December 15, 2007. EITF 06-11 requires that realized tax benefits from dividends or dividend equivalents paid on equity-classified share-based payment awards that are charged to retained earnings be recorded as an increase to additional paid-in capital and included in the pool of excess tax benefits available to absorb tax deficiencies on share-based payment awards. Prior to the issuance of EITF 06-11, the Firm did not include these tax benefits as part of this pool of excess tax benefits. The Firm adopted EITF 06-11 on January 1, 2008. The adoption of this consensus did not have an impact on the Firm's Consolidated Balance Sheets or results of operations.

Fair value measurements – written loan commitments

In November 2007, the SEC issued SAB 109, which revises and rescinds portions of SAB 105. Specifically, SAB 109 states that the expected net future cash flows related to the associated servicing of the loan should be included in the measurement of all written loan commitments that are accounted for at fair value through earnings. The provisions of SAB 109 are applicable to written loan commitments issued or modified beginning on January 1, 2008. The Firm adopted SAB 109 on January 1, 2008. The adoption of this pronouncement did not have a material impact on the Firm's Consolidated Balance Sheets or results of operations.

Business combinations/noncontrolling interests in consolidated financial statements

In December 2007, the FASB issued SFAS 141R and SFAS 160, which amend the accounting and reporting of business combinations, as well as noncontrolling (i.e., minority) interests. For JPMorgan Chase, SFAS 141R is effective for business combinations that close on or after January 1, 2009. SFAS 160 is effective for JPMorgan Chase for fiscal years beginning on or after December 15, 2008.

SFAS 141R will generally only impact the accounting for future business combinations and will impact certain aspects of business combination accounting, such as transaction costs and certain merger-related restructuring reserves, as well as the accounting for partial acquisitions where control is obtained by JPMorgan Chase. One exception to the prospective application of SFAS 141R relates to accounting for income taxes associated with business combinations that closed prior to January 1, 2009. Once the purchase accounting measurement period closes for these acquisitions, any further adjustments to income taxes recorded as part of these business combinations will impact income tax expense. Previously, further adjustments were predominately recorded as adjustments to Goodwill. JPMorgan Chase will continue to evaluate the impact that SFAS 141R will have on its consolidated financial statements.

SFAS 160 requires that noncontrolling interests be accounted for and presented as equity, rather than as a liability or mezzanine equity. Changes to how the income statement is presented will also result. SFAS 160 presentation and disclosure requirements are to be applied retrospectively. The adoption of this pronouncement is not expected to have a material impact on the Firm's Consolidated Balance Sheets, results of operations or ratios.

Accounting for transfers of financial assets and repurchase financing transactions

In February 2008, the FASB issued FSP FAS 140-3, which requires an initial transfer of a financial asset and a repurchase financing that was entered into contemporaneously with, or in contemplation of, the initial transfer to be evaluated together as a linked transaction under SFAS 140, unless certain criteria are met. The Firm adopted FSP FAS 140-3 on January 1, 2009, for new transactions entered into after the date of adoption. The adoption of FSP FAS 140-3 is not expected to have a material impact on the Consolidated Balance Sheets or results of operations.

Disclosures about derivative instruments and hedging activities – FASB Statement No. 161

In March 2008, the FASB issued SFAS 161, which amends the disclosure requirements of SFAS 133. SFAS 161 requires increased disclosures about derivative instruments and hedging activities and their effects on an entity's financial position, financial performance and cash flows. SFAS 161 is effective for fiscal years beginning after November 15, 2008, with early adoption permitted. SFAS 161 will only affect JPMorgan Chase's disclosures of derivative instruments and related hedging activities, and not its Consolidated Balance Sheets, Consolidated Statements of Income or Consolidated Statements of Cash Flows.

Determining whether instruments granted in share-based payment transactions are participating securities

In June 2008, the FASB issued FSP EITF 03-6-1, which addresses whether instruments granted in share-based payment transactions are participating securities prior to vesting and, therefore, need to be included in the earnings allocation in computing earnings per share under the two-class method. FSP EITF 03-6-1 is effective for financial statements issued for fiscal years beginning after December 15, 2008, and interim periods within those years. Adoption of FSP EITF 03-6-1 does not affect net income or results of operations but may result in a reduction of basic and/or diluted earnings per share in certain periods.

Disclosures about credit derivatives and certain guarantees

In September 2008, the FASB issued FSP FAS 133-1 and FIN 45-4. The FSP requires enhanced disclosures about credit derivatives and guarantees to address the potential adverse effects of changes in credit risk on the financial position, financial performance and cash flows of the sellers of these instruments. The FSP is effective for reporting periods ending after November 15, 2008, with earlier application permitted. The disclosures required by this FSP are incorporated in this Annual Report. FSP FAS 133-1 and FIN 45-4 only affects JPMorgan Chase's disclosures of credit derivatives and guarantees and not its Consolidated Balance Sheets, Consolidated Statements of Income or Consolidated Statements of Cash Flows.

Determining whether an instrument (or embedded feature) is indexed to an entity's own stock

In September 2008, the EITF issued EITF 07-5, which establishes a two-step process for evaluating whether equity-linked financial instruments and embedded features are indexed to a company's own stock for purposes of determining whether the derivative scope exception in SFAS 133 should be applied. EITF 07-5 is effective for fiscal years beginning after December 2008. The adoption of this EITF is not expected to have a material impact on the Firm's Consolidated Balance Sheets or results of operations.

Accounting for transfers of financial assets and consolidation of variable interest entities

The FASB has been deliberating certain amendments to both SFAS 140 and FIN 46R that may impact the accounting for transactions that involve QSPEs and VIEs. Among other things, the FASB is proposing to eliminate the concept of QSPEs from both SFAS 140 and FIN 46R and make key changes to the consolidation model of FIN 46R that will change the method of determining which party to a VIE should consolidate the VIE. A final standard is expected to be issued in the second quarter of 2009, with an

expected effective date in January 2010. Entities expected to be impacted include revolving securitization entities, bank-administered asset-backed commercial paper conduits, and certain mortgage securitization entities. The Firm is monitoring the FASB's deliberations on these proposed amendments and continues to evaluate their potential impact. The ultimate impact of the Firm will depend upon the guidance issued by the FASB in a final statement amending SFAS 140 and FIN 46R.

Determining the fair value of an asset when the market for that asset is not active

In October 2008, the FASB issued FSP FAS 157-3, which clarifies the application of SFAS 157 in a market that is not active and provides an example to illustrate key considerations in determining the fair value of a financial instrument when the market for that financial asset is not active. The FSP was effective upon issuance, including prior periods for which financial statements have not been issued. The application of this FSP did not have an impact on the Firm's Consolidated Balance Sheets or results of operations.

Disclosure about transfers of financial assets and interests in VIEs

On December 11, 2008, the FASB issued FSP FAS 140-4 and FIN 46(R)-8, which requires additional disclosures relating to transfers of financial assets and interests in securitization entities and other variable interest entities. The purpose of this FSP is to require improved disclosure by public enterprises prior to the effective dates of the proposed amendments to SFAS 140 and FIN 46(R). The effective date for the FSP is for reporting periods (interim and annual) beginning with the first reporting period that ends after December 15, 2008. The disclosures required by this FSP are incorporated in this Annual Report. FSP SFAS 140-4 and FIN 46(R)-8 only affects JPMorgan Chase's disclosure of transfers of financial assets and interests in securitization entities and other variable interest entities and not its Consolidated Balance Sheets, Consolidated Statements of Income or Consolidated Statements of Cash Flows.

Employers' disclosures about postretirement benefit plan assets

In December 2008, the FASB issued FSP FAS 132(R)-1, which requires more detailed disclosures about employers' plan assets, including investment strategies, major categories of plan assets, concentrations of risk within plan assets, and valuation techniques used to measure the fair value of plan assets. This FSP is effective for fiscal years ending after December 15, 2009. The Firm intends to adopt these additional disclosure requirements on the effective date.

Amendments to the impairment guidance of EITF Issue No. 99-20

In January 2009, the FASB issued FSP EITF 99-20-1, which amends the impairment guidance in EITF 99-20 to make the investment security impairment model in EITF 99-20 more consistent with the securities impairment model in SFAS 115. FSP EITF 99-20-1 removes the requirement that a holder's best estimate of cash flows be based exclusively upon those that a market participant would use and allows for reasonable judgment to be applied in considering whether an adverse change in cash flows has occurred based on all available information relevant to the collectibility of the security. FSP EITF 99-20-1 is effective for interim and annual periods ending after December 15, 2008, and therefore the Firm has adopted FSP EITF 99-20-1 as of December 31, 2008. The adoption of this FSP did not have a material impact on the Firm's Consolidated Balance Sheets or results of operations.

NONEXCHANGE-TRADED COMMODITY DERIVATIVE CONTRACTS AT FAIR VALUE

In the normal course of business, JPMorgan Chase trades nonexchange-traded commodity derivative contracts. To determine the fair value of these contracts, the Firm uses various fair value estimation techniques, primarily based upon internal models with significant observable market parameters. The Firm's nonexchange-traded commodity derivative contracts are primarily energy-related.

The following table summarizes the changes in fair value for nonexchange-traded commodity derivative contracts for the year ended December 31, 2008.

For the year ended December 31, 2008 (in millions)	Asset position	Liability position
Net fair value of contracts outstanding at January 1, 2008	$ 8,090	$ 5,809
Effect of legally enforceable master netting agreements	26,108	25,957
Gross fair value of contracts outstanding at January 1, 2008	34,198	31,766
Contracts realized or otherwise settled	(12,773)	(12,802)
Fair value of new contracts	40,916	39,194
Changes in fair values attributable to changes in valuation techniques and assumptions	—	—
Other changes in fair value	(6,818)	(4,293)
Gross fair value of contracts outstanding at December 31, 2008	55,523	53,865
Effect of legally enforceable master netting agreements	(48,091)	(48,726)
Net fair value of contracts outstanding at December 31, 2008	$ 7,432	$ 5,139

The following table indicates the schedule of maturities of nonexchange-traded commodity derivative contracts at December 31, 2008.

December 31, 2008 (in millions)	Asset position	Liability position
Maturity less than 1 year	$ 27,282	$ 24,381
Maturity 1–3 years	22,463	20,047
Maturity 4–5 years	3,954	3,609
Maturity in excess of 5 years	1,824	5,828
Gross fair value of contracts outstanding at December 31, 2008	55,523	53,865
Effects of legally enforceable master netting agreements	(48,091)	(48,726)
Net fair value of contracts outstanding at December 31, 2008	$ 7,432	$ 5,139

FORWARD-LOOKING STATEMENTS

From time to time, the Firm has made and will make forward-looking statements. These statements can be identified by the fact that they do not relate strictly to historical or current facts. Forward-looking statements often use words such as "anticipate," "target," "expect," "estimate," "intend," "plan," "goal," "believe," or other words of similar meaning. Forward-looking statements provide JPMorgan Chase's current expectations or forecasts of future events, circumstances, results or aspirations. JPMorgan Chase's disclosures in this Annual Report contain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995. The Firm also may make forward-looking statements in its other documents filed or furnished with the SEC. In addition, the Firm's senior management may make forward-looking statements orally to analysts, investors, representatives of the media and others.

All forward-looking statements are, by their nature, subject to risks and uncertainties, many of which are beyond the Firm's control. JPMorgan Chase's actual future results may differ materially from those set forth in its forward-looking statements. While there is no assurance that any list of risks and uncertainties or risk factors is complete, below are certain factors which could cause actual results to differ from those in the forward-looking statements.

- local, regional and international business, economic and political conditions and geopolitical events;
- changes in trade, monetary and fiscal policies and laws;
- securities and capital markets behavior, including changes in market liquidity and volatility;
- changes in investor sentiment or consumer spending or saving behavior;
- ability of the Firm to manage effectively its liquidity;
- credit ratings assigned to the Firm or its subsidiaries;
- the Firm's reputation;
- ability of the Firm to deal effectively with an economic slowdown or other economic or market difficulty;
- technology changes instituted by the Firm, its counterparties or competitors;
- mergers and acquisitions, including the Firm's ability to integrate acquisitions;
- ability of the Firm to develop new products and services;
- acceptance of the Firm's new and existing products and services by the marketplace and the ability of the Firm to increase market share;
- ability of the Firm to attract and retain employees;
- ability of the Firm to control expense;
- competitive pressures;
- changes in the credit quality of the Firm's customers and counterparties;

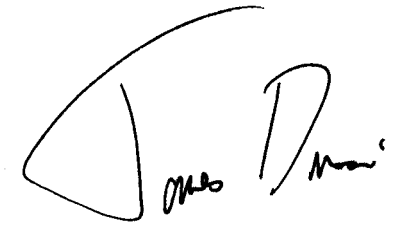
Any forward-looking statements made by or on behalf of the Firm speak only as of the date they are made, and JPMorgan Chase does not undertake to update forward-looking statements to reflect the impact of circumstances or events that arise after the date the forward-looking statement was made. The reader should, however, consult any further disclosures of a forward-looking nature the Firm may make in any subsequent Annual Reports on Form 10-K, Quarterly Reports on Form 10-Q, or Current Reports on Form 8-K.

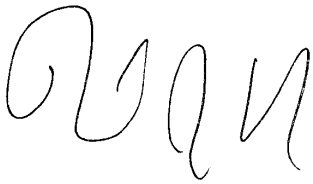
Management's report on internal control over financial reporting

Management of JPMorgan Chase & Co. ("JPMorgan Chase" or the "Firm") is responsible for establishing and maintaining adequate internal control over financial reporting. Internal control over financial reporting is a process designed by, or under the supervision of, the Firm's principal executive and principal financial officers, or persons performing similar functions, and effected by JPMorgan Chase's Board of Directors, management and other personnel, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with accounting principles generally accepted in the United States of America.



JPMorgan Chase's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records, that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the Firm's assets; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the Firm are being made only in accordance with authorizations of JPMorgan Chase's management and directors; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of the Firm's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.



Management has completed an assessment of the effectiveness of the Firm's internal control over financial reporting as of December 31, 2008. In making the assessment, management used the framework in "Internal Control – Integrated Framework" promulgated by the Committee of Sponsoring Organizations of the Treadway Commission, commonly referred to as the "COSO" criteria.

Based upon the assessment performed, management concluded that as of December 31, 2008, JPMorgan Chase's internal control over financial reporting was effective based upon the COSO criteria. Additionally, based upon management's assessment, the Firm determined that there were no material weaknesses in its internal control over financial reporting as of December 31, 2008.

The effectiveness of the Firm's internal control over financial reporting as of December 31, 2008, has been audited by PricewaterhouseCoopers LLP, an independent registered public accounting firm, as stated in their report which appears herein.

Report of independent registered public accounting firm

PricewaterhouseCoopers LLP • 300 Madison Avenue • New York, NY 10017

Report of Independent Registered Public Accounting Firm To the Board of Directors and Stockholders of JPMorgan Chase & Co.:

In our opinion, the accompanying consolidated balance sheets and the related consolidated statements of income, changes in stockholders' equity and comprehensive income and cash flows present fairly, in all material respects, the financial position of JPMorgan Chase & Co. and its subsidiaries (the "Firm") at December 31, 2008 and 2007, and the results of their operations and their cash flows for each of the three years in the period ended December 31, 2008 in conformity with accounting principles generally accepted in the United States of America. Also in our opinion, the Firm maintained, in all material respects, effective internal control over financial reporting as of December 31, 2008, based on criteria established in Internal Control – Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). The Firm's management is responsible for these financial statements, for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting, included in the accompanying "Management's report on internal control over financial reporting." Our responsibility is to express opinions on these financial statements and on the Firm's internal control over financial reporting based on our integrated audits. We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free of material misstatement and whether effective internal control over financial reporting was maintained in all material respects. Our audits of the financial statements included examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements, assessing the accounting principles used and significant estimates made by management, and evaluating the overall financial statement presentation. Our audit of internal control over financial reporting included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, and testing and evaluating the design and operating effectiveness of internal control based on the assessed risk. Our audits also included performing such other procedures as we considered necessary in the circumstances. We believe that our audits provide a reasonable basis for our opinions.

As discussed in Note 4, Note 5, and Note 28 to the Consolidated Financial Statements, effective January 1, 2007 the Firm adopted Statement of Financial Accounting Standards No. 157, "Fair Value Measurement," Statement of Financial Accounting Standards No. 159, "Fair Value Option for Financial Assets and Financial Liabilities," and FASB Interpretation No. 48, "Accounting for Uncertainty in Income Taxes."

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (i) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (ii) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (iii) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

Note: In 2008, the fair values of noncash assets acquired and liabilities assumed in the merger with Bear Stearns were $288.2 billion and $287.7 billion, respectively; approximately 26 million shares of common stock, valued at approximately $1.2 billion, were issued in connection with the Bear Stearns merger. Also, in 2008 the fair values of noncash assets acquired and liabilities assumed in the Washington Mutual transaction were $260.0 billion and $259.8 billion, respectively. In 2006, the Firm exchanged selected corporate trust businesses for The Bank of New York's consumer, business banking and middle-market banking businesses. The fair values of the noncash assets exchanged were $2.15 billion.

The Notes to Consolidated Financial Statements are an integral part of these statements.

Note 1 – Basis of presentation

JPMorgan Chase & Co. ("JPMorgan Chase" or the "Firm"), a financial holding company incorporated under Delaware law in 1968, is a leading global financial services firm and one of the largest banking institutions in the United States of America ("U.S."), with operations worldwide. The Firm is a leader in investment banking, financial services for consumers and businesses, financial transaction processing and asset management. For a discussion of the Firm's business segment information, see Note 37 on pages 226–227 of this Annual Report.

The accounting and financial reporting policies of JPMorgan Chase and its subsidiaries conform to accounting principles generally accepted in the United States of America ("U.S. GAAP"). Additionally, where applicable, the policies conform to the accounting and reporting guidelines prescribed by bank regulatory authorities.

Certain amounts in prior periods have been reclassified to conform to the current presentation.

Consolidation

The Consolidated Financial Statements include the accounts of JPMorgan Chase and other entities in which the Firm has a controlling financial interest. All material intercompany balances and transactions have been eliminated.

The usual condition for a controlling financial interest is the ownership of a majority of the voting interests of the entity. However, a controlling financial interest also may be deemed to exist with respect to entities, such as special purpose entities ("SPEs"), through arrangements that do not involve controlling voting interests.

SPEs are an important part of the financial markets, providing market liquidity by facilitating investors' access to specific portfolios of assets and risks. For example, they are critical to the functioning of the mortgage- and asset-backed securities and commercial paper markets. SPEs may be organized as trusts, partnerships or corporations and are typically established for a single, discrete purpose. SPEs are not typically operating entities and usually have a limited life and no employees. The basic SPE structure involves a company selling assets to the SPE. The SPE funds the purchase of those assets by issuing securities to investors. The legal documents that govern the transaction specify how the cash earned on the assets must be allocated to the SPE's investors and other parties that have rights to those cash flows. SPEs are generally structured to insulate investors from claims on the SPE's assets by creditors of other entities, including the creditors of the seller of the assets.

There are two different accounting frameworks applicable to SPEs: The qualifying SPE ("QSPE") framework under SFAS 140 and the variable interest entity ("VIE") framework under FIN 46R. The applicable framework depends on the nature of the entity and the Firm's relation to that entity. The QSPE framework is applicable when an entity transfers (sells) financial assets to an SPE meeting certain criteria defined in SFAS 140. These criteria are designed to ensure that the activities of the entity are essentially predetermined at the inception of the vehicle and that the transferor of the financial assets cannot exercise control over the entity and the assets therein. Entities meeting these criteria are not consolidated by the transferor or other counterparties as long as they do not have the unilateral ability to liquidate or to cause the entity to no longer meet the QSPE criteria. The Firm primarily follows the QSPE model for securitizations of its residential and commercial mortgages, and credit card, automobile and student loans. For further details, see Note 16 on pages 180–188 of this Annual Report.

When an SPE does not meet the QSPE criteria, consolidation is assessed pursuant to FIN 46R. Under FIN 46R, a VIE is defined as an entity that: (1) lacks enough equity investment at risk to permit the entity to finance its activities without additional subordinated financial support from other parties; (2) has equity owners that lack the right to make significant decisions affecting the entity's operations; and/or (3) has equity owners that do not have an obligation to absorb the entity's losses or the right to receive the entity's returns.

FIN 46R requires a variable interest holder (i.e., a counterparty to a VIE) to consolidate the VIE if that party will absorb a majority of the expected losses of the VIE, receive the majority of the expected residual returns of the VIE, or both. This party is considered the primary beneficiary. In making this determination, the Firm thoroughly evaluates the VIE's design, capital structure and relationships among the variable interest holders. When the primary beneficiary cannot be identified through a qualitative analysis, the Firm performs a quantitative analysis, which computes and allocates expected losses or residual returns to variable interest holders. The allocation of expected cash flows in this analysis is based upon the relative rights and preferences of each variable interest holder in the VIE's capital structure. The Firm reconsiders whether it is the primary beneficiary of a VIE when certain events occur as required by FIN 46R. For further details, see Note 17 on pages 189–198 of this Annual Report.

All retained interests and significant transactions between the Firm, QSPEs and nonconsolidated VIEs are reflected on JPMorgan Chase's Consolidated Balance Sheets and in the Notes to consolidated financial statements.

Investments in companies that are considered to be voting-interest entities under FIN 46R in which the Firm has significant influence over operating and financing decisions are either accounted for in accordance with the equity method of accounting or at fair value if elected under SFAS 159 ("Fair Value Option"). These investments are generally included in other assets, with income or loss included in other income.

For a discussion of the accounting for private equity investments, see Note 6 on pages 159–160 of this Annual Report.

Assets held for clients in an agency or fiduciary capacity by the Firm are not assets of JPMorgan Chase and are not included in the Consolidated Balance Sheets.

Use of estimates in the preparation of consolidated financial statements

The preparation of Consolidated Financial Statements requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities, revenue and expense, and disclosures

of contingent assets and liabilities. Actual results could be different from these estimates. For discussion of Critical Accounting Estimates used by the Firm, see pages 119–123 of this Annual Report.

Foreign currency translation
JPMorgan Chase revalues assets, liabilities, revenue and expense denominated in non-U.S. currencies into U.S. dollars using applicable exchange rates.

Gains and losses relating to translating functional currency financial statements for U.S. reporting are included in other comprehensive income (loss) within stockholders' equity. Gains and losses relating to nonfunctional currency transactions, including non-U.S. operations where the functional currency is the U.S. dollar, are reported in the Consolidated Statements of Income.

Foreclosed property
The Firm acquires property from borrowers through loan restructurings, workouts, and foreclosures. Property acquired may include real property (e.g., land, buildings, and fixtures) and personal property (e.g., aircraft, railcars, and ships). Acquired property is valued at fair value less costs to sell at acquisition. Each quarter the fair value of the acquired property is reviewed and adjusted, if necessary. Any adjustments to fair value in the first 90 days are credited/charged to the allowance for loan losses and thereafter to other expense.

Statements of cash flows
For JPMorgan Chase's Consolidated Statements of Cash Flows, cash is defined as those amounts included in cash and due from banks.

Significant accounting policies
The following table identifies JPMorgan Chase's other significant accounting policies and the Note and page where a detailed description of each policy can be found.

Note 2 – Business changes and developments

Decrease in Common Stock Dividend
On February 23, 2009, the Board of Directors reduced the Firm's quarterly common stock dividend from $0.38 to $0.05 per share, effective for the dividend payable April 30, 2009, to shareholders of record on April 6, 2009.

Acquisition of the banking operations of Washington Mutual Bank
On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank ("Washington Mutual") from the Federal Deposit Insurance Corporation ("FDIC") for $1.9 billion. The acquisition expands JPMorgan Chase's consumer branch network into several states, including California, Florida and Washington, among others. The acquisition also extends the reach of the Firm's business banking, commercial banking, credit card, consumer lending and wealth management businesses. The acquisition was accounted for under the purchase method of accounting in accordance with SFAS 141.

The $1.9 billion purchase price was allocated to the Washington Mutual assets acquired and liabilities assumed using preliminary allocated values as of September 25, 2008, which resulted in negative goodwill. The initial allocation of the purchase price was presented on a preliminary basis at September 30, 2008, due to the short time period between the closing of the transaction (which occurred simultaneously with its announcement on September 25, 2008) and the end of the third quarter. In accordance with SFAS 141, noncurrent nonfinancial assets that are not held-for-sale, such as the premises and equipment and other intangibles, acquired in the Washington Mutual transaction were written down against the negative goodwill. The negative goodwill that remained after writing down the nonfinancial assets was recognized as an extraordinary gain. As a result of the refinement of the purchase price allocation during the fourth quarter of 2008, the initial extraordinary gain of $581 million was increased $1.3 billion to $1.9 billion.

The computation of the purchase price and the allocation of the purchase price to the net assets acquired in the Washington Mutual transaction – based upon their respective values as of September 25, 2008, and the resulting negative goodwill – are presented below. The allocation of the purchase price may be modified through September 25, 2009, as more information is obtained about the fair value of assets acquired and liabilities assumed.

(in millions)		
Purchase price		
Purchase price		$ 1,938
Direct acquisition costs		3
Total purchase price		1,941
Net assets acquired		
Washington Mutual's net assets before fair value adjustments	$ 38,766	
Washington Mutual's goodwill and other intangible assets	(7,566)	
Subtotal	31,200	
Adjustments to reflect assets acquired at fair value:		
Securities	(20)	
Trading assets	(591)	
Loans	(31,018)	
Allowance for loan losses	8,216	
Premises and equipment	680	
Accrued interest and accounts receivable	(295)	
Other assets	4,125	
Adjustments to reflect liabilities assumed at fair value:		
Deposits	(683)	
Other borrowed funds	68	
Accounts payable and other liabilities	(900)	
Long-term debt	1,127	
Fair value of net assets acquired		11,909
Negative goodwill before allocation to nonfinancial assets		(9,968)
Negative goodwill allocated to nonfinancial assets[(a)]		8,062
Negative goodwill resulting from the acquisition[(b)]		$ (1,906)

(a) The acquisition was accounted for as a purchase business combination in accordance with SFAS 141. SFAS 141 requires the assets (including identifiable intangible assets) and liabilities (including executory contracts and other commitments) of an acquired business as of the effective date of the acquisition to be recorded at their respective fair values and consolidated with those of JPMorgan Chase. The fair value of the net assets of Washington Mutual's banking operations exceeded the $1.9 billion purchase price, resulting in negative goodwill. In accordance with SFAS 141, noncurrent, nonfinancial assets not held-for-sale, such as premises and equipment and other intangibles, were written down against the negative goodwill. The negative goodwill that remained after writing down transaction related core deposit intangibles of approximately $4.9 billion and premises and equipment of approximately $3.2 billion was recognized as an extraordinary gain of $1.9 billion.

(b) The extraordinary gain was recorded in Corporate/Private Equity.

The following condensed statement of net assets acquired reflects the value assigned to the Washington Mutual net assets as of September 25, 2008.

(in millions)	September 25, 2008
Assets	
Cash and due from banks	**$ 3,680**

Total liabilities	**259,802**
Washington Mutual net assets acquired	**$ 3,847**

Merger with The Bear Stearns Companies Inc.

Effective May 30, 2008, BSC Merger Corporation, a wholly owned subsidiary of JPMorgan Chase, merged with The Bear Stearns Companies Inc. ("Bear Stearns") pursuant to the Agreement and Plan of Merger, dated as of March 16, 2008, as amended March 24, 2008, and Bear Stearns became a wholly owned subsidiary of JPMorgan Chase. The merger provided the Firm with a leading global prime brokerage platform; strengthened the Firm's equities and asset management businesses; enhanced capabilities in mortgage origination, securitization and servicing; and expanded the platform of the Firm's energy business. The merger is being accounted for under the purchase method of accounting, which requires that the assets and liabilities of Bear Stearns be fair valued. The total purchase price to complete the merger was $1.5 billion.

The merger with Bear Stearns was accomplished through a series of transactions that were reflected as step acquisitions in accordance with SFAS 141. On April 8, 2008, pursuant to the share exchange agreement, JPMorgan Chase acquired 95 million newly issued shares of Bear Stearns common stock (or 39.5% of Bear Stearns common stock after giving effect to the issuance) for 21 million shares of JPMorgan Chase common stock. Further, between March 24, 2008, and May 12, 2008, JPMorgan Chase acquired approximately 24 million shares of Bear Stearns common stock in the open market at an average purchase price of $12.37 per share. The share exchange and cash purchase transactions resulted in JPMorgan Chase owning approximately 49.4% of Bear Stearns common stock immediately prior to consummation of the merger. Finally, on May 30, 2008, JPMorgan Chase completed the merger. As a result of the merger, each outstanding share of Bear Stearns common stock (other than shares then held by JPMorgan Chase) was converted into the right to receive 0.21753 shares of common stock of JPMorgan Chase. Also, on May 30, 2008, the shares of common stock that JPMorgan Chase and Bear Stearns acquired from each other in the share exchange transaction were cancelled. From April 8, 2008, through May 30, 2008, JPMorgan Chase accounted for the investment in Bear Stearns under the equity method of accounting in accordance with APB 18. During this period, JPMorgan Chase recorded reductions to its investment in Bear Stearns representing its share of Bear Stearns net losses, which was recorded in other income and accumulated other comprehensive income.

In conjunction with the Bear Stearns merger, in June 2008, the Federal Reserve Bank of New York (the "FRBNY") took control, through a limited liability company ("LLC") formed for this purpose, of a portfolio of $30 billion in assets acquired from Bear Stearns, based on the value of the portfolio as of March 14, 2008. The assets of the LLC were funded by a $28.85 billion term loan from the FRBNY, and a $1.15 billion subordinated loan from JPMorgan Chase. The JPMorgan Chase note is subordinated to the FRBNY loan and will bear the first $1.15 billion of any losses of the portfolio. Any remaining assets in the portfolio after repayment of the FRBNY loan, the JPMorgan Chase note and the expense of the LLC will be for the account of the FRBNY.

As a result of step acquisition accounting, the total $1.5 billion purchase price was allocated to the Bear Stearns assets acquired and liabilities assumed using their fair values as of April 8, 2008, and May 30, 2008, respectively. The summary computation of the purchase price and the allocation of the purchase price to the net assets of Bear Stearns are presented below. The allocation of the purchase price may be modified through May 30, 2009, as more information is obtained about the fair value of assets acquired and liabilities assumed.

(in millions, except for shares (in thousands), per share amounts and where otherwise noted)

Purchase price		
Shares exchanged in the Share Exchange transaction (April 8, 2008)	95,000	
Other Bear Stearns shares outstanding	145,759	
Total Bear Stearns stock outstanding	240,759	
Cancellation of shares issued in the Share Exchange transaction	(95,000)	
Cancellation of shares acquired by JPMorgan Chase for cash in the open market	(24,061)	
Bear Stearns common stock exchanged as of May 30, 2008	121,698	
Exchange ratio	0.21753	
JPMorgan Chase common stock issued	26,473	
Average purchase price per JPMorgan Chase common share[a]	$ 45.26	
Total fair value of JPMorgan Chase common stock issued		$ 1,198
Bear Stearns common stock acquired for cash in the open market (24 million shares at an average share price of $12.37 per share)		298
Fair value of employee stock awards (largely to be settled by shares held in the RSU Trust[b])		242
Direct acquisition costs		27
Less: Fair value of Bear Stearns common stock held in the RSU Trust and included in the exchange of common stock		(269)[b]
Total purchase price		1,496
Net assets acquired		
Bear Stearns common stockholders' equity	$ 6,052	
Adjustments to reflect assets acquired at fair value:		
Trading assets	(3,831)	
Premises and equipment	497	
Other assets	(235)	
Adjustments to reflect liabilities assumed at fair value:		
Long-term debt	504	
Other liabilities	(2,252)	
Fair value of net assets acquired excluding goodwill		735
Goodwill resulting from the merger[c]		$ 761

(a) The value of JPMorgan Chase common stock was determined by averaging the closing prices of JPMorgan Chase's common stock for the four trading days during the period March 19, 2008, through March 25, 2008.

(b) Represents shares of Bear Stearns common stock held in an irrevocable grantor trust (the "RSU Trust") to be used to settle stock awards granted to selected employees and certain key executives under certain heritage Bear Stearns employee stock plans. Shares in the RSU Trust were exchanged for 6 million shares of JPMorgan Chase common stock at the merger exchange ratio of 0.21753. For further discussion of the RSU trust, see Note 10 on pages 167–169 of this Annual Report.

(c) The goodwill was recorded in the Investment Bank.

Condensed statement of net assets acquired

The following reflects the value assigned to Bear Stearns net assets as of the merger date.

(in millions)	May 30, 2008
Assets	
Cash and due from banks	**$ 534**
Federal funds sold and securities purchased under resale agreements	**21,204**
Securities borrowed	**55,195**
Trading assets	**136,535**
Loans	**4,407**
Accrued interest and accounts receivable	**34,677**
Goodwill	**761**
All other assets	**35,418**
Total assets	**$ 288,731**
Liabilities	
Federal funds purchased and securities loaned or sold under repurchase agreements	**$ 54,643**
Other borrowings	**16,166**
Trading liabilities	**24,267**
Beneficial interests issued by consolidated VIEs	**47,042**
Long-term debt	**67,015**
Accounts payable and other liabilities	**78,532**
Total liabilities	**287,665**
Bear Stearns net assets[a]	**$ 1,066**

(a) Reflects the fair value assigned to 49.4% of the Bear Stearns net assets acquired on April 8, 2008 (net of related amortization), and the fair value assigned to the remaining 50.6% of the Bear Stearns net assets acquired on May 30, 2008. The difference between the Bear Stearns net assets acquired as presented above and the fair value of the net assets acquired (including goodwill) presented in the previous table represents JPMorgan Chase's net losses recorded under the equity method of accounting.

Unaudited pro forma condensed combined financial information reflecting Bear Stearns merger and Washington Mutual transaction

The following unaudited pro forma condensed combined financial information presents the results of operations of the Firm as they may have appeared if the Bear Stearns merger and the Washington Mutual transaction had been completed on January 1, 2008, and January 1, 2007.

Year ended December 31, (in millions, except per share data)	**2008**	2007
Total net revenue	**$ 68,071**	$ 92,052
Income (loss) before extraordinary gain	**(14,141)**	17,733
Net income (loss)	**(12,235)**	17,733
Net income per common share data:		
Basic earnings per share		
Income (loss) before extraordinary gain	**$ (4.22)**	$ 5.16
Net income (loss)	**(3.68)**	5.16
Diluted earnings per share[a]		
Income (loss) before extraordinary gain	**(4.22)**	5.01
Net income (loss)	**(3.68)**	5.01
Average common shares issued and outstanding		
Basic	**3,511**	3,430
Diluted[a]	**3,511**	3,534

(a) Common equivalent shares have been excluded from the pro forma computation of diluted loss per share for the year ended December 31, 2008, as the effect would be antidilutive.

The unaudited pro forma combined financial information is presented for illustrative purposes only and does not indicate the financial results of the combined company had the companies actually been combined as of January 1, 2008, or as of January 1, 2007, nor is it indicative of the results of operations in future periods. Included in the unaudited pro forma combined financial information for the years ended December 31, 2008 and 2007, were pro forma adjustments to reflect the results of operations of Bear Stearns, and Washington Mutual's banking operations, considering the purchase accounting, valuation and accounting conformity adjustments related to each transaction. For the Washington Mutual transaction, the amortization of purchase accounting adjustments to report interest-earning assets acquired and interest-bearing liabilities assumed at current interest rates is reflected in all periods presented. Valuation adjustments and the adjustment to conform allowance methodologies in the Washington Mutual transaction, and valuation and accounting conformity adjustments related to the Bear Stearns merger are reflected in the results for the years ended December 31, 2008 and 2007.

Internal reorganization related to the Bear Stearns merger

On June 30, 2008, JPMorgan Chase fully and unconditionally guaranteed each series of outstanding preferred stock of Bear Stearns, as well as all of Bear Stearns' outstanding Securities and Exchange Commission ("SEC") registered U.S. debt securities and obligations relating to trust preferred capital debt securities. Subsequently, on July 15, 2008, JPMorgan Chase completed an internal merger transaction, which resulted in each series of outstanding preferred stock of Bear Stearns being automatically exchanged into newly issued shares of JPMorgan Chase preferred stock having substantially identical terms. Depositary shares, which formerly had represented a one-fourth interest in a share of Bear Stearns preferred stock, continue to trade on the New York Stock Exchange but following completion of this internal merger transaction, represent a one-fourth interest in a share of JPMorgan Chase preferred stock. In addition, on July 31, 2008, JPMorgan Chase assumed (1) all of Bear Stearns' then-outstanding SEC-registered U.S. debt securities; (2) Bear Stearns' obligations relating to trust preferred capital debt securities; (3) certain of Bear Stearns' then-outstanding foreign debt securities; and (4) certain of Bear Stearns' guarantees of then-outstanding foreign debt securities issued by subsidiaries of Bear Stearns, in each case, in accordance with the agreements and indentures governing these securities. JPMorgan Chase also guaranteed Bear Stearns' obligations under Bear Stearns' U.S. $30.0 billion Euro Medium Term Note Programme and U.S. $4.0 billion Euro Note Issuance Programme.

Other business events

Termination of Chase Paymentech Solutions joint venture

The dissolution of Chase Paymentech Solutions joint venture, a global payments and merchant acquiring joint venture between JPMorgan Chase and First Data Corporation, was completed on November 1, 2008. JPMorgan Chase retained approximately 51% of the business and will operate the business under the name Chase Paymentech Solutions. The dissolution of Chase Paymentech

Solutions joint venture was accounted for as a step acquisition in accordance with SFAS 141, and the Firm recognized an after-tax gain of $627 million in the fourth quarter of 2008 as a result of the dissolution. The gain represents the amount by which the fair value of the net assets acquired (predominantly intangible assets and goodwill) exceeded JPMorgan Chase's book basis in the net assets transferred to First Data Corporation. Upon dissolution, the Firm began to consolidate the retained Chase Paymentech Solutions business.

Proceeds from Visa Inc. shares
On March 19, 2008, Visa Inc. ("Visa") completed its initial public offering ("IPO"). Prior to the IPO, JPMorgan Chase held approximately a 13% equity interest in Visa. On March 28, 2008, Visa used a portion of the proceeds from the offering to redeem a portion of the Firm's equity interest, which resulted in the recognition of a pretax gain of $1.5 billion (recorded in other income). In conjunction with the IPO, Visa placed $3.0 billion in escrow to cover liabilities related to certain litigation matters. The escrow was increased by $1.1 billion in the fourth quarter of 2008. JPMorgan Chase's interest in the escrow was recorded as a reduction of other expense and reported net to the extent of established litigation reserves.

Purchase of additional interest in Highbridge Capital Management
In January 2008, JPMorgan Chase purchased an additional equity interest in Highbridge Capital Management, LLC ("Highbridge"). As a result, the Firm currently owns 77.5% of Highbridge.

Acquisition of the consumer, business banking and middle-market banking businesses of The Bank of New York in exchange for selected corporate trust businesses, including trustee, paying agent, loan agency and document management services
On October 1, 2006, JPMorgan Chase completed the acquisition of The Bank of New York Company, Inc.'s ("The Bank of New York") consumer, business and middle-market banking businesses in exchange for selected corporate trust businesses plus a cash payment of $150 million. The transaction also included a contingent payment payable to The Bank of New York; the amount due of $25 million was paid in 2008. The acquisition added 339 branches and more than 400 ATMs, and it significantly strengthened Retail Financial Services' distribution network in the New York tri-state area. The Bank of New York businesses acquired were valued at a premium of $2.3 billion; the Firm's corporate trust businesses that were transferred (i.e., trustee, paying agent, loan agency and document management services) were valued at a premium of $2.2 billion. This transaction included the acquisition of approximately $7.7 billion in loans net of allowance for loan losses and $12.9 billion in deposits from the Bank of New York. The Firm also recognized core deposit intangibles of $485 million, which are being amortized using an accelerated method over a 10-year period. JPMorgan Chase recorded an after-tax gain of $622 million on this transaction in the fourth quarter of 2006. For additional discussion related to the transaction, see Note 3 on pages 140–141 of this Annual Report.

JPMorgan Partners management
On August 1, 2006, the buyout and growth equity professionals of JPMorgan Partners ("JPMP") formed an independent firm, CCMP Capital, LLC ("CCMP"), and the venture professionals separately formed an independent firm, Panorama Capital, LLC ("Panorama"). The investment professionals of CCMP and Panorama continue to manage the former JPMP investments pursuant to a management agreement with the Firm.

Sale of insurance underwriting business
On July 1, 2006, JPMorgan Chase completed the sale of its life insurance and annuity underwriting businesses to Protective Life Corporation for cash proceeds of approximately $1.2 billion, consisting of $900 million of cash received from Protective Life Corporation and approximately $300 million of preclosing dividends received from the entities sold. The after-tax impact of this transaction was negligible. The sale included both the heritage Chase insurance business and the insurance business that Bank One had bought from Zurich Insurance in 2003.

Acquisition of private-label credit card portfolio from Kohl's Corporation
On April 21, 2006, JPMorgan Chase completed the acquisition of $1.6 billion of private-label credit card receivables and approximately 21 million accounts from Kohl's Corporation ("Kohl's"). JPMorgan Chase and Kohl's also entered into an agreement under which JPMorgan Chase is offering private-label credit cards to both new and existing Kohl's customers.

Collegiate Funding Services
On March 1, 2006, JPMorgan Chase acquired, for approximately $663 million, Collegiate Funding Services, a leader in student loan servicing and consolidation. This acquisition included $6 billion of student loans.

Note 3 – Discontinued operations

On October 1, 2006, JPMorgan Chase completed the acquisition of The Bank of New York's consumer, small-business and middle-market banking businesses in exchange for selected corporate trust businesses. Refer to Note 2 on pages 135–140 of this Annual Report for additional information.

In anticipation of the close of the transaction on October 1, 2006, effective with the second quarter of 2006, the results of operations of these corporate trust businesses were transferred from the Treasury & Securities Services ("TSS") segment to the Corporate/Private Equity segment, and reported as discontinued operations. Condensed financial information of the selected corporate trust businesses follows.

Selected income statements data[(a)]

Year ended December 31, (in millions)	2006
Other noninterest revenue	$ 407
Net interest income	264
Gain on sale of discontinued operations	1,081
Total net revenue	1,752
Noninterest expense	385
Income from discontinued operations before income taxes	1,367
Income tax expense	572
Income from discontinued operations	$ 795

(a) There was no income from discontinued operations during 2008 or 2007.

The following is a summary of the assets and liabilities associated with the selected corporate trust businesses related to the Bank of New York transaction that closed on October 1, 2006.

Selected balance sheet data

(in millions)	October 1, 2006
Goodwill and other intangibles	$ 838
Other assets	547
Total assets	$ 1,385
Deposits	$ 24,011
Other liabilities	547
Total liabilities	$ 24,558

JPMorgan Chase provides certain transitional services to The Bank of New York for a defined period of time after the closing date. The Bank of New York compensates JPMorgan Chase for these transitional services.

Note 4 – Fair value measurement

In September 2006, the FASB issued SFAS 157 ("Fair Value Measurements"), which was effective for fiscal years beginning after November 15, 2007, with early adoption permitted. The Firm chose early adoption for SFAS 157 effective January 1, 2007. SFAS 157:

- Defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date, and establishes a framework for measuring fair value;
- Establishes a three-level hierarchy for fair value measurements based upon the transparency of inputs to the valuation of an asset or liability as of the measurement date;
- Nullifies the guidance in EITF 02-3, which required the deferral of profit at inception of a transaction involving a derivative financial instrument in the absence of observable data supporting the valuation technique;
- Eliminates large position discounts for financial instruments quoted in active markets and requires consideration of the Firm's creditworthiness when valuing liabilities; and
- Expands disclosures about instruments measured at fair value.

The Firm also chose early adoption for SFAS 159 effective January 1, 2007. SFAS 159 provides an option to elect fair value as an alternative measurement for selected financial assets, financial liabilities, unrecognized firm commitments and written loan commitments not previously recorded at fair value. The Firm elected fair value accounting for certain assets and liabilities not previously carried at fair value. For more information, see Note 5 on pages 156–158 of this Annual Report.

The following is a description of the Firm's valuation methodologies for assets and liabilities measured at fair value.

The Firm has an established and well-documented process for determining fair values. Fair value is based upon quoted market prices, where available. If listed prices or quotes are not available, fair value is based upon internally developed models that primarily use, as inputs, market-based or independently sourced market parameters, including but not limited to yield curves, interest rates, volatilities, equity or debt prices, foreign exchange rates and credit curves. In addition to market information, models also incorporate transaction details, such as maturity of the instrument. Valuation adjustments may be made to ensure that financial instruments are recorded at fair value. These adjustments include amounts to reflect counterparty credit quality, the Firm's creditworthiness, constraints on liquidity and unobservable parameters. Valuation adjustments are applied consistently over time.

- Credit valuation adjustments ("CVA") are necessary when the market price (or parameter) is not indicative of the credit quality of the counterparty. As few classes of derivative contracts are listed on an exchange, the majority of derivative positions are valued using internally developed models that use as their basis observable market parameters. Market practice is to quote parameters equivalent to an "AA" credit rating whereby all counterparties are assumed to have the same credit quality. Therefore, an adjustment is necessary to reflect the credit quality of each derivative counterparty to arrive at fair value. The adjustment also takes into account contractual factors designed to reduce the Firm's credit exposure to each counterparty, such as collateral and legal rights of offset.
- Debit valuation adjustments ("DVA") are necessary to reflect the credit quality of the Firm in the valuation of liabilities measured at fair value. This adjustment was incorporated into the Firm's valuations commencing January 1, 2007, in accordance with SFAS 157. The methodology to determine the adjustment is consistent with CVA and incorporates JPMorgan Chase's credit spread as observed through the credit default swap market.
- Liquidity valuation adjustments are necessary when the Firm may not be able to observe a recent market price for a financial instrument that trades in inactive (or less active) markets or to

reflect the cost of exiting larger-than-normal market-size risk positions (liquidity adjustments are not taken for positions classified within level 1 of the fair value hierarchy). The Firm tries to ascertain the amount of uncertainty in the initial valuation based upon the degree of liquidity of the market in which the financial instrument trades and makes liquidity adjustments to the carrying value of the financial instrument. The Firm measures the liquidity adjustment based upon the following factors: (1) the amount of time since the last relevant pricing point; (2) whether there was an actual trade or relevant external quote; and (3) the volatility of the principal risk component of the financial instrument. Costs to exit larger-than-normal market-size risk positions are determined based upon the size of the adverse market move that is likely to occur during the period required to bring a position down to a nonconcentrated level.

- Unobservable parameter valuation adjustments are necessary when positions are valued using internally developed models that use as their basis unobservable parameters – that is, parameters that must be estimated and are, therefore, subject to management judgment. These positions are normally traded less actively. Examples include certain credit products where parameters such as correlation and recovery rates are unobservable. Unobservable parameter valuation adjustments are applied to mitigate the possibility of error and revision in the estimate of the market price provided by the model.

The Firm has numerous controls in place intended to ensure that its fair valuations are appropriate. An independent model review group reviews the Firm's valuation models and approves them for use for specific products. All valuation models within the Firm are subject to this review process. A price verification group, independent from the risk-taking function, ensures observable market prices and market-based parameters are used for valuation wherever possible. For those products with material parameter risk for which observable market levels do not exist, an independent review of the assumptions made on pricing is performed. Additional review includes deconstruction of the model valuations for certain structured instruments into their components, and benchmarking valuations, where possible, to similar products; validating valuation estimates through actual cash settlement; and detailed review and explanation of recorded gains and losses, which are analyzed daily and over time. Valuation adjustments, which are also determined by the independent price verification group, are based upon established policies and are applied consistently over time. Any changes to the valuation methodology are reviewed by management to confirm the changes are justified. As markets and products develop and the pricing for certain products becomes more or less transparent, the Firm continues to refine its valuation methodologies. During 2008, no material changes were made to the Firm's valuation models.

The methods described above to estimate fair value may produce a fair value calculation that may not be indicative of net realizable value or reflective of future fair values. Furthermore, while the Firm believes its valuation methods are appropriate and consistent with other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different estimate of fair value at the reporting date.

Valuation Hierarchy

SFAS 157 establishes a three-level valuation hierarchy for disclosure of fair value measurements. The valuation hierarchy is based upon the transparency of inputs to the valuation of an asset or liability as of the measurement date. The three levels are defined as follows.

- Level 1 – inputs to the valuation methodology are quoted prices (unadjusted) for identical assets or liabilities in active markets.
- Level 2 – inputs to the valuation methodology include quoted prices for similar assets and liabilities in active markets, and inputs that are observable for the asset or liability, either directly or indirectly, for substantially the full term of the financial instrument.
- Level 3 – inputs to the valuation methodology are unobservable and significant to the fair value measurement. For a level 3 analysis, see pages 150–151 of this Note.

A financial instrument's categorization within the valuation hierarchy is based upon the lowest level of input that is significant to the fair value measurement.

Following is a description of the valuation methodologies used for instruments measured at fair value, including the general classification of such instruments pursuant to the valuation hierarchy.

Assets

Securities purchased under resale agreements ("resale agreements")

To estimate the fair value of resale agreements, cash flows are evaluated taking into consideration any derivative features of the resale agreement and are then discounted using the appropriate market rates for the applicable maturity. As the inputs into the valuation are primarily based upon readily observable pricing information, such resale agreements are generally classified within level 2 of the valuation hierarchy.

Loans and unfunded lending-related commitments

The majority of the Firm's loans and lending-related commitments are not carried at fair value on a recurring basis on the Consolidated Balance Sheets, nor are they actively traded. The fair value of such loans and lending-related commitments is included in the disclosures required by SFAS 107 on pages 154–155 of this Note. Loans carried at fair value on a recurring and nonrecurring basis are included in the applicable tables that follow.

Wholesale

The fair value of loans and lending-related commitments is calculated using observable market information, including pricing from actual market transactions or broker quotations where available. Where pricing information is not available for the specific loan, the valuation is generally based upon quoted market prices of similar instruments, such as loans and bonds. These comparable instruments share characteristics that typically include industry, rating, capital structure, seniority, and consideration of counterparty credit risk. In addition, general market conditions, including prevailing market spreads for credit and liquidity risk, are also considered in the valuation process.

For certain loans that are expected to be securitized, such as commercial and residential mortgages, fair value is estimated based upon observable pricing of asset-backed securities ("ABS") with similar collateral and incorporates adjustments (i.e., reductions) to these prices to account for securitization uncertainties including portfolio composition, market conditions and liquidity to arrive at the whole loan price. When data from recent market transactions is available it is incorporated as appropriate. If particular loans are not expected to be securitized they are marked for individual sale taking into consideration potential liquidation proceeds and property repossession/liquidation information, as appropriate. For further discussion of the valuation of mortgage loans carried at fair value, see the "Mortgage-related exposures carried at fair value" section of this Note on pages 151–153.

The Firm's loans carried at fair value and reported in trading assets are largely classified within level 3 due to the lack of observable pricing. Loans carried at fair value and reported in loans including leveraged lending funded loans, high-yield bridge financing and purchased nonperforming loans held in the Investment Bank ("IB") are classified within level 2 or 3 of the valuation hierarchy depending on the level of liquidity and activity in the markets for a particular product.

Consumer

Fair values for consumer installment loans (including automobile financings and consumer real estate not expected to be securitized), for which market rates for comparable loans are readily available, are based upon discounted cash flows adjusted for prepayment assumptions. The discount rates used for consumer installment loans are based on current market rates for new originations of comparable loans. Fair value for credit card receivables is based upon discounted expected cash flows. The discount rates used for credit card receivables incorporate only the effects of interest rate changes, since the expected cash flows already reflect an adjustment for credit risk. Consumer installment loans and credit card receivables that are not carried on the balance sheet at fair value are not classified within the fair value hierarchy. For further discussion of the valuation of mortgage loans carried at fair value, see the "Mortgage-related exposures carried at fair value" section of this Note.

Securities

Where quoted prices for identical securities are available in an active market, securities are classified in level 1 of the valuation hierarchy. Level 1 securities include highly liquid government bonds, mortgage products for which there are quoted prices in active markets (such as U.S. government agency or U.S. government-sponsored enterprise pass-through mortgage-backed securities) and exchange-traded equities.

If quoted market prices are not available for the specific security, the Firm may estimate the value of such instruments using a combination of observed transaction prices, independent pricing services and relevant broker quotes. Consideration is given to the nature of the quotes (e.g., indicative or firm) and the relationship of recently evidenced market activity to the prices provided from independent pricing services. The Firm may also use pricing models or discounted cash flows. In cases where there is limited activity or less transparency around inputs to the valuation, securities are classified within level 3 of the valuation hierarchy.

For certain collateralized mortgage and debt obligations, asset-backed securities and high-yield debt securities the determination of fair value may require benchmarking to similar instruments or analyzing default and recovery rates. For "cash" collateralized debt obligations ("CDOs"), external price information is not available. Therefore, cash CDOs are valued using market-standard models, such as Intex, to model the specific collateral composition and cash flow structure of each deal; key inputs to the model are market spread data for each credit rating, collateral type and other relevant contractual features. Asset-backed securities are valued based on external prices or market spread data, using current market assumptions on prepayments and defaults. For those asset-backed securities where the external price data is not observable or the limited available data is opaque, the collateral performance is monitored and the value of the security is assessed. To benchmark its valuations, the Firm looks to transactions for similar instruments and utilizes independent pricing provided by third-party vendors, broker quotes and relevant market indices such as the ABX index, as applicable. While none of those sources are solely indicative of fair value, they serve as directional indicators for the appropriateness of the Firm's estimates. The majority of collateralized mortgage and debt obligations, high-yield debt securities and asset-backed securities are currently classified in level 3 of the valuation hierarchy. For further discussion of the valuation of mortgage securities carried at fair value see the "Mortgage-related exposures carried at fair value" section of this Note on pages 151–153.

Commodities

Commodities inventory is carried at the lower of cost or fair value. The fair value for commodities inventory is determined primarily using pricing and data derived from the markets on which the underlying commodities are traded. Market prices may be adjusted for liquidity. The Firm also has positions in commodity-based derivatives that can be traded on an exchange or over-the-counter. The pricing inputs to these derivatives include forward curves of underlying commodities, basis curves, volatilities, correlations, and occasionally other model parameters. The valuation of these derivatives is based upon calibrating to market transactions, as well as to independent pricing information from sources such as brokers and dealer consensus pricing services. Where inputs are unobservable, they are benchmarked to observable market data based upon historic and implied correlations, then adjusted for uncertainty where appropriate. The majority of commodities inventory and commodities-based derivatives are classified within level 2 of the valuation hierarchy.

Derivatives

Exchange-traded derivatives valued using quoted prices are classified within level 1 of the valuation hierarchy. However, few classes of derivative contracts are listed on an exchange; thus, the majority of the Firm's derivative positions are valued using internally developed models that use as their basis readily observable market parameters – that is, parameters that are actively quoted and can be validated to external sources, including industry pricing services. Depending on the types and contractual terms of derivatives, fair value can be modeled using a series of techniques, such as the Black-Scholes option pricing model, simulation models or a combination of various mod-

els, which are consistently applied. Where derivative products have been established for some time, the Firm uses models that are widely accepted in the financial services industry. These models reflect the contractual terms of the derivatives, including the period to maturity, and market-based parameters such as interest rates, volatility, and the credit quality of the counterparty. Further, many of these models do not contain a high level of subjectivity, as the methodologies used in the models do not require significant judgment, and inputs to the model are readily observable from actively quoted markets, as is the case for "plain vanilla" interest rate swaps and option contracts and credit default swaps ("CDS"). Such instruments are generally classified within level 2 of the valuation hierarchy.

Derivatives that are valued based upon models with significant unobservable market parameters and that are normally traded less actively, have trade activity that is one way, and/or are traded in less-developed markets are classified within level 3 of the valuation hierarchy. Level 3 derivatives, for example, include credit default swaps referenced to mortgage-backed securities, certain types of CDO transactions, options on baskets of single-name stocks, and callable exotic interest rate options. Such derivatives are primarily used for risk management purposes.

For certain derivative products, such as credit default swaps referenced to mortgage-backed securities, the value is based on the underlying mortgage risk. As these instruments are not actively quoted, the estimate of fair value considers the valuation of the underlying collateral (mortgage loans). Inputs to the valuation will include available information on similar underlying loans or securities in the cash market. The prepayments and loss assumptions on the underlying loans or securities are estimated using a combination of historical data, prices on market transactions, and other prepayment and default scenarios and analysis. Relevant observable market indices such as the ABX or CMBX, are considered, as well as any relevant transaction activity.

Other complex products, such as those sensitive to correlation between two or more underlyings, also fall within level 3 of the hierarchy. Such instruments include complex credit derivative products which are illiquid and non-standard in nature, including CDOs and CDO-squared. A CDO is a debt security collateralized by a variety of debt obligations, including bonds and loans of different maturities and credit qualities. The repackaging of such securities and loans within a CDO results in the creation of tranches, which are instruments with differing risk profiles. In a CDO-squared, the instrument is a CDO where the underlying debt instruments are also CDOs. For CDO-squared transactions, while inputs such as CDS spreads and recovery rates may be observable, the correlation between the underlying debt instruments is unobservable. The correlation levels are not only modeled on a portfolio basis but are also calibrated at a transaction level to liquid benchmark tranches. For all complex credit derivative products, actual transactions, where available, are used to regularly recalibrate all unobservable parameters.

Correlation sensitivity is also material to the overall valuation of options on baskets of single-name stocks; the valuation of these baskets is typically not observable due to their non-standardized structuring. Correlation for products such as these are typically estimated based on an observable basket of stocks and then adjusted to reflect the differences between the underlying equities.

For callable exotic interest rate options, while most of the assumptions in the valuation can be observed in active markets (e.g. interest rates and volatility), the callable option transaction flow is essentially one-way, and as such, price observability is limited. As pricing information is limited, assumptions are based upon the dynamics of the underlying markets (e.g. the interest rate markets) including the range and possible outcomes of the applicable inputs. In addition, the models used are calibrated, as relevant, to liquid benchmarks and valuation is tested against monthly independent pricing services and actual transactions.

Mortgage servicing rights and certain retained interests in securitizations

Mortgage servicing rights ("MSRs") and certain retained interests from securitization activities do not trade in an active, open market with readily observable prices. While sales of MSRs do occur, the precise terms and conditions typically are not readily available. Accordingly, the Firm estimates the fair value of MSRs and certain other retained interests in securitizations using discounted cash flow ("DCF") models.

- For MSRs, the Firm uses an option-adjusted spread ("OAS") valuation model in conjunction with the Firm's proprietary prepayment model to project MSR cash flows over multiple interest rate scenarios, which are then discounted at risk-adjusted rates to estimate an expected fair value of the MSRs. The OAS model considers portfolio characteristics, contractually specified servicing fees, prepayment assumptions, delinquency rates, late charges, other ancillary revenue, costs to service and other economic factors. The Firm reassesses and periodically adjusts the underlying inputs and assumptions used in the OAS model to reflect market conditions and assumptions that a market participant would consider in valuing the MSR asset. Due to the nature of the valuation inputs, MSRs are classified within level 3 of the valuation hierarchy.
- For certain retained interests in securitizations (such as interest-only strips), a single interest rate path discounted cash flow model is used and generally includes assumptions based upon projected finance charges related to the securitized assets, estimated net credit losses, prepayment assumptions and contractual interest paid to third-party investors. Changes in the assumptions used may have a significant impact on the Firm's valuation of retained interests, and such interests are therefore typically classified within level 3 of the valuation hierarchy.

For both MSRs and certain other retained interests in securitizations, the Firm compares its fair value estimates and assumptions to observable market data where available and to recent market activity and actual portfolio experience. For further discussion of the most significant assumptions used to value retained interests in securitizations and MSRs, as well as the applicable stress tests for those assumptions, see Note 16 and Note 18 on pages 180–188 and 198–201, respectively, of this Annual Report.

Private equity investments

The valuation of nonpublic private equity investments, held primarily by the Private Equity business within Corporate, requires significant management judgment due to the absence of quoted market prices, the inherent lack of liquidity and the long-term nature of such assets. As such, private equity investments are valued initially based upon cost. Each quarter, valuations are reviewed utilizing available and relevant market data to determine if the carrying value of these investments should be adjusted. Such market data primarily includes observations of the trading multiples of public companies considered comparable to the private companies being valued and the operating performance of the underlying portfolio company, including its historical and projected net income and earnings before interest, taxes, depreciation and amortization ("EBITDA"). Valuations are adjusted to account for company-specific issues, the lack of liquidity inherent in a nonpublic investment and the fact that comparable public companies are not identical to the companies being valued. In addition, a variety of additional factors are reviewed by management, including, but not limited to, financing and sales transactions with third parties, future expectations of the particular investment, changes in market outlook and the third-party financing environment. The Firm applies its valuation methodology consistently from period to period and believes that the methodology and associated valuation adjustments are appropriate. Nonpublic private equity investments are included in level 3 of the valuation hierarchy.

Private equity investments also include publicly held equity investments, generally obtained through the initial public offering of privately held equity investments. Publicly held investments in liquid markets are marked to market at the quoted public value less adjustments for regulatory or contractual sales restrictions. Discounts for restrictions are quantified by analyzing the length of the restriction period and the volatility of the equity security. Publicly held investments are largely classified in level 2 of the valuation hierarchy.

Other assets

The fair value of asset-backed commercial paper ("ABCP") investments purchased under the Federal Reserve's Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility ("AML Facility") for U.S. money market mutual funds is determined based on observable market information and is classified in level 2 of the valuation hierarchy.

Liabilities

Securities sold under repurchase agreements ("repurchase agreements")

To estimate the fair value of repurchase agreements, cash flows are evaluated taking into consideration any derivative features and are then discounted using the appropriate market rates for the applicable maturity. Generally, for these types of agreements, there is a requirement that collateral be maintained with a market value equal to, or in excess of, the principal amount loaned; as a result, there would be no adjustment, or an immaterial adjustment, to reflect the credit quality of the Firm (i.e., DVA) related to these agreements. As the inputs into the valuation are primarily based upon observable pricing information, repurchase agreements are classified within level 2 of the valuation hierarchy.

Beneficial interests issued by consolidated VIEs

The fair value of beneficial interests issued by consolidated VIEs ("beneficial interests") is estimated based upon the fair value of the underlying assets held by the VIEs. The valuation of beneficial interests does not include an adjustment to reflect the credit quality of the Firm, as the holders of these beneficial interests do not have recourse to the general credit of JPMorgan Chase. As the inputs into the valuation are generally based upon readily observable market pricing information, the majority of beneficial interests issued by consolidated VIEs are classified within level 2 of the valuation hierarchy.

Deposits, other borrowed funds and long-term debt

Included within deposits, other borrowed funds and long-term debt are structured notes issued by the Firm that are financial instruments containing embedded derivatives. To estimate the fair value of structured notes, cash flows are evaluated taking into consideration any derivative features and are then discounted using the appropriate market rates for the applicable maturities. In addition, the valuation of structured notes includes an adjustment to reflect the credit quality of the Firm (i.e., the DVA). Where the inputs into the valuation are primarily based upon readily observable market pricing information, the structured notes are classified within level 2 of the valuation hierarchy. Where significant inputs are unobservable, structured notes are classified within level 3 of the valuation hierarchy.

The following table presents the financial instruments carried at fair value as of December 31, 2008 and 2007, by caption on the Consolidated Balance Sheets and by SFAS 157 valuation hierarchy (as described above).

Assets and liabilities measured at fair value on a recurring basis

December 31, 2008 (in millions)	Quoted market prices in active markets (Level 1)	Internal models with significant observable market parameters (Level 2)	Internal models with significant unobservable market parameters (Level 3)	FIN 39 netting[d]	Total carrying value in the Consolidated Balance Sheets

(a) Physical commodities inventories are accounted for at the lower of cost or fair value.
(b) Includes assets for which the Firm serves as an intermediary between two parties and does not bear market risk. The assets are predominantly reflected within derivative receivables.
(c) Includes the fair value adjustment for unfunded lending-related commitments accounted for at fair value.
(d) As permitted under FIN 39, the Firm has elected to net derivative receivables and derivative payables and the related cash collateral received and paid when a legally enforceable master netting agreement exists. The increase in FIN 39 netting from December 31, 2007, primarily relates to the decline in interest rates, widening credit spreads and volatile foreign exchange rates reflected in interest rate, credit and foreign exchange derivatives, respectively.

Balances for which the Firm did not bear economic exposure at December 31, 2007, were not significant.

Changes in level 3 recurring fair value measurements

The tables below include a rollforward of the balance sheet amounts for the years ended December 31, 2008 and 2007 (including the change in fair value), for financial instruments classified by the Firm within level 3 of the valuation hierarchy. When a determination is made to classify a financial instrument within level 3, the determination is based upon the significance of the unobservable parameters to the overall fair value measurement. However, level 3 financial instruments typically include, in addition to the unobservable or level 3 components, observable components (that is, components that are actively quoted and can be validated to external sources); accordingly, the gains and losses in the table below include changes in fair value due in part to observable factors that are part of the valuation methodology. Also, the Firm risk manages the observable components of level 3 financial instruments using securities and derivative positions that are classified within level 1 or 2 of the valuation hierarchy; as these level 1 and level 2 risk management instruments are not included below, the gains or losses in the tables do not reflect the effect of the Firm's risk management activities related to such level 3 instruments.

	Fair value measurements using significant unobservable inputs					
For the year ended December 31, 2008 (in millions)	Fair value, January 1, 2008	Total realized/unrealized gains/(losses)[c]	Purchases, issuances settlements, net	Transfers into and/or out of level 3[c]	Fair value, December 31, 2008	Change in unrealized gains and (losses) related to financial instruments held at December 31, 2008

(a) Private equity instruments represent investments within the Corporate/Private Equity line of business.
(b) Level 3 liabilities as a percentage of total Firm liabilities accounted for at fair value (including liabilities carried at fair value on a nonrecurring basis) were 25% and 17% at December 31, 2008 and 2007, respectively. The Firm does not allocate the FIN 39 netting adjustment across the levels of the fair value hierarchy. As such, the level 3 derivative payables balance included in the level 3 total balance is gross of any netting adjustments.
(c) Beginning January 1, 2008, all transfers in and out of level 3 are assumed to occur at the beginning of the reporting period.
(d) Reported in principal transactions revenue.
(e) Changes in fair value for Retail Financial Services mortgage loans originated with the intent to sell and MSRs are measured at fair value and reported in mortgage fees and related income.
(f) Realized gains (losses) are reported in securities gains (losses). Unrealized gains (losses) are reported in accumulated other comprehensive income (loss).
(g) Reported in other income.

Assets and liabilities measured at fair value on a nonrecurring basis

Certain assets, liabilities and unfunded lending-related commitments are measured at fair value on a nonrecurring basis; that is, the instruments are not measured at fair value on an ongoing basis but are subject to fair value adjustments only in certain circumstances (for example, when there is evidence of impairment). The following tables present the financial instruments carried on the Consolidated Balance Sheets by caption and level within the SFAS 157 valuation hierarchy (as described above) as of December 31, 2008 and 2007, for which a nonrecurring change in fair value has been recorded during the reporting period.

December 31, 2008 (in millions)	Quoted market prices in active markets (Level 1)	Internal models with significant observable market parameters (Level 2)	Internal models with significant unobservable market parameters (Level 3)	Total carrying value in the Consolidated Balance Sheets
Loans[a]	**$ —**	**$ 4,991**	**$ 3,999**	**$ 8,990**
Other assets	**—**	**1,763**	**291**	**2,054**
Total assets at fair value on a nonrecurring basis	**$ —**	**$ 6,754**	**$ 4,290**	**$ 11,044**
Accounts payable and other liabilities[b]	**$ —**	**$ 212**	**$ 98**	**$ 310**
Total liabilities at fair value on a nonrecurring basis	**$ —**	**$ 212**	**$ 98**	**$ 310**

December 31, 2007 (in millions)	Quoted market prices in active markets (Level 1)	Internal models with significant observable market parameters (Level 2)	Internal models with significant unobservable market parameters (Level 3)	Total carrying value in the Consolidated Balance Sheets
Loans[a][c]	$ —	$ 2,818	$ 16,196	$ 19,014
Other assets	—	267	126	393
Total assets at fair value on a nonrecurring basis	$ —	$ 3,085	$ 16,322	$ 19,407
Accounts payable and other liabilities[b]	$ —	$ —	$ 103	$ 103
Total liabilities at fair value on a nonrecurring basis	$ —	$ —	$ 103	$ 103

(a) Includes leveraged lending and other loan warehouses held-for-sale.
(b) Represents the fair value adjustment associated with $1.5 billion and $3.2 billion of unfunded held-for-sale lending-related commitments within the leveraged lending portfolio at December 31, 2008 and 2007, respectively.
(c) Includes $4.5 billion of level 3 held-for-sale loans reclassified to held-for-investment during 2007.

Nonrecurring fair value changes

The following table presents the total change in value of financial instruments for which a fair value adjustment has been included in the Consolidated Statements of Income for the years ended December 31, 2008 and 2007, related to financial instruments held at December 31, 2008 and 2007.

Year ended December 31, (in millions)	**2008**	2007
Loans	**$ (3,887)**	$ (720)
Other assets	**(685)**	(161)
Accounts payable and other liabilities	**(285)**	2
Total nonrecurring fair value gains (losses)	**$ (4,857)**	$ (879)

In the above table, loans predominantly include the change in fair value for IB leveraged lending and warehouse loans carried on the balance sheet at the lower of cost or fair value; and accounts payable and other liabilities predominantly include the change in fair value for unfunded lending-related commitments within the leveraged lending portfolio.

Level 3 analysis

Level 3 assets (including assets measured at fair value on a nonrecurring basis) were 6% of total Firm assets at December 31, 2008. The following describes significant changes to level 3 assets during the year.

Level 3 assets increased $46.9 billion in 2008, largely due to the following:

- Acquisition of $41.5 billion of level 3 assets as a result of the merger with Bear Stearns.
- Acquisition of $5.9 billion of MSRs related to the Washington Mutual transaction.
- Purchase of approximately $4.4 billion of reverse mortgages in the first quarter of 2008, for which there is limited pricing information and a lack of market liquidity.
- Transfers of $14.0 billion of AAA-rated CLOs backed by corporate loans, based upon a significant reduction in new deal issuance and price transparency; $10.5 billion of mortgage-related assets, including commercial mortgage-backed securities with a rating below "AAA", other noninvestment grade mortgage securities and certain prime mortgages; and $2.8 billion of auction-rate securities, in each case due to a significant reduction in market liquidity.

The increases in level 3 assets described above were partially offset by:

- Approximately $20.0 billion of sales and markdowns of residential mortgage-backed securities, prime residential mortgage loans and Alt-A residential mortgage loans.
- $11.5 billion of sales and markdowns of leveraged loans, as well as transfers of similar loans to level 2 due to the increased price transparency for such assets.

- $3.5 billion of transfers of bridge loans to level 2 due to increased price transparency for such assets.

Gains and Losses

Gains and losses in the tables above for 2008 include:

- Losses on trading debt and equity instruments of approximately $12.8 billion, principally from mortgage-related transactions and auction-rate securities.
- A $6.9 billion decline in the fair value of the MSR asset.
- Losses of approximately $3.9 billion on leveraged loans. Leveraged loans are typically classified as held-for-sale and measured at the lower of cost or fair value and therefore included in the nonrecurring fair value assets.
- Gains of $4.5 billion related to structured notes, principally due to significant volatility in the equity markets.
- Net gains of $4.6 billion related to derivatives, principally due to changes in credit spreads and rate curves.

The Firm risk manages level 3 financial instruments using securities and derivative positions classified within level 1 or 2 of the valuation hierarchy; the effect of these risk management activities is not reflected in the level 3 gains and losses included in the tables above.

For further information on changes in the fair value of the MSRs, see Note 18 on pages 199–200 of this Annual Report.

Credit adjustments

When determining the fair value of an instrument, it may be necessary to record a valuation adjustment to arrive at an exit price in accordance with SFAS 157. Valuation adjustments include, but are not limited to, amounts to reflect counterparty credit quality and the Firm's own creditworthiness. For a detailed discussion of the valuation adjustments the Firm considers, see the valuation discussion at the beginning of this Note.

The following table provides the credit adjustments, gross of hedges where risk is actively managed, as reflected within the Consolidated Balance Sheets of the Firm as of the dates indicated.

Year ended December 31, (in millions)	**2008**	2007
Derivatives receivables balance	**$ 162,626**	$ 77,136
Derivatives CVA[(a)]	**(9,566)**	(1,265)
Derivatives payable balance	**121,604**	68,705
Derivatives DVA	**1,389**	518
Structured notes balance	**67,340**	87,622
Structured notes DVA[(b)]	**2,413**	896

(a) Derivative CVA, gross of hedges, includes results managed by Credit Portfolio and other lines of business within IB.

(b) Structured notes are carried at fair value based upon the Firm's election under SFAS 159. For further information on these elections, see Note 5 on page 156 of this Annual Report.

The following table provides the impact of credit adjustments, gross of hedges where risk is actively managed, on earnings in the respective periods.

Year ended December 31, (in millions)	**2008**	2007
Credit adjustments:		
Derivatives CVA[(a)]	**$ (7,561)**	$ (803)
Derivatives DVA	**789**	514
Structured Notes DVA[(b)]	**1,211**	806

(a) Derivative CVA, gross of hedges, includes results managed by Credit Portfolio and other lines of business within IB.

(b) Structured notes are carried at fair value based upon the Firm's election under SFAS 159. For further information on these elections, see Note 5 on page 156 of this Annual Report.

The market's view of the Firm's credit quality is reflected in credit spreads observed in the credit default swap market. These credit spreads are affected by a number of factors, such as the performance of the assets the Firm holds. Consequently, significant deterioration in the value of sizable exposures held by the Firm are likely to result in wider credit default swap spreads. This will lead to an increase in the Firm's credit adjustment (i.e., DVA) for liabilities carried at fair value.

Mortgage-related exposures carried at fair value

As noted above, certain of the Firm's wholesale and consumer loans are carried at fair value including mortgage-related loans. Since the second half of 2007, liquidity in certain sectors of the mortgage markets has decreased, thereby limiting the price transparency of certain mortgage-related instruments. The table below summarizes the Firm's mortgage-related exposures that are carried at fair value through earnings or at the lower of cost or fair value; the table excludes securities held in the available-for-sale portfolio.

	Exposure as of December 31, 2008		
(in millions)	Gross	Net of risk management activities[(d)]	Net gains/(losses)[(e)] reported in income – year ended December 31, 2008
U.S. Residential Mortgage:[(a)(b)(c)]			
Prime	$ 11,221	$ 5,044	
Alt-A	3,934	3,917	
	15,155	8,961	$ (1,468)
Subprime	941	(28)	(369)
Non-U.S. Residential	1,591	951	(292)
Commercial Mortgage:			
Securities	2,836	1,438	(792)
Loans	4,338	2,179	(752)

(a) Included exposures in IB and Retail Financial Services segments.

(b) Excluded from the table above are certain mortgage-related assets that are carried at fair value and recorded in trading assets, such as: (i) U.S. government agency and U.S. government-sponsored enterprise securities that are liquid and of high credit quality of $58.9 billion at December 31, 2008; and (ii) reverse mortgages of $4.3 billion at December 31, 2008, for which the principal risk is mortality risk. Also excluded are mortgage servicing rights, which are reported in Note 18 on pages 199–200 of this Annual Report.

(c) Also excluded from the table above are certain mortgage-related financing transactions, which are collateralized by mortgage-related assets, of $5.7 billion at December 31, 2008. These financing transactions are excluded from the table as they are accounted for on an accrual basis of accounting. For financings deemed to be impaired, impairment is measured and recognized based upon the fair value of the collateral. Of these financing transactions, $1.2 billion at December 31, 2008, was considered impaired.

(d) The amounts presented reflect the effects of derivatives utilized to risk manage the gross exposures arising from cash-based instruments and are presented on a bond or loan equivalent (notional) basis. Derivatives are excluded from the gross exposure as they are principally used for risk management purposes.

(e) Net gains and losses include all revenue related to the positions (i.e., interest income, changes in fair value of the assets, changes in fair value of the related risk management positions, and interest expense related to the liabilities funding the positions).

Residential mortgages

Prime Mortgage – The Firm had exposure of $11.2 billion to prime mortgages carried at fair value through earnings or at the lower of cost or fair value at December 31, 2008, which consisted of $2.9 billion of securities (including $1.2 billion of forward purchase commitments), largely rated "AAA", and $8.3 billion of first-lien mortgages.

Alt-A mortgage – The Firm had exposure of $3.9 billion to Alt-A mortgages carried at fair value through earnings or at the lower of cost or fair value at December 31, 2008, which consisted of $787 million of securities and $3.1 billion of first-lien mortgages.

Subprime mortgage – The Firm had exposure of $941 million to subprime mortgages carried at fair value through earnings or at the lower of cost or fair value at December 31, 2008, which included $680 million of securities and $261 million of first-lien mortgages.

Classification and Valuation

Residential mortgage loans and mortgage-backed securities are classified within level 2 or level 3 of the valuation hierarchy depending on the level of liquidity and activity in the markets for a particular product. Level 3 assets include residential whole loans, prime and Alt-A residential mortgage-backed securities rated below "AAA", subprime residential mortgage-backed securities and single-name CDS on ABS. Products that continue to have reliable price transparency as evidenced by consistent market transactions, such as AAA-rated prime and Alt-A securities, as well as agency securities, continue to be classified in level 2.

For those products classified within level 2 of the valuation hierarchy, the Firm estimates the value of such instruments using a combination of observed transaction prices, independent pricing services and relevant broker quotes. Consideration is given to the nature of the quotes (e.g., indicative or firm) and the relationship of recently evidenced market activity to the prices provided from independent pricing services.

When relevant market activity is not occurring or is limited, the fair value is estimated as follows:

Residential mortgage loans – Fair value of residential mortgage loans is estimated by projecting the expected cash flows and discounting those cash flows at a rate reflective of current market liquidity. To estimate the projected cash flows (inclusive of assumptions of prepayment, default rates and loss severity), specific consideration is given to both borrower-specific and other market factors including, but not limited to: the borrower's FICO score; the type of collateral supporting the loan; an estimate of the current value of the collateral supporting the loan; the level of documentation for the loan; and market-derived expectations for home price appreciation or depreciation in the respective geography of the borrower.

Residential mortgage-backed securities – Fair value of residential mortgage-backed securities is estimated considering the value of the collateral and the specific attributes of the securities held by the Firm. The value of the collateral pool supporting the securities is analyzed using the same techniques and factors described above for residential mortgage loans, albeit in a more aggregated manner across the pool. For example, average FICO scores, average delinquency rates, average loss severities and prepayment rates, among other metrics, may be evaluated. In addition, as each securitization vehicle distributes cash in a manner or order that is predetermined at the inception of the vehicle, the priority in which each particular mortgage-backed security is allocated cash flows, and the level of credit enhancement that is in place to support those cash flows, are key considerations in deriving the value of residential mortgage-backed securities. Finally, the risk premium that investors demand for securitized products in today's market is factored into the valuation. To benchmark its valuations, the Firm looks to transactions for similar instruments and utilizes independent pricing provided by third-party vendors, broker quotes and relevant market indices such as the ABX index, as applicable. While none of those sources are solely indicative of fair value, they serve as directional indicators for the appropriateness of the Firm's estimates.

Commercial mortgages

Commercial mortgages are loans to companies backed by commercial real estate. Commercial mortgage-backed securities are securities collateralized by a pool of commercial mortgages. Typically, commercial mortgages have lock-out periods, where the borrower is restricted from prepaying the loan for a specified timeframe, or periods where there are disincentives for the borrower to prepay the loan due to prepayment penalties. These features reduce prepayment risk for commercial mortgages relative to that of residential mortgages.

The Firm had exposure to $7.2 billion of commercial mortgage-backed assets carried at fair value through earnings or at the lower of cost or fair value at December 31, 2008, which consisted of $2.8 billion of securities, largely rated "AAA", and $4.4 billion of first-lien mortgages, largely in the U.S.

Classification and Valuation

While commercial mortgages and commercial mortgage-backed securities are classified within level 2 or level 3 of the valuation hierarchy, depending on the level of liquidity and activity in the markets, the majority of these mortgages, including both loans and lower-rated securities, are currently classified in level 3. Level 2 assets include AAA-rated fixed-rate commercial mortgage-backed securities.

Commercial mortgage loans – Fair value of commercial mortgage loans is estimated by projecting the expected cash flows and discounting those cash flows at a rate reflective of current market liquidity. To estimate the projected cash flows, consideration is given to both borrower-specific and other market factors including, but not limited to: the borrower's debt-to-service coverage ratio; the type of commercial property (e.g., retail, office, lodging, multi-family, etc.); an estimate of the current loan-to-value ratio; and market-derived expectations for property price appreciation or depreciation in the respective geographic location.

Commercial mortgage-backed securities – When relevant market activity is not present or is limited, the value of commercial mortgage-backed securities is estimated considering the value of the collateral and the specific attributes of the securities held by the Firm. The value of the collateral pool supporting the securities is analyzed using the same techniques and factors described above for the valuation of commercial mortgage loans, albeit in a more aggregated manner across the pool. For example, average delinquencies, loan or geographic concentrations and average debt-service coverage ratios, among other metrics, may be evaluated. In addition, as each securitization vehicle distributes cash in a manner or order that is predetermined at the inception of the vehicle, the priority in which each particular mortgage-backed security is allocated cash flows, and the level of credit enhancement that is in place to support those cash flows, are key considerations in deriving the value of commercial mortgage-backed securities. Finally, the risk premium that investors demand for securitized products in today's market is factored into the valuation. To benchmark its valuations, the Firm utilizes independent pricing provided by third-party vendors, and broker quotes, as applicable. While none of those sources are solely indicative of fair value, they serve as directional indicators for the appropriateness of the Firm's estimates.

The following table presents mortgage-related activities within the available-for-sale securities portfolio.

(in millions)	Exposures as of December 31, 2008	Net gains/(losses) reported in income – year ended December 31, 2008[(a)]	Unrealized gains/(losses) included in other comprehensive income (pretax) – year ended December 31, 2008
U.S. residential mortgage:			
Prime	$ 6,027	$ (32)	$ (1,769)
Alt-A	868	—	(196)
Subprime	194	(89)	(32)
Non-U.S. residential	2,075	2	(156)
Commercial mortgage	3,939	—	(684)
U.S. government and federal agency obligations:			
Mortgage-backed securities	$ 6,424	$ 23	$ 165
Collateralized mortgage obligations	558	(5)	(4)
U.S. government-sponsored enterprise obligations:			
Mortgage-backed securities	110,403	458	1,915
Direct obligations	9,657	11	(54)

(a) Excludes related net interest income.

Exposures in the table above include $140.1 billion of mortgage-backed securities classified as available-for-sale in the Firm's Consolidated Balance Sheets at December 31, 2008. These investments are primarily used as part of the Firm's centralized risk management of structural interest rate risk (the sensitivity of the Firm's aggregate balance sheet to changes in interest rates). Changes in the Firm's structural interest rate position, as well as changes in the overall interest rate environment, are continually monitored, resulting in periodic repositioning of mortgage-backed securities classified as available-for-sale. Given that this portfolio is primarily used to manage interest rate risk, predominantly all of these securities are backed by either U.S. government agencies, government sponsored entities, or they are rated "AAA".

Investment securities in the available-for-sale portfolio include:

- $6.9 billion of prime and Alt-A securities, principally rated "AAA". The fair value of these securities is determined based upon independent pricing services supported by relevant and observable market data for similar securities. The Firm classifies these securities in level 2 of the valuation hierarchy.
- $3.9 billion of commercial mortgage-backed securities, principally rated "AAA". The fair value of these securities is determined using a third party pricing service that uses relevant and observable market data. The Firm classifies these securities in level 2 of the valuation hierarchy.
- $127.0 billion of U.S. government agencies or U.S. government-sponsored enterprise mortgage-backed securities. Where these securities trade in active markets and there is market-observable pricing, they are classified in level 1 of the valuation hierarchy. Where the determination of fair value is based on broker quotes and independent pricing services, supported by relevant and observable market data, the Firm classifies such securities in level 2 of the valuation hierarchy.

SFAS 157 Transition
In connection with the initial adoption of SFAS 157, the Firm recorded the following on January 1, 2007:

- a cumulative effect increase to retained earnings of $287 million, primarily related to the release of profit previously deferred in accordance with EITF 02-3;
- an increase to pretax income of $166 million ($103 million after-tax) related to the incorporation of the Firm's creditworthiness in the valuation of liabilities recorded at fair value; and
- an increase to pretax income of $464 million ($288 million after-tax) related to valuations of nonpublic private equity investments.

Prior to the adoption of SFAS 157, the Firm applied the provisions of EITF 02-3 to its derivative portfolio. EITF 02-3 precluded the recognition of initial trading profit in the absence of: (a) quoted market prices, (b) observable prices of other current market transactions or (c) other observable data supporting a valuation technique. In accordance with EITF 02-3, the Firm recognized the deferred profit in principal transactions revenue on a systematic basis (typically straight-line amortization over the life of the instruments) and when observable market data became available.

Prior to the adoption of SFAS 157 the Firm did not incorporate an adjustment into the valuation of liabilities carried at fair value on the Consolidated Balance Sheets. Commencing January 1, 2007, in accordance with the requirements of SFAS 157, an adjustment was made to the valuation of liabilities measured at fair value to reflect the credit quality of the Firm.

Prior to the adoption of SFAS 157, privately held investments were initially valued based upon cost. The carrying values of privately held investments were adjusted from cost to reflect both positive and negative changes evidenced by financing events with third-party capital providers. The investments were also subject to ongoing impairment reviews by private equity senior investment professionals. The increase in pretax income related to nonpublic private equity investments in connection with the adoption of SFAS 157 was due to there being sufficient market evidence to support an increase in fair values using the SFAS 157 methodology, although there had not been an actual third-party market transaction related to such investments.

Financial disclosures required by SFAS 107
Many but not all of the financial instruments held by the Firm are recorded at fair value on the Consolidated Balance Sheets. SFAS 107 requires disclosure of the estimated fair value of certain financial instruments and the methods and significant assumptions used to estimate their fair value. Financial instruments within the scope of SFAS 107 are included in the table below. Additionally, certain financial instruments and all nonfinancial instruments are excluded from the scope of SFAS 107. Accordingly, the fair value disclosures required by SFAS 107 provide only a partial estimate of the fair value of JPMorgan Chase. For example, the Firm has developed long-term relationships with its customers through its deposit base and credit card accounts, commonly referred to as core deposit intangibles and credit card relationships. In the opinion of management, these items, in the aggregate, add significant value to JPMorgan Chase, but their fair value is not disclosed in this Note.

Financial instruments for which fair value approximates carrying value
Certain financial instruments that are not carried at fair value on the Consolidated Balance Sheets are carried at amounts that approximate fair value due to their short-term nature and generally negligible credit risk. These instruments include cash and due from banks, deposits with banks, federal funds sold and securities purchased under resale agreements and securities borrowed with short-dated maturities, short-term receivables and accrued interest receivable, commercial paper, federal funds purchased and securities loaned or sold under repurchase agreements with short-dated maturities, other borrowed funds (excluding advances from Federal Home Loan Banks), accounts payable and accrued liabilities. In addition, SFAS 107 requires that the fair value for deposit liabilities with no stated maturity (i.e., demand, savings and certain money market deposits) be equal to their carrying value. SFAS 107 does not allow for the recognition of the inherent funding value of these instruments.

The following table presents the carrying value and estimated fair value of financial assets and liabilities as required by SFAS 107 (a discussion of the valuation of the individual instruments can be found at the beginning of this Note or following the table below).

	2008			2007		
December 31, (in billions)	Carrying value	Estimated fair value	Appreciation/ (depreciation)	Carrying value	Estimated fair value	Appreciation/ (depreciation)
Financial assets						
Assets for which fair value approximates carrying value	**$ 226.0**	**$ 226.0**	**$ —**	$ 76.4	$ 76.4	$ —
Federal funds sold and securities purchased under resale agreements (included $20.8 and $19.1 at fair value at December 31, 2008 and 2007, respectively)	**203.1**	**203.1**	—	170.9	170.9	—

Net (depreciation) appreciation			**$(15.5)**			$ 0.9

(a) The fair value of interest-bearing deposits are estimated by discounting cash flows using the appropriate market rates for the applicable maturity.
(b) Fair value for long-term debt, including junior subordinated deferrable interest debentures held by trusts that issued guaranteed capital debt securities, is based upon current market rates and adjusted for JPMorgan Chase's credit quality.

The majority of the Firm's unfunded lending-related commitments are not carried at fair value on a recurring basis on the Consolidated Balance Sheets nor are they actively traded. Although there is no liquid secondary market for wholesale commitments, the Firm estimates the fair value of its wholesale lending-related commitments primarily using the cost of credit derivatives (which is adjusted to account for the difference in recovery rates between bonds, upon which the cost of credit derivatives is based, and loans) and loan equivalents (which represent the portion of an unused commitment expected, based upon the Firm's average portfolio historical experience, to become outstanding in the event an obligor defaults). On this basis, the estimated fair value of the Firm's lending-related commitments at December 31, 2008 and 2007, was a liability of $7.5 billion and $1.9 billion, respectively. The Firm does not estimate the fair value of consumer lending-related commitments. In many cases, the Firm can reduce or cancel these commitments by providing the borrower prior notice, or, in some cases, without notice as permitted by law.

Note 5 – Fair value option

In February 2007, the FASB issued SFAS 159, which was effective for fiscal years beginning after November 15, 2007, with early adoption permitted. The Firm chose early adoption for SFAS 159 effective January 1, 2007. SFAS 159 provides an option to elect fair value as an alternative measurement for selected financial assets, financial liabilities, unrecognized firm commitments, and written loan commitments not previously carried at fair value.

Elections

The following is a discussion of the primary financial instruments for which fair value elections were made and the basis for those elections:

Loans and unfunded lending-related commitments

On January 1, 2007, the Firm elected to record, at fair value, the following:

- Loans and unfunded lending-related commitments that are extended as part of IB's principal investing activities. The transition amount related to these loans included a reversal of the allowance for loan losses of $56 million.
- Certain loans held-for-sale. These loans were reclassified to trading assets – debt and equity instruments. This election enabled the Firm to record loans purchased as part of the Investment Bank's commercial mortgage securitization activity and proprietary activities at fair value and discontinue SFAS 133 fair value hedge relationships for certain originated loans.

Beginning on January 1, 2007, the Firm chose to elect fair value as the measurement attribute for the following loans originated or purchased after that date:

- Loans purchased or originated as part of IB's securitization warehousing activities.
- Prime mortgage loans originated with the intent to sell within Retail Financial Services ("RFS").

The election to fair value the above loans did not include loans within these portfolios that existed on January 1, 2007, based upon the short holding period of the loans and/or the negligible impact of the elections.

Warehouse loans elected to be reported at fair value are classified as trading assets – debt and equity instruments. For additional information regarding warehouse loans, see Note 16 on pages 180–188 of this Annual Report.

Beginning in the third quarter of 2007, the Firm elected the fair value option for newly originated bridge financing activity in IB. These elections were made to align further the accounting basis of the bridge financing activities with their related risk management practices. For these activities, the loans continue to be classified within loans on the Consolidated Balance Sheets; the fair value of the unfunded commitments is recorded within accounts payable and other liabilities.

Securities Financing Arrangements

On January 1, 2007, the Firm elected to record at fair value resale and repurchase agreements with an embedded derivative or a maturity of greater than one year. The intent of this election was to mitigate volatility due to the differences in the measurement basis for the agreements (which were previously accounted for on an accrual basis) and the associated risk management arrangements (which are accounted for on a fair value basis). An election was not made for short-term agreements, as the carrying value for such agreements generally approximates fair value. For additional information regarding these agreements, see Note 13 on pages 174–175 of this Annual Report.

In the second quarter of 2008, the Firm began electing the fair value option for newly transacted securities borrowed and securities lending agreements with a maturity of greater than one year. An election was not made for any short-term agreements, as the carrying value for such agreements generally approximates fair value.

Structured Notes

IB issues structured notes as part of its client-driven activities. Structured notes are financial instruments that contain embedded derivatives and are included in long-term debt. On January 1, 2007, the Firm elected to record at fair value all structured notes not previously elected or eligible for election under SFAS 155. The election was made to mitigate the volatility due to the differences in the measurement basis for structured notes and the associated risk management arrangements as well as to eliminate the operational burdens of having different accounting models for the same type of financial instrument.

Other

In the third quarter of 2008, the Firm elected the fair value option for the ABCP investments purchased under the Federal Reserve's AML Facility for U.S. money market mutual funds, as well as the related nonrecourse advance from the Federal Reserve Bank of Boston ("FRBB"). At December 31, 2008, ABCP investments of $11.2 billion were recorded in other assets; the corresponding nonrecourse liability to the FRBB in the same amount was recorded in other borrowed funds. For further discussion, see Note 21 on page 202 of this Annual Report.

In 2008, the Firm elected the fair value option for certain loans acquired as part of the Bear Stearns merger that were included in the trading portfolio and for prime mortgages previously designated as held-for-sale by Washington Mutual as part of the Washington Mutual transaction. In addition, the Firm elected the fair value option for certain tax credit and other equity investments acquired as part of the Washington Mutual transaction.

Changes in fair value under the fair value option election

The following table presents the changes in fair value included in the Consolidated Statements of Income for the years ended December 31, 2008 and 2007, for items for which the fair value election was made. The profit and loss information presented below only includes the financial instruments that were elected to be measured at fair value; related risk management instruments, which are required to be measured at fair value, are not included in the table.

	2008			2007		
December 31, (in millions)	Principal transactions[c]	Other income[c]	Total changes in fair value recorded	Principal transactions[c]	Other income[c]	Total changes in fair value recorded
Federal funds sold and securities purchased under resale agreements	**$ 1,139**	**$ —**	**$ 1,139**	$ 580	$ —	$ 580
Securities borrowed	**29**	**—**	**29**	—	—	—
Trading assets:						
Debt and equity instruments, excluding loans	**(870)**	**(58)**[d]	**(928)**	421	(1)[d]	420
Loans reported as trading assets:						
Changes in instrument-specific credit risk	**(9,802)**	**(283)**[d]	**(10,085)**	(517)	(157)[d]	(674)
Other changes in fair value	**696**	**1,178**[d]	**1,874**	188	1,033[d]	1,221
Loans:						
Changes in instrument-specific credit risk	**(1,991)**	**—**	**(1,991)**	102	—	102
Other changes in fair value	**(42)**	**—**	**(42)**	40	—	40
Other assets	**—**	**(660)**[e]	**(660)**	—	30[e]	30
Deposits[a]	**(132)**	**—**	**(132)**	(906)	—	(906)
Federal funds purchased and securities loaned or sold under repurchase agreements	**(127)**	**—**	**(127)**	(78)	—	(78)
Other borrowed funds[a]	**1,888**	**—**	**1,888**	(412)	—	(412)
Trading liabilities	**35**	**—**	**35**	(17)	—	(17)
Accounts payable and other liabilities	**—**	**—**	**—**	(460)	—	(460)
Beneficial interests issued by consolidated VIEs	**355**	**—**	**355**	(228)	—	(228)
Long-term debt:						
Changes in instrument-specific credit risk[a]	**1,174**	**—**	**1,174**	771	—	771
Other changes in fair value[b]	**16,202**	**—**	**16,202**	(2,985)	—	(2,985)

(a) Total changes in instrument-specific credit risk related to structured notes were $1.2 billion and $806 million for the years ended December 31, 2008 and 2007, respectively, which includes adjustments for structured notes classified within deposits and other borrowed funds, as well as long-term debt.

(b) Structured notes are debt instruments with embedded derivatives that are tailored to meet a client's need for derivative risk in funded form. The embedded derivative is the primary driver of risk. The 2008 gain included in "Other changes in fair value" results from a significant decline in the value of certain structured notes where the embedded derivative is principally linked to either equity indices or commodity prices, both of which declined sharply during the second half of 2008. Although the risk associated with the structured notes is actively managed, the balance reported in this table does not include the income statement impact of such risk management instruments.

(c) Included in the amounts are gains and losses related to certain financial instruments previously carried at fair value by the Firm, such as structured liabilities elected pursuant to SFAS 155 and loans purchased as part of the Investment Bank's trading activities.

(d) Reported in mortgage fees and related income.

(e) Reported in other income.

Determination of instrument-specific credit risk for items for which a fair value election was made

The following describes how the gains and losses included in earnings during 2008 and 2007, which were attributable to changes in instrument-specific credit risk, were determined.

- Loans and lending-related commitments: For floating-rate instruments, all changes in value are attributed to instrument-specific credit risk. For fixed-rate instruments, an allocation of the changes in value for the period is made between those changes in value that are interest rate-related and changes in value that are credit-related. Allocations are generally based upon an analysis of borrower-specific credit spread and recovery information, where available, or benchmarking to similar entities or industries.
- Long-term debt: Changes in value attributable to instrument-specific credit risk were derived principally from observable changes in the Firm's credit spread. The gain for 2008 and 2007 was attributable to the widening of the Firm's credit spread.
- Resale and repurchase agreements, securities borrowed agreements and securities lending agreements: Generally, for these types of agreements, there is a requirement that collateral be maintained with a market value equal to or in excess of the principal amount loaned; as a result, there would be no adjustment or an immaterial adjustment for instrument-specific credit risk related to these agreements.

Difference between aggregate fair value and aggregate remaining contractual principal balance outstanding

The following table reflects the difference between the aggregate fair value and the aggregate remaining contractual principal balance outstanding as of December 31, 2008 and 2007, for loans and long-term debt for which the SFAS 159 fair value option has been elected. The loans were classified in trading assets – debt and equity instruments or in loans.

	2008			2007		
December 31, (in millions)	Remaining aggregate contractual principal amount outstanding	Fair value	Fair value over (under) remaining aggregate contractual principal amount outstanding	Remaining aggregate contractual principal amount outstanding	Fair value	Fair value over (under) remaining aggregate contractual principal amount outstanding
Loans						
Performing loans 90 days or more past due						
Loans reported as trading assets	**$ —**	**$ —**	**$ —**	$ —	$ —	$ —
Loans	**—**	**—**	**—**	11	11	—
Nonaccrual loans						
Loans reported as trading assets	**7,454**	**1,519**	**(5,935)**	3,044	1,176	(1,868)
Loans	**189**	**51**	**(138)**	15	5	(10)
Subtotal	**7,643**	**1,570**	**(6,073)**	3,070	1,192	(1,878)
All other performing loans						
Loans reported as trading assets	**34,038**	**30,283**	**(3,755)**	56,164	56,638	474
Loans	**10,206**	**7,441**	**(2,765)**	9,011	8,580	(431)
Total loans	**$ 51,887**	**$ 39,294**	**$(12,593)**	$ 68,245	$ 66,410	$ (1,835)
Long-term debt						
Principal protected debt	**$ (27,043)**[b]	**$ (26,241)**	**$ (802)**	$ (24,262)[b]	$ (24,033)	$ (229)
Nonprincipal protected debt[a]	**NA**	**(31,973)**	**NA**	NA	(46,423)	NA
Total long-term debt	**NA**	**$ (58,214)**	**NA**	NA	$ (70,456)	NA
FIN 46R long-term beneficial interests						
Principal protected debt	**$ —**	**$ —**	**$ —**	$ (58)	$ (58)	$ —
Nonprincipal protected debt[a]	**NA**	**(1,735)**	**NA**	NA	(2,946)	NA
Total FIN 46R long-term beneficial interests	**NA**	**$ (1,735)**	**NA**	NA	$ (3,004)	NA

(a) Remaining contractual principal is not applicable to nonprincipal protected notes. Unlike principal protected notes for which the Firm is obligated to return a stated amount of principal at the maturity of the note, nonprincipal protected notes do not obligate the Firm to return a stated amount of principal at maturity but to return an amount based upon the performance of an underlying variable or derivative feature embedded in the note.

(b) Where the Firm issues principal protected zero coupon or discount notes, the balance reflected as the remaining contractual principal is the final principal payment at maturity.

The contractual amount of unfunded lending-related commitments for which the fair value option was elected was negligible at December 31, 2008. At December 31, 2007, the contractual amount of unfunded lending-related commitments for which the fair value option was elected was $1.0 billion with a corresponding fair value of $25 million. Such commitments are reflected as liabilities and included in accounts payable and other liabilities.

Note 6 – Principal transactions

Principal transactions revenue consists of realized and unrealized gains and losses from trading activities (including physical commodities inventories that are accounted for at the lower of cost or fair value), changes in fair value associated with financial instruments held by the Investment Bank for which the SFAS 159 fair value option was elected, and loans held-for-sale within the wholesale lines of business. For loans measured at fair value under SFAS 159, origination costs are recognized in the associated expense category as incurred. Principal transactions revenue also includes private equity gains and losses.

The following table presents principal transactions revenue.

Year ended December 31, (in millions)	**2008**	2007	2006
Trading revenue	**$ (9,791)**	$ 4,736	$ 9,418
Private equity gains (losses)[a]	**(908)**	4,279	1,360
Principal transactions	**$ (10,699)**	$ 9,015	$10,778

(a) Includes revenue on private equity investments held in the Private Equity business within Corporate/Private Equity and those held in other business segments.

Trading assets and liabilities

Trading assets include debt and equity instruments held for trading purposes that JPMorgan Chase owns ("long" positions), certain loans for which the Firm manages on a fair value basis and has elected the SFAS 159 fair value option, and physical commodities inventories that are accounted for at the lower of cost or fair value. Trading liabilities include debt and equity instruments that the Firm has sold to other parties but does not own ("short" positions). The Firm is obligated to purchase instruments at a future date to cover the short positions. Included in trading assets and trading liabilities are the reported receivables (unrealized gains) and payables (unrealized losses) related to derivatives. Trading assets and liabilities are carried at fair value on the Consolidated Balance Sheets. For a discussion of the valuation of trading assets and trading liabilities, see Note 5 on pages 156–158 of this Annual Report.

The following table presents the fair value of trading assets and trading liabilities for the dates indicated.

December 31, (in millions)	2008	2007
Trading assets		
Debt and equity instruments:[a]		
U.S. government and federal agency obligations:		
U.S. treasuries	**$ 22,121**	$ 32,378

Interest rate	**48,449**	25,542
Credit	**23,566**	11,613
Commodity	**11,921**	6,942
Foreign exchange	**20,352**	7,552
Equity	**17,316**	17,056
Total derivative payables	**121,604**	68,705
Total trading liabilities	**$166,878**	$157,867

(a) Prior periods have been revised to reflect the current presentation.
(b) Primarily represents securities sold, not yet purchased.

Included in trading assets and trading liabilities are the reported receivables (unrealized gains) and payables (unrealized losses) related to derivatives. As permitted under FIN 39, the Firm has elected to net derivative receivables and derivative payables and the related cash collateral received and paid when a legally enforceable master netting agreement exists. The netted amount of cash collateral received and paid was $103.6 billion and $72.4 billion, respectively, at December 31, 2008, and $34.9 billion and $24.6 billion, respectively, at December 31, 2007. The Firm received and paid excess collateral of $22.2 billion and $3.7 billion, respectively, at December 31, 2008, and $17.4 billion and $2.4 billion, respectively, at December 31, 2007. This additional collateral received and paid secures potential exposure that could arise in the derivatives portfolio should the mark-to-market of the transactions move in the Firm's favor or the client's favor, respectively, and is not nettable against the derivative receivables or payables in the table above. The above amounts also exclude liquid securities held and posted as collateral by the Firm to secure derivative receivables and derivative payables. Collateral amounts held and posted in securities form are not recorded on the Firm's balance sheet, and are therefore not nettable against derivative receivables. The Firm held securities collateral of $19.8 billion and $9.8 billion at December 31, 2008 and 2007, respectively, related to derivative receivables. The Firm posted $11.8 billion and $5.9 billion of securities collateral at December 31, 2008 and 2007, respectively, related to derivative payables.

Average trading assets and liabilities were as follows for the periods indicated.

Year ended December 31, (in millions)	2008	2007	2006
Trading assets – debt and equity instruments	**$ 384,102**	$ 381,415	$ 280,079
Trading assets – derivative receivables	**121,417**	65,439	57,368
Trading liabilities – debt and equity instruments[a]	**$ 78,841**	$ 94,737	$ 102,794
Trading liabilities – derivative payables	**93,200**	65,198	57,938

(a) Primarily represent securities sold, not yet purchased.

Private equity investments

Private equity investments are recorded in other assets on the Consolidated Balance Sheets. The following table presents the carrying value and cost of the private equity investment portfolio held by the Private Equity business within Corporate/Private Equity for the dates indicated.

December 31,	2008		2007	
(in millions)	Carrying value	Cost	Carrying value	Cost
Total private equity investments	**$6,852**	**$8,257**	$7,153	$6,231

The above private equity investments include investments in buyouts, growth equity and venture opportunities. These investments are accounted for under investment company guidelines. Accordingly, these investments, irrespective of the percentage of equity ownership interest held, are carried on the Consolidated Balance Sheets at fair value. Realized and unrealized gains and losses arising from changes in fair

value are reported in principal transactions revenue in the Consolidated Statements of Income in the period that the gains or losses are recognized. For a discussion of the valuation of private equity investments, see Note 5 on pages 156–158 of this Annual Report.

Note 7 – Other noninterest revenue

Investment banking fees

This revenue category includes advisory and equity and debt underwriting fees. Advisory fees are recognized as revenue when the related services have been performed. Underwriting fees are recognized as revenue when the Firm has rendered all services to the issuer and is entitled to collect the fee from the issuer, as long as there are no other contingencies associated with the fee (e.g., the fee is not contingent upon the customer obtaining financing). Underwriting fees are net of syndicate expense; the Firm recognizes credit arrangement and syndication fees as revenue after satisfying certain retention, timing and yield criteria.

The following table presents the components of Investment banking fees.

Year ended December 31, (in millions)	**2008**	2007	2006
Underwriting:			
Equity	**$ 1,477**	$ 1,713	$ 1,179
Debt	**2,094**	2,650	2,703
Total underwriting	**3,571**	4,363	3,882
Advisory	**1,955**	2,272	1,638
Total investment banking fees	**$ 5,526**	$ 6,635	$ 5,520

Lending & deposit-related fees

This revenue category includes fees from loan commitments, standby letters of credit, financial guarantees, deposit-related fees in lieu of compensating balances, cash management-related activities or transactions, deposit accounts and other loan-servicing activities. These fees are recognized over the period in which the related service is provided.

Asset management, administration and commissions

This revenue category includes fees from investment management and related services, custody, brokerage services, insurance premiums and commissions, and other products. These fees are recognized over the period in which the related service is provided. Performance-based fees, which are earned based upon exceeding certain benchmarks or other performance targets, are accrued and recognized at the end of the performance period in which the target is met.

The following table presents components of asset management, administration and commissions.

Year ended December 31, (in millions)	**2008**	2007	2006
Asset management:			
Investment management fees	**$ 5,562**	$ 6,364	$ 4,429
All other asset management fees	**432**	639	567
Total asset management fees	**5,994**	7,003	4,996
Total administration fees[(a)]	**2,452**	2,401	2,430
Commission and other fees:			
Brokerage commissions	**3,141**	2,702	2,184
All other commissions and fees	**2,356**	2,250	2,245
Total commissions and fees	**5,497**	4,952	4,429
Total asset management, administration and commissions	**$13,943**	$14,356	$11,855

(a) Includes fees for custody, securities lending, funds services and broker-dealer clearance.

Mortgage fees and related income

This revenue category primarily reflects Retail Financial Services' mortgage banking revenue, including: fees and income derived from mortgages originated with the intent to sell; mortgage sales and servicing; the impact of risk management activities associated with the mortgage pipeline, warehouse loans and MSRs; and revenue related to any residual interests held from mortgage securitizations. This revenue category also includes gains and losses on sales and lower of cost or fair value adjustments for mortgage loans held-for-sale, as well as changes in fair value for mortgage loans originated with the intent to sell and measured at fair value under SFAS 159. For loans measured at fair value under SFAS 159, origination costs are recognized in the associated expense category as incurred. Costs to originate loans held-for-sale and accounted for at the lower of cost or fair value are deferred and recognized as a component of the gain or loss on sale. Net interest income from mortgage loans and securities gains and losses on available-for-sale ("AFS") securities used in mortgage-related risk management activities are recorded in interest income and securities gains (losses), respectively. For a further discussion of MSRs, see Note 18 on pages 199–200 of this Annual Report.

Credit card income

This revenue category includes interchange income from credit and debit cards and servicing fees earned in connection with securitization activities. Volume-related payments to partners and expense for rewards programs are netted against interchange income; expense related to rewards programs are recorded when the rewards are earned by the customer, as more fully described below. Other fee revenue is recognized as earned, except for annual fees, which are deferred and recognized on a straight-line basis over the 12-month period to which they pertain. Direct loan origination costs are also deferred and recognized over a 12-month period. In addition, due to the consolidation of Chase Paymentech Solutions in the fourth quarter of 2008, this category now includes net fees earned for processing card transactions for merchants.

Credit card revenue sharing agreements

The Firm has contractual agreements with numerous affinity organizations and co-brand partners, which grant the Firm exclusive rights to market to the members or customers of such organizations and partners. These organizations and partners endorse the credit card programs and provide their mailing lists to the Firm, and they may also conduct marketing activities and provide awards under the various credit card programs. The terms of these agreements generally range from three to ten years. The economic incentives the Firm pays to the endorsing organizations and partners typically include payments based upon new account originations, charge volumes, and the cost of the endorsing organizations' or partners' marketing activities and awards.

The Firm recognizes the payments made to the affinity organizations and co-brand partners based upon new account originations as direct loan origination costs. Payments based upon charge volumes are considered by the Firm as revenue sharing with the affinity organizations and co-brand partners, which are deducted from interchange income as the related revenue is earned. Payments based upon marketing efforts undertaken by the endorsing organization or partner are expensed by the Firm as incurred. These costs are recorded within noninterest expense.

Note 8 – Interest income and Interest expense

Details of interest income and interest expense were as follows.

Year ended December 31, (in millions)	**2008**	2007	2006
Interest income[a]			
Loans[b]	**$38,347**	$ 36,660	$ 33,121
Securities[b]	**6,344**	5,232	4,147
Trading assets	**17,236**	17,041	10,942
Federal funds sold and securities purchased under resale agreements	**5,983**	6,497	5,578
Securities borrowed	**2,297**	4,539	3,402
Deposits with banks	**1,916**	1,418	1,265
Interests in purchased receivables[b]	—	—	652
Other assets[c]	**895**	—	—
Total interest income	**73,018**	71,387	59,107
Interest expense[a]			
Interest-bearing deposits	**14,546**	21,653	17,042
Short-term and other liabilities[d]	**10,933**	16,142	14,086
Long-term debt	**8,355**	6,606	5,503
Beneficial interests issued by consolidated VIEs	**405**	580	1,234
Total interest expense	**34,239**	44,981	37,865
Net interest income	**38,779**	26,406	21,242
Provision for credit losses	**19,445**	6,864	3,270
Provision for credit losses – accounting conformity[e]	**1,534**	—	—
Total provision for credit losses	**$20,979**	$ 6,864	$ 3,270
Net interest income after provision for credit losses	**$17,800**	$ 19,542	$ 17,972

(a) Interest income and interest expense include the current period interest accruals for financial instruments measured at fair value except for financial instruments containing embedded derivatives that would be separately accounted for in accordance with SFAS 133 absent the SFAS 159 fair value election; for those instruments, all changes in fair value, including any interest elements, are reported in principal transactions revenue.

(b) As a result of restructuring certain multi-seller conduits the Firm administers, JPMorgan Chase deconsolidated $29 billion of interests in purchased receivables, $3 billion of loans and $1 billion of securities and recorded $33 billion of lending-related commitments during 2006.

(c) Predominantly margin loans.

(d) Includes brokerage customer payables.

(e) Includes accounting conformity loan loss reserve provision related to the acquisition of Washington Mutual's banking operations.

Note 9 – Pension and other postretirement employee benefit plans

The Firm's defined benefit pension plans are accounted for in accordance with SFAS 87 and SFAS 88, and its other postretirement employee benefit ("OPEB") plans are accounted for in accordance with SFAS 106. In September 2006, the FASB issued SFAS 158, which requires companies to recognize on their Consolidated Balance Sheets the overfunded or underfunded status of their defined benefit postretirement plans, measured as the difference between the fair value of plan assets and the benefit obligation. SFAS 158 requires unrecognized amounts (e.g., net loss and prior service costs) to be recognized in accumulated other comprehensive income (loss) ("AOCI") and that these amounts be adjusted as they are subsequently recognized as components of net periodic benefit cost based upon the current amortization and recognition requirements of SFAS 87 and SFAS 106. The Firm prospectively adopted SFAS 158 on December 31, 2006, and recorded an after-tax charge to AOCI of $1.1 billion at that date.

SFAS 158 also eliminates the provisions of SFAS 87 and SFAS 106 that allow plan assets and obligations to be measured as of a date not more than three months prior to the reporting entity's balance sheet date. The Firm uses a measurement date of December 31 for its defined benefit pension and OPEB plans; therefore, this provision of SFAS 158 had no effect on the Firm's financial statements.

For the Firm's defined benefit pension plans, fair value is used to determine the expected return on plan assets. For the Firm's OPEB plans, a calculated value that recognizes changes in fair value over a five-year period is used to determine the expected return on plan assets. Amortization of net gains and losses is included in annual net periodic benefit cost if, as of the beginning of the year, the net gain or loss exceeds 10 percent of the greater of the projected benefit obligation or the fair value of the plan assets. Any excess, as well as prior service costs, are amortized over the average future service period of defined benefit pension plan participants, which for the U.S. defined benefit pension plan is currently nine years (the decrease of one year from the prior year in the assumptions is related to pension plan demographic assumption revisions at December 31, 2007, to reflect recent experience relating to the form and timing of benefit distributions and rates of turnover). For OPEB plans, any excess net gains and losses also are amortized over the average future service period, which is currently six years; however, prior service costs are amortized over the average years of service remaining to full eligibility age, which is currently four years. The amortization periods for net gains and losses and prior service costs for OPEB are unchanged from the prior year.

Defined benefit pension plans

The Firm has a qualified noncontributory U.S. defined benefit pension plan that provides benefits to substantially all U.S. employees. The U.S. plan employs a cash balance formula in the form of pay and interest credits to determine the benefits to be provided at retirement, based upon eligible compensation and years of service. Employees begin to accrue plan benefits after completing one year of service, and beginning January 1, 2008, benefits generally vest after three years of service. The Firm also offers benefits through defined benefit pension plans to qualifying employees in certain non-U.S. locations based upon factors such as eligible compensation, age and/or years of service.

It is the Firm's policy to fund the pension plans in amounts sufficient to meet the requirements under applicable employee benefit and local tax laws. On January 15, 2009, the Firm made a discretionary cash contribution to its U.S. defined benefit pension plan of $1.3 billion, funding the plan to the maximum allowable amount under applicable tax law. The expected amount of 2009 contributions to its non-U.S. defined benefit pension plans is $44 million, of which $20 million is contractually required. The amount of potential 2009 contributions to the United Kingdom ("U.K.") defined benefit plans is not reasonably estimable at this time.

JPMorgan Chase also has a number of defined benefit pension plans not subject to Title IV of the Employee Retirement Income Security Act. The most significant of these plans is the Excess Retirement Plan, pursuant to which certain employees earn pay and interest credits on compensation amounts above the maximum stipulated by law under a qualified plan. The Excess Retirement Plan had an unfunded projected benefit obligation in the amount of $273 million and $262 million, at December 31, 2008 and 2007, respectively.

Defined contribution plans

JPMorgan Chase offers several defined contribution plans in the U.S. and in certain non-U.S. locations, all of which are administered in accordance with applicable local laws and regulations. The most significant of these plans is The JPMorgan Chase 401(k) Savings Plan (the "401(k) Savings Plan"), which covers substantially all U.S. employees. The 401(k) Savings Plan allows employees to make pretax and Roth 401(k) contributions to tax-deferred investment portfolios. The JPMorgan Chase Common Stock Fund, which is an investment option under the 401(k) Savings Plan, is a nonleveraged employee stock ownership plan. The Firm matches eligible employee contributions up to a certain percentage of benefits-eligible compensation per pay period, subject to plan and legal limits. Employees begin to receive matching contributions after completing a one-year-of-service requirement and are immediately vested in the Firm's contributions when made. Employees with total annual cash compensation of $250,000 or more are not eligible for matching contributions. The 401(k) Savings Plan also permits discretionary profit-sharing contributions by participating companies for certain employees, subject to a specified vesting schedule.

OPEB plans

JPMorgan Chase offers postretirement medical and life insurance benefits to certain retirees and postretirement medical benefits to qualifying U.S. employees. These benefits vary with length of service and date of hire and provide for limits on the Firm's share of covered medical benefits. The medical benefits are contributory, while the life insurance benefits are noncontributory. Postretirement medical benefits also are offered to qualifying U.K. employees.

JPMorgan Chase's U.S. OPEB obligation is funded with corporate-owned life insurance ("COLI") purchased on the lives of eligible employees and retirees. While the Firm owns the COLI policies, COLI proceeds (death benefits, withdrawals and other distributions) may be used only to reimburse the Firm for its net postretirement benefit claim payments and related administrative expense. The U.K. OPEB plan is unfunded.

The following table presents the changes in benefit obligations and plan assets and funded status amounts reported on the Consolidated Balance Sheets for the Firm's U.S. and non-U.S. defined benefit pension and OPEB plans.

As of or for the year ended December 31, (in millions)	Defined benefit pension plans				OPEB plans[d]	
	U.S.		Non-U.S.			
	2008	2007	**2008**	2007	**2008**	2007
Change in benefit obligation

(a) Includes various defined benefit pension plans, which are individually immaterial.

The estimated pretax amounts that will be amortized from AOCI into net periodic benefit cost in 2009 are as follows.

	Defined benefit pension plans		OPEB plans	
Year ended December 31, 2009 (in millions)	U.S.	Non-U.S.	U.S.	Non-U.S.
Net loss	$ 301	$ 42	$ —	$ —
Prior service cost (credit)	4	—	(14)	—
Total	$ 305	$ 42	$ (14)	$ —

Plan assumptions

JPMorgan Chase's expected long-term rate of return for U.S. defined benefit pension and OPEB plan assets is a blended average of the investment advisor's projected long-term (10 years or more) returns for the various asset classes, weighted by the asset allocation. Returns on asset classes are developed using a forward-looking building-block approach and are not strictly based upon historical returns. Equity returns are generally developed as the sum of inflation, expected real earnings growth and expected long-term dividend yield. Bond returns are generally developed as the sum of inflation, real bond yield and risk spread (as appropriate), adjusted for the expected effect on returns from changing yields. Other asset-class returns are derived from their relationship to the equity and bond markets. Consideration was also given to current market conditions and the short-term portfolio mix of each Plan; as a result, the Firm has generally maintained the same expected return on assets from the prior year.

For the U.K. defined benefit pension plans, which represent the most significant of the non-U.S. defined benefit pension plans, procedures similar to those in the U.S. are used to develop the expected

long-term rate of return on defined benefit pension plan assets, taking into consideration local market conditions and the specific allocation of plan assets. The expected long-term rate of return on U.K. plan assets is an average of projected long-term returns for each asset class. The return on equities has been selected by reference to the yield on long-term U.K. government bonds plus an equity risk premium above the risk-free rate. The return on "AA"-rated long-term corporate bonds has been taken as the average yield on such bonds, adjusted for the expected downgrades and the expected narrowing of credit spreads over the long term.

The discount rate used in determining the benefit obligation under the U.S. defined benefit pension and OPEB plans was selected by reference to the yields on portfolios of bonds with maturity dates and coupons that closely match each of the plan's projected cash flows; such portfolios are derived from a broad-based universe of high-quality corporate bonds as of the measurement date. In years in which these hypothetical bond portfolios generate excess cash, such excess is assumed to be reinvested at the one-year forward rates implied by the Citigroup Pension Discount Curve published as of the measurement date. The discount rate for the U.K. defined benefit pension and OPEB plans represents a rate implied from the yield curve of the year-end iBoxx £ corporate "AA" 15-year-plus bond index (adjusted for expected downgrades in the underlying bonds comprising the index) with a duration corresponding to that of the underlying benefit obligations.

The following tables present the weighted-average annualized actuarial assumptions for the projected and accumulated postretirement benefit obligations and the components of net periodic benefit costs for the Firm's U.S. and non-U.S. defined benefit pension and OPEB plans, as of and for the periods indicated.

Weighted-average assumptions used to determine benefit obligations

	U.S.		Non-U.S.	
December 31,	**2008**	2007	**2008**	2007
Discount rate:				
Defined benefit pension plans	**6.65%**	6.60%	**2.00-6.20%**	2.25-5.80%
OPEB plans	**6.70**	6.60	**6.20**	5.80
Rate of compensation increase	**4.00**	4.00	**3.00-4.00**	3.00-4.25
Health care cost trend rate:				
Assumed for next year	**8.50**	9.25	**7.00**	5.75
Ultimate	**5.00**	5.00	**5.50**	4.00
Year when rate will reach ultimate	**2014**	2014	**2012**	2010

Weighted-average assumptions used to determine net periodic benefit costs

	U.S.			Non-U.S.		
Year ended December 31,	**2008**	2007	2006	**2008**	2007	2006
Discount rate:						
Defined benefit pension plans	**6.60%**	5.95%	5.70%	**2.25-5.80%**	2.25-5.10%	2.00-4.70%
OPEB plans	**6.60**	5.90	5.65	**5.80**	5.10	4.70
Expected long-term rate of return on plan assets:						
Defined benefit pension plans	**7.50**	7.50	7.50	**3.25-5.75**	3.25-5.60	3.25-5.50
OPEB plans	**7.00**	7.00	6.84	**NA**	NA	NA
Rate of compensation increase	**4.00**	4.00	4.00	**3.00-4.25**	3.00-4.00	3.00-3.75
Health care cost trend rate:						
Assumed for next year	**9.25**	10.00	10.00	**5.75**	6.63	7.50
Ultimate	**5.00**	5.00	5.00	**4.00**	4.00	4.00
Year when rate will reach ultimate	**2014**	2014	2013	**2010**	2010	2010

The following table presents the effect of a one-percentage-point change in the assumed health care cost trend rate on JPMorgan Chase's total service and interest cost and accumulated postretirement benefit obligation.

Year ended December 31, 2008 (in millions)	1-Percentage-point increase	1-Percentage-point decrease
Effect on total service and interest cost	$ 3	$ (3)
Effect on accumulated postretirement benefit obligation	45	(40)

At December 31, 2008, the Firm increased the discount rates used to determine its benefit obligations for the U.S. defined benefit pension and OPEB plans based upon current market interest rates, which will result in a decrease in expense of approximately $1.6 million for 2009. The 2009 expected long-term rate of return on U.S. pension plan assets and U.S. OPEB plan assets remained at 7.5% and 7.0%, respectively. The health care benefit obligation trend assumption declined from 9.25% in 2008 to 8.5% in 2009, declining to a rate of 5% in 2014. As of December 31, 2008, the interest crediting rate assumption and the assumed rate of compensation increase remained at 5.25% and 4.0%, respectively.

JPMorgan Chase's U.S. defined benefit pension and OPEB plan expense is sensitive to the expected long-term rate of return on plan assets and the discount rate. With all other assumptions held constant, a 25-basis point decline in the expected long-term rate of return on U.S. plan assets would result in an increase of approximately $23 million in 2009 U.S. defined benefit pension and OPEB plan expense. A 25-basis point decline in the discount rate for the U.S. plans would result in an increase in 2009 U.S. defined benefit pension and OPEB plan expense of approximately $9 million and an increase in the related projected benefit obligations of approximately $159 million. A 25-basis point decline in the discount rates for the non-U.S. plans would result in an increase in the 2009 non-U.S. defined benefit pension and OPEB plan expense of approximately $10 million. A 25-basis point increase in the interest crediting rate for the U.S. defined benefit pension plan would result in an increase in 2009 U.S. defined benefit pension expense of approximately $16 million and an increase in the related projected benefit obligations of approximately $66 million.

Investment strategy and asset allocation

The investment policy for the Firm's postretirement employee benefit plan assets is to optimize the risk-return relationship as appropriate to the respective plan's needs and goals, using a global portfolio of various asset classes diversified by market segment, economic sector and issuer. Specifically, the goal is to optimize the asset mix for future benefit obligations, while managing various risk factors and each plan's investment return objectives. For example, long-duration fixed income securities are included in the U.S. qualified pension plan's asset allocation, in recognition of its long-duration obligations. Plan assets are managed by a combination of internal and external investment managers and are rebalanced within approved ranges on a continued basis. The Firm reviews the allocation daily and all factors that impact portfolio changes to ensure the Plan stays within these ranges, rebalancing when deemed necessary.

The Firm's U.S. defined benefit pension plan assets are held in trust and invested in a well-diversified portfolio of equities (including U.S. large and small capitalization and international equities), fixed income (including corporate and government bonds, Treasury inflation-indexed and high-yield securities), real estate, cash equivalents and alternative investments. Non-U.S. defined benefit pension plan assets are held in various trusts and similarly invested in well-diversified portfolios of equity, fixed income and other securities. Assets of the Firm's COLI policies, which are used to fund partially the U.S. OPEB plan, are held in separate accounts with an insurance company and are invested in equity and fixed income index funds. As of December 31, 2008, assets held by the Firm's U.S. and non-U.S. defined benefit pension and OPEB plans do not include JPMorgan Chase common stock, except in connection with investments in third-party stock-index funds.

The following table presents the weighted-average asset allocation of the fair values of total plan assets at December 31 for the years indicated, as well as the respective approved range/target allocation by asset category, for the Firm's U.S. and non-U.S. defined benefit pension and OPEB plans.

	Defined benefit pension plans								
	U.S.			Non-U.S.			OPEB plans[a]		
	Target	% of plan assets		Target	% of plan assets		Target	% of plan assets

Years 2014–2018	3,333	571	513	87

Note 10 – Employee stock-based incentives

Effective January 1, 2006, the Firm adopted SFAS 123R and all related interpretations using the modified prospective transition method. SFAS 123R requires all share-based payments to employees, including employee stock options and stock appreciation rights ("SARs"), to be measured at their grant date fair values. The Firm also adopted the transition election provided by FSP FAS 123(R)-3.

Upon adopting SFAS 123R, the Firm began to recognize in the Consolidated Statements of Income compensation expense for unvested stock options previously accounted for under APB 25. Additionally, JPMorgan Chase recognized as compensation expense an immaterial cumulative effect adjustment resulting from the SFAS 123R requirement to estimate forfeitures at the grant date instead of recognizing them as incurred. Finally, the Firm revised its accounting policies for share-based payments granted to employees eligible for continued vesting under specific age and service or service-related provisions ("full-career eligible employees") under SFAS 123R. Prior to adopting SFAS 123R, the Firm's accounting policy for share-based payment awards granted to full-career eligible employees was to recognize compensation cost over the award's stated service period. Beginning with awards granted to full-career eligible employees in 2006, JPMorgan Chase recognized compensation expense on the grant date without giving consideration to the impact of post-employment restrictions. In the first quarter of 2006, the Firm also began to accrue the estimated cost of stock awards granted to full-career eligible employees in the following year.

In June 2007, the FASB ratified EITF 06-11, which requires that realized tax benefits from dividends or dividend equivalents paid on equity-classified share-based payment awards that are charged to retained earnings be recorded as an increase to additional paid-in capital and included in the pool of excess tax benefits available to absorb tax deficiencies on share-based payment awards. Prior to the issuance of EITF 06-11, the Firm did not include these tax benefits as part of this pool of excess tax benefits. The Firm adopted EITF 06-11 on January 1, 2008. The adoption of this consensus did not have an impact on the Firm's Consolidated Balance Sheets or results of operations.

In connection with the Bear Stearns merger, 46 million Bear Stearns employee stock awards, principally restricted stock units ("RSUs"), capital appreciation plan units and stock options, were exchanged for equivalent JPMorgan Chase awards using the merger exchange ratio of 0.21753. The fair value of these employee stock awards was included in the purchase price since substantially all of the awards were fully vested immediately after the merger date under provisions that provided for accelerated vesting upon a change of control of Bear Stearns. However, Bear Stearns vested employee stock options had no impact on the purchase price; since the employee stock options were significantly out of the money at the merger date, the fair value of these awards was equal to zero upon their conversion into JPMorgan Chase options.

The Firm also exchanged 6 million shares of its common stock for 27 million shares of Bear Stearns common stock held in an irrevocable grantor trust (the "RSU Trust") using the merger exchange ratio of 0.21753. The RSU Trust was established to hold common stock underlying awards granted to selected employees and key executives under certain Bear Stearns employee stock plans. The RSU Trust was consolidated on JPMorgan Chase's Consolidated Balance Sheets as of June 30, 2008, and the shares held in the RSU Trust were recorded in "Shares held in RSU Trust," which reduced stockholders' equity, similar to the treatment for treasury stock. A related obligation to issue stock under these employee stock plans is reported in capital surplus. The issuance of shares held in the RSU Trust to employees will not have any effect on the Firm's total stockholders' equity, net

income or earnings per share. Shares in the RSU Trust were distributed in 2008 with approximately half of the shares in the RSU Trust distributed in January 2009. The remaining shares are expected to be distributed over the next four years.

Employee stock-based awards

In 2008, 2007 and 2006, JPMorgan Chase granted long-term stock-based awards to certain key employees under the 2005 Long-Term Incentive Plan (the "2005 Plan"). The 2005 Plan, plus prior Firm plans and plans assumed as the result of acquisitions, constitute the Firm's stock-based incentive plans ("LTI Plan"). The 2005 Plan became effective on May 17, 2005, after approval by shareholders at the 2005 annual meeting. In May 2008, the 2005 Plan was amended and under the terms of the amended plan as of December 31, 2008, 348 million shares of common stock are available for issuance through May 2013. The amended 2005 Plan is the only active plan under which the Firm is currently granting stock-based incentive awards.

RSUs are awarded at no cost to the recipient upon their grant. RSUs are generally granted annually and generally vest 50 percent after two years and 50 percent after three years and convert to shares of common stock at the vesting date. In addition, RSUs typically include full-career eligibility provisions, which allow employees to continue to vest upon voluntary termination, subject to post-employment and other restrictions. All of these awards are subject to forfeiture until the vesting date. An RSU entitles the recipient to receive cash payments equivalent to any dividends paid on the underlying common stock during the period the RSU is outstanding.

Under the LTI Plan, stock options and SARs have been granted with an exercise price equal to the fair value of JPMorgan Chase's common stock on the grant date. The Firm typically awards SARs to certain key employees once per year, and it also periodically grants discretionary stock-based incentive awards to individual employees, primarily in the form of both employee stock options and SARs. The 2008 and 2007 grants of SARs to key employees vest ratably over five years (i.e., 20% per year) and the 2006 awards vest one-third after each of years three, four, and five. These awards do not include any full-career eligibility provisions and all awards generally expire ten years after the grant date.

The Firm separately recognizes compensation expense for each tranche of each award as if it were a separate award with its own vesting date. For each tranche granted (other than grants to employees who are full-career eligible at the grant date), compensation expense is recognized on a straight-line basis from the grant date until the vesting date of the respective tranche, provided that the employees will not become full-career eligible during the vesting period. For each tranche granted to employees who will become full-career eligible during the vesting period, compensation expense is recognized on a straight-line basis from the grant date until the earlier of the employee's full-career eligibility date or the vesting date of the respective tranche.

The Firm's policy for issuing shares upon settlement of employee stock-based incentive awards is to issue either new shares of common stock or treasury shares. During 2008 and 2007, the Firm settled all of its employee stock-based awards by issuing treasury shares. During 2006, the Firm settled all of its employee stock-based awards by issuing new shares of common stock from January 1 through May 31, 2006, and by issuing treasury shares thereafter.

In January 2008, the Firm awarded to its Chairman and Chief Executive Officer up to two million SARs. The terms of this award are distinct from, and more restrictive than, other equity grants regularly awarded by the Firm. The SARs, which have a ten-year term, will become exercisable no earlier than January 22, 2013, and have an exercise price of $39.83, the price of JPMorgan Chase common stock on the date of the award. The number of SARs that will become exercisable (ranging from none to the full two million) and their exercise date or dates may be determined by the Board of Directors based on an assessment of the performance of both the CEO and JPMorgan Chase. That assessment will be made by the Board in the year prior to the fifth anniversary of the date of the award, relying on such factors that in its sole discretion the Board deems appropriate. Due to the substantial uncertainty surrounding the number of SARs that will ultimately be granted and their exercise dates, a grant date has not been established for accounting purposes. However, since the service inception date precedes the grant date, the Firm will recognize this award ratably over an assumed five-year service period, subject to a requirement to recognize changes in the fair value of the award through the grant date. The Firm recognized $1 million in compensation expense in 2008 for this award.

RSU activity

Compensation expense for RSUs is measured based upon the number of shares granted multiplied by the stock price at the grant date and is recognized in net income as previously described. The following table summarizes JPMorgan Chase's RSU activity for 2008.

Year ended December 31, 2008 (in thousands, except weighted average data)	Number of Shares	Weighted-average grant date fair value
Outstanding, January 1	99,017	$ 43.11
Granted	85,890	40.37
Bear Stearns conversion	5,975	42.24
Vested	(36,606)	38.95
Forfeited	(6,232)	42.90
Outstanding, December 31	148,044	$ 42.53

The total fair value of shares that vested during the years ended December 31, 2008, 2007 and 2006, was $1.6 billion, $1.5 billion and $1.3 billion, respectively.

Employee stock option and SARs activity

Compensation expense, which is measured at the grant date as the fair value of employee stock options and SARs, is recognized in net income as described above.

The following table summarizes JPMorgan Chase's employee stock option and SARs activity for the year ended December 31, 2008, including awards granted to key employees and awards granted in prior years under broad-based plans.

Year ended December 31, 2008

(in thousands, except weighted-average data)	Number of options/SARs	Weighted-average exercise price	Weighted-average remaining contractual life (in years)	Aggregate intrinsic value
Outstanding, January 1	325,931	$ 41.70		
Granted	9,341	41.37		
Bear Stearns conversion	3,906	399.91		
Exercised	(34,761)	33.73		
Forfeited	(3,382)	44.13		
Canceled	(17,666)	47.61		
Outstanding, December 31	283,369	$ 47.21	3.5	$ 224,632
Exercisable, December 31	242,653	47.85	2.7	224,632

The weighted-average grant date per share fair value of stock options and SARs granted during the years ended December 31, 2008, 2007 and 2006, was $10.36, $13.38 and $10.99, respectively. The total intrinsic value of options exercised during the years ended December 31, 2008, 2007 and 2006 was $391 million, $937 million and $994 million, respectively.

Impact of adoption of SFAS 123R

During 2006, the incremental expense related to the Firm's adoption of SFAS 123R was $712 million. This amount represents an accelerated noncash recognition of costs that would otherwise have been incurred in future periods. Also, as a result of adopting SFAS 123R, the Firm's income from continuing operations (pretax) for the year ended December 31, 2006, was lower by $712 million, and each of income from continuing operations (after-tax) and net income for the year ended December 31, 2006, was lower by $442 million, than if the Firm had continued to account for stock-based incentives under APB 25 and SFAS 123. Basic and diluted earnings per share from continuing operations, as well as basic and diluted net income per share, for the year ended December 31, 2006 were $.13 and $.12 lower, respectively, than if the Firm had not adopted SFAS 123R.

Compensation expense

The Firm recognized noncash compensation expense related to its various employee stock-based incentive awards of $2.6 billion, $2.0 billion and $2.4 billion (including the $712 million incremental impact of adopting SFAS 123R) for the years ended December 31, 2008, 2007, and 2006, respectively, in its Consolidated Statements of Income. These amounts included an accrual for the estimated cost of stock awards to be granted to full-career eligible employees of $409 million, $500 million and $498 million for the years ended December 31, 2008, 2007 and 2006, respectively. At December 31, 2008, approximately $1.9 billion (pretax) of compensation cost related to unvested awards has not yet been charged to net income. That cost is expected to be amortized into compensation expense over a weighted-average period of 1.3 years. The Firm does not capitalize any compensation cost related to share-based compensation awards to employees.

Cash flows and tax benefits

The total income tax benefit related to stock-based incentive arrangements recognized in the Firm's Consolidated Statements of Income for the years ended December 31, 2008, 2007 and 2006, was $1.1 billion, $810 million and $947 million, respectively.

The following table sets forth the cash received from the exercise of stock options under all stock-based incentive arrangements and the actual tax benefit realized related to the tax deduction from the exercise of stock options.

Year ended December 31, (in millions)	**2008**	2007	2006
Cash received for options exercised	**$ 1,026**	$ 2,023	$ 1,924
Tax benefit realized	**72**	238	211

Valuation assumptions

The following table presents the assumptions used to value employee stock options and SARs granted during the period under the Black-Scholes valuation model.

Year ended December 31,	**2008**	2007	2006
Weighted-average annualized valuation assumptions			
Risk-free interest rate	**3.90%**	4.78%	5.11%
Expected dividend yield	**3.57**	3.18	2.89
Expected common stock price volatility	**34**	33	23
Expected life (in years)	**6.8**	6.8	6.8

Prior to the adoption of SFAS 123R, the Firm used the historical volatility of its common stock price as the expected volatility assumption in valuing options. The Firm completed a review of its expected volatility assumption in 2006. Effective October 1, 2006, JPMorgan Chase began to value its employee stock options granted or modified after that date using an expected volatility assumption derived from the implied volatility of its publicly traded stock options.

The expected life assumption is an estimate of the length of time that an employee might hold an option or SAR before it is exercised or canceled. The expected life assumption was developed using historic experience.

Note 11 – Noninterest expense

Merger costs

Costs associated with the Bear Stearns merger and the Washington Mutual transaction in 2008, the 2004 merger with Bank One Corporation, and The Bank of New York, Inc. ("The Bank of New York") transaction in 2006 are reflected in the merger costs caption of the Consolidated Statements of Income. For a further discussion of the Bear Stearns merger and the Washington Mutual transaction, see Note 2 on pages 135–140 of this Annual Report. A summary of merger-related costs is shown in the following table.

	2008				
Year ended December 31, (in millions)	Bear Stearns	Washington Mutual	Total	2007[b]	2006[b]
Expense category					
Compensation	**$ 181**	**$ 113**	**$ 294**	$ (19)	$ 26
Occupancy	**42**	**—**	**42**	17	25
Technology and communications and other	**85**	**11**	**96**	188	239
The Bank of New York transaction	**—**	**—**	**—**	23	15
Total[a]	**$ 308**	**$ 124**	**$ 432**	$ 209	$ 305

(a) With the exception of occupancy and technology-related write-offs, all of the costs in the table required the expenditure of cash.
(b) The 2007 and 2006 activity reflect the 2004 merger with Bank One Corporation and the Bank of New York transaction.

The table below shows the change in the merger reserve balance related to the costs associated with the transactions.

	2008				
Year ended December 31, (in millions)	Bear Stearns	Washington Mutual	Total	2007[a]	2006[a]
Merger reserve balance, beginning of period	**$ —**	**$ —**	**$ —**	$ 155	$ 311
Recorded as merger costs	**308**	**124**	**432**	186	290
Included in net assets acquired	**1,112**	**435**	**1,547**	(60)	—
Utilization of merger reserve	**(1,093)**	**(118)**	**(1,211)**	(281)	(446)
Merger reserve balance, end of period	**$ 327**	**$ 441**	**$ 768**	$ —[b]	$ 155[b]

(a) The 2007 and 2006 activity reflect the 2004 merger with Bank One Corporation.
(b) Excludes $10 million and $21 million at December 31, 2007 and 2006, respectively, related to the Bank of New York transaction.

Note 12 – Securities

Securities are classified as AFS, held-to-maturity ("HTM") or trading. Trading securities are discussed in Note 6 on pages 158–160 of this Annual Report. Securities are classified primarily as AFS when used to manage the Firm's exposure to interest rate movements, as well as to make strategic longer-term investments. AFS securities are carried at fair value on the Consolidated Balance Sheets. Unrealized gains and losses, after any applicable SFAS 133 hedge accounting adjustments, are reported as net increases or decreases to accumulated other comprehensive income (loss). The specific identification method is used to determine realized gains and losses on AFS securities, which are included in securities gains (losses) on the Consolidated Statements of Income. Securities that the Firm has the positive intent and ability to hold to maturity are classified as HTM and are carried at amortized cost on the Consolidated Balance Sheets. The Firm has not classified new purchases of securities as HTM for the past several years.

The following table presents realized gains and losses from AFS securities.

Year ended December 31, (in millions)	**2008**	2007	2006
Realized gains	**$ 1,890**	$ 667	$ 399
Realized losses	**(330)**[b]	(503)	(942)
Net realized securities gains (losses)[a]	**$ 1,560**	$ 164	$ (543)

(a) Proceeds from securities sold were within approximately 2% of amortized cost.
(b) 2008 includes $76 million of losses due to the other-than-temporary impairment of subprime mortgage-backed securities.

The amortized cost and estimated fair value of AFS and HTM securities were as follows for the dates indicated.

	2008				2007

AFS securities in unrealized loss positions are analyzed in depth as part of the Firm's ongoing assessment of other-than-temporary impairment. Potential other-than-temporary impairment of AFS securities is considered using a variety of factors, including the length of time and extent to which the market value has been less than cost; the financial condition and near-term prospects of the issuer or underlying collateral of a security; and the Firm's intent and ability to retain the security in order to allow for an anticipated recovery in fair value. Where applicable under EITF Issue 99-20, the Firm estimates the cash flows over the life of the security to determine if any adverse changes have occurred that require an other-than-temporary impairment charge. The Firm applies EITF Issue 99-20 to beneficial interests in securitizations that are rated below "AA" at acquisition or that can be contractually prepaid or otherwise settled in such a way that the Firm would not recover substantially all of its recorded investment. The Firm considers a decline in fair value to be other-than-temporary if it is probable that the Firm will not recover its recorded investment, including as applicable under EITF Issue 99-20, when an adverse change in cash flows has occurred.

The Firm's analysis of the financial condition and near term prospects of the issuer or underlying collateral of a security noted above includes analysis of performance indicators relevant to the specific investment. For asset-backed investments, such relevant performance indicators may include ratings, valuation of subordinated positions in current and/or stress scenarios, excess spread or overcollateralization levels, and whether certain protective triggers have been reached. For mortgage-backed investments, such relevant performance indicators may include ratings, prepayment speeds, delinquencies, default rates, loss severities, geographic concentration, and forecasted performance under various home price decline stress scenarios.

As of December 31, 2008, approximately $438 million of the unrealized losses relate to securities that have been in an unrealized loss position for longer than 12 months, and primarily relate to prime mortgage-backed securities and credit card-related asset-backed securities. The prime mortgage-backed securities are primarily rated "AAA", while the credit card-related asset-backed securities are rated "BBB". Based upon the analyses described above, which have been applied to these securities, the Firm believes that the unrealized losses result from liquidity conditions in the current market environment and not from concerns regarding the credit of the issuers or underlying collateral. The Firm does not believe it is probable that it will not recover its investments, given the current levels of collateral and credit enhancements that exist to protect the investments. For securities analyzed for impairment under EITF 99-20, the collateral and credit enhancement features are at levels sufficient to ensure that an adverse change in expected future cash flows has not occurred.

As of December 31, 2008, approximately $6.2 billion of the unrealized losses relate to securities that have been in an unrealized loss position for less than 12 months; these losses largely relate to credit

card-related asset-backed securities, mortgage-backed securities issued by private issuers and commercial and industrial asset-backed securities. Of the $2.0 billion of unrealized losses related to credit card-related asset-backed securities, $1.7 billion relates to purchased credit card-related asset-backed securities, and $304 million relates to retained interests in the Firm's own credit card receivable securitizations. The credit card-related asset-backed securities include "AAA", "A" and "BBB" ratings. Based on the levels of excess spread available to absorb credit losses, and based on the value of interests subordinate to the Firm's interests where applicable, the Firm does not believe it is probable that it will not recover its investments. Where applicable under EITF 99-20, the collateral and credit enhancement features are at levels sufficient to ensure that an adverse change in expected future cash flows has not occurred. Of the remaining unrealized losses as of December 31, 2008, related to securities that have been in an unrealized loss position for less than 12 months, $2.7 billion relates to mortgage-backed securities issued by private issuers and $820 million relates to commercial and industrial asset-backed securities. The mortgage-backed securities and commercial and industrial asset-backed securities are predominantly rated "AAA". Based on an analysis of the performance indicators noted above for mortgage-backed securities and asset-backed securities, which have been applied to the loans underlying these securities, the Firm does not believe it is probable that it will not recover its investments in these securities.

The Firm intends to hold the securities in an unrealized loss position for a period of time sufficient to allow for an anticipated recovery in fair value or maturity. The Firm has sufficient capital and liquidity to hold these securities until recovery in fair value or maturity. Based on the Firm's evaluation of the factors and other objective evidence described above, the Firm believes that the securities are not other-than-temporarily impaired as of December 31, 2008.

The following table presents the amortized cost, estimated fair value and average yield at December 31, 2008, of JPMorgan Chase's AFS and HTM securities by contractual maturity.

By remaining maturity at **December 31, 2008** (in millions, except ratios)	Available-for-sale securities			Held-to-maturity securities		
	Amortized cost	Fair value	Average yield[(b)]	Amortized cost	Fair value	Average yield[(b)]
Due in one year or less	$ 24,163	$ 24,056	2.80%	$ —	$ —	—%
Due after one year through five years	26,115	25,075	2.46	—	—	—
Due after five years through ten years	13,105	12,436	3.78	31	32	6.89
Due after ten years[(a)]	145,945	144,342	5.19	3	3	5.69
Total securities	$ 209,328	$ 205,909	4.49%	$ 34	$ 35	6.78%

(a) Includes securities with no stated maturity. Substantially all of the Firm's mortgage-backed securities and collateralized mortgage obligations are due in ten years or more based upon contractual maturity. The estimated duration, which reflects anticipated future prepayments based upon a consensus of dealers in the market, is approximately four years for mortgage-backed securities and collateralized mortgage obligations.

(b) The average yield is based upon amortized cost balances at year-end. Yields are derived by dividing interest income by total amortized cost. Taxable-equivalent yields are used where applicable.

Note 13 – Securities financing activities

JPMorgan Chase enters into resale agreements, repurchase agreements, securities borrowed transactions and securities loaned transactions, primarily to finance the Firm's inventory positions, acquire securities to cover short positions and settle other securities obligations. The Firm also enters into these transactions to accommodate customers' needs.

Resale agreements and repurchase agreements are generally treated as collateralized financing transactions carried on the Consolidated Balance Sheets at the amounts the securities will be subsequently sold or repurchased, plus accrued interest. On January 1, 2007, pursuant to the adoption of SFAS 159, the Firm elected fair value measurement for certain resale and repurchase agreements. In 2008, the Firm elected fair value measurement for certain newly transacted securities borrowed and securities lending agreements. For a further discussion of SFAS 159, see Note 5 on pages 156–158 of this Annual Report. The securities financing agreements for which the fair value option was elected continue to be reported within securities purchased under resale agreements; securities loaned or sold under repurchase agreements; securities borrowed; and other borrowed funds on the Consolidated Balance Sheets. Generally, for agreements carried at fair value, current-period interest accruals are recorded within interest income and interest expense, with changes in fair value reported in principal transactions revenue. However, for financial instruments containing embedded derivatives that would be separately accounted for in accordance with SFAS 133, all changes in fair value, including any interest elements, are reported in principal transactions revenue. Where appropriate, resale and repurchase agreements with the same counterparty are reported on a net basis in accordance with FIN 41. JPMorgan Chase takes possession of securities purchased under resale agreements. On a daily basis, JPMorgan Chase monitors the market value of the underlying collateral, primarily U.S. and non-U.S. government and agency securities, that it has received from its counterparties, and requests additional collateral when necessary.

Transactions similar to financing activities that do not meet the SFAS 140 definition of a repurchase agreement are accounted for as "buys" and "sells" rather than financing transactions. These transactions are accounted for as a purchase (sale) of the underlying securities with a forward obligation to sell (purchase) the securities. The forward purchase (sale) obligation, a derivative, is recorded on the Consolidated Balance Sheets at its fair value, with changes in fair value recorded in principal transactions revenue.

Securities borrowed and securities lent are recorded at the amount of cash collateral advanced or received. Securities borrowed consist primarily of government and equity securities. JPMorgan Chase monitors the market value of the securities borrowed and lent on a daily basis and calls for additional collateral when appropriate. Fees received or paid in connection with securities borrowed and lent are recorded in interest income or interest expense.

The following table details the components of collateralized financings.

December 31, (in millions)	**2008**	2007
Securities purchased under resale agreements[a]	**$ 200,265**	$ 169,305
Securities borrowed[b]	**124,000**	84,184
Securities sold under repurchase agreements[c]	**$ 174,456**	$ 126,098
Securities loaned	**6,077**	10,922

(a) Includes resale agreements of $20.8 billion and $19.1 billion accounted for at fair value at December 31, 2008 and 2007, respectively.
(b) Includes securities borrowed of $3.4 billion accounted for at fair value at December 31, 2008.
(c) Includes repurchase agreements of $3.0 billion and $5.8 billion accounted for at fair value at December 31, 2008 and 2007, respectively.

JPMorgan Chase pledges certain financial instruments it owns to collateralize repurchase agreements and other securities financings. Pledged securities that can be sold or repledged by the secured party are identified as financial instruments owned (pledged to various parties) on the Consolidated Balance Sheets.

At December 31, 2008, the Firm received securities as collateral that could be repledged, delivered or otherwise used with a fair value of approximately $511.9 billion. This collateral was generally obtained under resale or securities borrowing agreements. Of these securities, approximately $456.6 billion were repledged, delivered or otherwise used, generally as collateral under repurchase agreements, securities lending agreements or to cover short sales.

Note 14 – Loans

The accounting for a loan may differ based upon whether it is originated or purchased and as to whether the loan is used in an investing or trading strategy. For purchased loans held-for-investment, the accounting also differs depending on whether a loan is credit-impaired at the date of acquisition. Purchased loans with evidence of credit deterioration since the origination date and for which it is probable, at acquisition, that all contractually required payments receivable will not be collected are considered to be credit-impaired. The measurement framework for loans in the Consolidated Financial Statements is one of the following:

- At the principal amount outstanding, net of the allowance for loan losses, unearned income and any net deferred loan fees or costs, for loans held for investment (other than purchased credit-impaired loans);
- At the lower of cost or fair value, with valuation changes recorded in noninterest revenue, for loans that are classified as held-for-sale; or
- At fair value, with changes in fair value recorded in noninterest revenue, for loans classified as trading assets or risk managed on a fair value basis;
- Purchased credit-impaired loans held for investment are accounted for under SOP 03-3 and initially measured at fair value, which includes estimated future credit losses. Accordingly, an allowance for loan losses related to these loans is not recorded at the acquisition date.

See Note 5 on pages 156–158 of this Annual Report for further information on the Firm's elections of fair value accounting under SFAS 159. See Note 6 on pages 158–160 of this Annual Report for further information on loans carried at fair value and classified as trading assets.

For loans held for investment, other than purchased credit-impaired loans, interest income is recognized using the interest method or on a basis approximating a level rate of return over the term of the loan.

Loans within the held-for-investment portfolio that management decides to sell are transferred to the held-for-sale portfolio. Transfers to held-for-sale are recorded at the lower of cost or fair value on the date of transfer. Credit-related losses are charged off to the allowance for loan losses and losses due to changes in interest rates, or exchange rates, are recognized in noninterest revenue.

Loans within the held-for-sale portfolio that management decides to retain are transferred to the held-for-investment portfolio at the lower of cost or fair value. These loans are subsequently assessed for impairment based on the Firm's allowance methodology. For a further discussion of the methodologies used in establishing the Firm's allowance for loan losses, see Note 15 on pages 178–180 of this Annual Report.

Nonaccrual loans are those on which the accrual of interest is discontinued. Loans (other than certain consumer and purchased credit-impaired loans discussed below) are placed on nonaccrual status immediately if, in the opinion of management, full payment of principal or interest is in doubt, or when principal or interest is 90 days or more past due and collateral, if any, is insufficient to cover principal and interest. Loans are charged off to the allowance for loan losses when it is highly certain that a loss has been realized. Interest accrued but not collected at the date a loan is placed on nonaccrual status is reversed against interest income. In addition, the amortization of net deferred loan fees is suspended. Interest income on nonaccrual loans is recognized only to the extent it is received in cash. However, where there is doubt regarding the ultimate collectibility of loan principal, all cash thereafter received is applied to reduce the carrying value of such loans (i.e., the cost recovery method). Loans are restored to accrual status only when future payments of interest and principal are reasonably assured.

Consumer loans, other than purchased credit-impaired loans, are generally charged to the allowance for loan losses upon reaching specified stages of delinquency, in accordance with the Federal Financial Institutions Examination Council policy. For example, credit card loans are charged off by the end of the month in which the account becomes 180 days past due or within 60 days from receiving notification of the filing of bankruptcy, whichever is earlier. Residential mortgage products are generally charged off to net realizable value at no later than 180 days past due. Other consumer

products, if collateralized, are generally charged off to net realizable value at 120 days past due. Accrued interest on residential mortgage products, automobile financings, student loans and certain other consumer loans are accounted for in accordance with the nonaccrual loan policy discussed in the preceding paragraph. Interest and fees related to credit card loans continue to accrue until the loan is charged off or paid in full. Accrued interest on all other consumer loans is generally reversed against interest income when the loan is charged off. A collateralized loan is reclassified to assets acquired in loan satisfactions, within other assets, only when JPMorgan Chase has taken physical possession of the collateral, regardless of whether formal foreclosure proceedings have taken place.

For purchased credit-impaired loans, the excess of the loan's cash flows expected to be collected over the initial fair value (i.e., the accretable yield) is accreted into interest income at a level rate of return over the term of the loan, provided that the timing and amount of future cash flows is reasonably estimable. On a periodic basis, the Firm updates the amount of cash flows expected to be collected for these loans, incorporating assumptions regarding default rates, loss severities, the amounts and timing of prepayments and other factors that are reflective of current market conditions. Probable and significant increases in cash flows previously expected to be collected would first be used to reverse any related valuation allowance; any remaining increases are recognized prospectively as interest income. Probable decreases in expected cash flows after the acquisition date, excluding decreases related to repricings of variable rate loans, are recognized through the allowance for loan losses. Disposals of loans, which may include sales of loans, receipt of payments in full by the borrower, or foreclosure, result in removal of the loan from the SOP 03-3 portfolio.

With respect to purchased credit-impaired loans, when the timing and/or amounts of expected cash flows on such loans are not reasonably estimable, no interest is accreted and the loan is reported as a nonperforming loan; otherwise, if the timing and amounts of expected cash flows for purchased credit-impaired loans are reasonably estimable, then interest is accreted and the loans are reported as performing loans.

The composition of the Firm's aggregate loan portfolio at each of the dates indicated was as follows.

December 31, (in millions)	2008	2007
U.S. wholesale loans:		
Commercial and industrial	**$ 68,709**	$ 55,655
Real estate	**64,214**	16,748

(a) Includes Investment Bank, Commercial Banking, Treasury & Securities Services and Asset Management.
(b) Includes purchased credit-impaired loans of $224 million at December 31, 2008, acquired in the Washington Mutual transaction.
(c) Represents credits extended for real estate-related purposes to borrowers who are primarily in the real estate development or investment businesses and which the repayment is predominantly from the sale, lease, management, operations or refinancing of the property.
(d) Includes loans for commercial & industrial, real estate, financial institutions and other of $11.0 billion, $428 million, $1.5 billion and $995 million at December 31, 2008, respectively, and $19.6 billion, $548 million, $862 million and $2.7 billion at December 31, 2007 respectively.
(e) Includes Retail Financial Services, Card Services and the Corporate/Private Equity segment.
(f) Includes billed finance charges and fees net of an allowance for uncollectible amounts.
(g) Includes loans for prime mortgage and other (largely student loans) of $206 million and $1.8 billion at December 31, 2008, respectively, and $570 million and $3.4 billion at December 31, 2007, respectively.
(h) Loans (other than purchased loans and those for which the SFAS 159 fair value option has been elected) are presented net of unearned income and net deferred loan fees of $694 million and $1.0 billion at December 31, 2008 and 2007, respectively.

The following table reflects information about the Firm's loan sales.

Year ended December 31, (in millions)	**2008**	2007	2006
Net gains/(losses) on sales of loans (including lower of cost or fair value adjustments)[a]	**$(2,508)**	$ 99	$ 672

(a) Excludes sales related to loans accounted for at fair value.

Purchased credit-impaired loans

In connection with the Washington Mutual transaction, JPMorgan Chase acquired certain loans that it deemed to be credit-impaired under SOP 03-3. Wholesale loans with a carrying amount of $224 million at December 31, 2008, were determined to be credit-impaired at the date of acquisition in accordance with SFAS 114. These wholesale loans are being accounted for individually (not on a pooled basis) and are reported as nonperforming loans since cash flows for each individual loan are not reasonably estimable. Such loans are excluded from the remainder of the following discussion, which relates solely to purchased credit-impaired consumer loans.

Purchased credit-impaired consumer loans were determined to be credit-impaired based upon specific risk characteristics of the loan, including product type, loan-to-value ratios, FICO scores, and past due status. SOP 03-3 allows purchasers to aggregate credit-impaired loans acquired in the same fiscal quarter into one or more pools, provided that the loans have common risk characteristics. A pool is then accounted for as a single asset with a single composite interest rate and an aggregate expectation of cash flows. With respect to the Washington Mutual transaction, all of the consumer loans were aggregated into pools of loans with common risk characteristics.

The table below sets forth information about these purchased credit-impaired consumer loans at the acquisition date.

(in millions)	September 25, 2008[a][b]
Contractually required payments receivable (including interest)	$ 168,460
Less: Nonaccretable difference	(45,690)
Cash flows expected to be collected[c]	122,770
Less: Accretable yield[d]	(32,662)
Fair value of loans acquired	$ 90,108

(a) Date of the Washington Mutual transaction.
(b) The amounts in the table above were revised in the fourth quarter of 2008 due to the Firm's refinement of both estimates and its application of certain provisions of SOP 03-3.
(c) Represents undiscounted principal and interest cash flows expected at acquisition.
(d) This amount is recognized into interest income over the estimated life of the underlying loans.

The Firm determined the fair value of the purchased credit-impaired consumer loans by discounting the cash flows expected to be collected at a market observable discount rate, when available, adjusted for factors that a market participant would consider in determining fair value. In determining the cash flows expected to be collected, management incorporated assumptions regarding default rates, loss severities and the amounts and timing of prepayments. Contractually required payments were determined following the same process used to estimate cash flows expected to be collected, but without incorporating assumptions related to default rates and loss severities.

Purchased credit-impaired loans acquired in the Washington Mutual transaction are reported in loans on the Firm's Consolidated Balance Sheets. Following the initial acquisition date of these loans, the allowance for loan losses, if any is required, would be reported as a reduction of the carrying amount of the loans. No allowance has been recorded for these loans as of December 31, 2008. The outstanding balance and the carrying value of the purchased credit-impaired consumer loans were as follows.

December 31, 2008 (in millions)	
Outstanding balance[a]	$ 118,180
Carrying amount	88,813

(a) Represents the sum of principal and earned interest at the reporting date.

Interest income is being accreted on the purchased credit-impaired consumer loans based on the Firm's belief that both the timing and amount of cash flows expected to be collected is reasonably estimable. For variable rate loans, expected future cash flows are based on the current contractual rate of the underlying loans.

The table below sets forth the accretable yield activity for these loans for the year ended December 31, 2008.

Accretable Yield Activity
(in millions)

Balance, September 30, 2008	$ 32,662
Accretion into interest income	(1,292)
Changes in interest rates on variable rate loans	(4,877)
Balance, December 31, 2008	**$ 26,493**

Impaired loans

A loan is considered impaired when, based upon current information and events, it is probable that the Firm will be unable to collect all amounts due (including principal and interest) according to the contractual terms of the loan agreement. Impaired loans include certain nonaccrual wholesale loans and loans for which a charge-off has been recorded based upon the fair value of the underlying collateral. Impaired loans also include loans that have been modified in troubled debt restructurings as a concession to borrowers experiencing financial difficulties. Troubled debt restructurings typically result from the Firm's loss mitigation activities and could include rate reductions, principal forgiveness, forbearance and other actions intended to minimize the economic loss and to avoid foreclosure or repossession of collateral. When the Firm modifies home equity lines of credit in troubled debt restructurings, future lending commitments related to the modified loans are canceled as part of the terms of the modification. Accordingly, the Firm does not have future commitments to lend additional funds related to these modified loans. Purchased credit-impaired loans are not required to be reported as impaired loans as long as it is probable that the Firm expects to collect all cash flows expected at acquisition, plus additional cash flows expected to be collected arising from changes in estimates after acquisition. Accordingly, none of the credit-impaired loans acquired in the Washington Mutual transaction are reported in the following tables.

Interest income on impaired loans is recognized based on the Firm's policy for recognizing interest on accrual and nonaccrual loans. Certain loans that have been modified through troubled debt restructurings accrue interest under this policy.

The tables below set forth information about JPMorgan Chase's impaired loans, excluding credit card loans which are discussed below. The Firm primarily uses the discounted cash flow method for valuing impaired loans.

December 31, (in millions)	2008	2007
Impaired loans with an allowance:		
Wholesale	**$ 2,026**	$ 429
Consumer[a]	**2,252**	322
Total impaired loans with an allowance[b]	**4,278**	751
Impaired loans without an allowance:[c]		
Wholesale	**62**	28
Consumer[a]	**—**	—
Total impaired loans without an allowance	**62**	28
Total impaired loans[b]	**$ 4,340**	$ 779
Allowance for impaired loans under SFAS 114:		
Wholesale	**$ 712**	$ 108
Consumer[a]	**379**	116
Total allowance for impaired loans under SFAS 114[d]	**$ 1,091**	$ 224

Year ended December 31, (in millions)	2008	2007	2006
Average balance of impaired loans during the period:			
Wholesale	**$ 896**	$ 316	$ 697
Consumer[a]	**1,211**	317	300
Total impaired loans[b]	**$ 2,107**	$ 633	$ 997
Interest income recognized on impaired loans during the period:			
Wholesale	**$ —**	$ —	$ 2
Consumer[a]	**57**	—	—
Total interest income recognized on impaired loans during the period	**$ 57**	$ —	$ 2

(a) Excludes credit card loans.
(b) In 2008, methodologies for calculating impaired loans have changed. Prior periods have been revised to conform to current presentation.
(c) When the discounted cash flows, collateral value or market price equals or exceeds the carrying value of the loan, then the loan does not require an allowance under SFAS 114.
(d) The allowance for impaired loans under SFAS 114 is included in JPMorgan Chase's allowance for loan losses. The allowance for certain consumer impaired loans has been categorized in the allowance for loan losses as formula-based.

During 2008, loss mitigation efforts related to delinquent mortgage and home equity loans increased substantially, resulting in a significant increase in consumer troubled debt restructurings. In the fourth quarter of 2008, the Firm announced plans to further expand loss mitigation efforts related to these portfolios, including plans to open regional counseling centers, hire additional loan counselors, introduce new financing alternatives, proactively reach out to borrowers to offer pre-qualified modifications, and commence a new process to independently review each loan before moving it into the foreclosure process. These loss mitigation efforts, which generally represent various forms of term extensions, rate reductions and forbearances, are expected to result in additional increases in the balance of modified loans carried on the Firm's balance sheet, including loans accounted for as troubled debt restructurings, while minimizing the economic loss to the Firm and providing alternatives to foreclosure.

JPMorgan Chase may modify the terms of its credit card loan agreements with borrowers who have experienced financial difficulty. Such modifications may include canceling the customer's available line of credit on the credit card, reducing the interest rate on the card, and placing the customer on a fixed payment plan not exceeding 60 months. If the cardholder does not comply with the modified terms, then the credit card loan agreement will revert back to its original terms, with the amount of any loan outstanding reflected in the appropriate delinquency "bucket" and the loan amounts then charged-off in accordance with the Firm's standard charge-off policy. Under these procedures, $2.4 billion and $1.4 billion of on-balance sheet credit card loan outstandings have been modified at December 31, 2008 and 2007, respectively. In accordance with the Firm's methodology for determining its consumer allowance for loan losses, the Firm had already provisioned for these credit card loans; the modifications to these credit card loans had no incremental impact on the Firm's allowance for loan losses.

Note 15 – Allowance for credit losses

During 2008, in connection with the Washington Mutual transaction, the Firm recorded adjustments to its provision for credit losses in the aggregate amount of $1.5 billion to conform the Washington Mutual loan loss reserve methodologies to the appropriate JPMorgan Chase methodology, based upon the nature and characteristics of the underlying loans. This amount included an adjustment of $646 million to the wholesale provision for credit losses and an adjustment of $888 million to the consumer provision for credit losses. The Firm's methodologies for determining its allowance for credit losses, which have been applied to the Washington Mutual loans, are described more fully below.

JPMorgan Chase's allowance for loan losses covers the wholesale (risk-rated) and consumer (scored) loan portfolios and represents management's estimate of probable credit losses inherent in the Firm's loan portfolio. Management also computes an allowance for wholesale lending-related commitments using a methodology similar to that used for the wholesale loans.

The allowance for loan losses includes an asset-specific component and a formula-based component. The asset-specific component relates to provisions for losses on loans considered impaired and measured pursuant to SFAS 114. An allowance is established when the discounted cash flows (or collateral value or observable market price) of the loan is lower than the carrying value of that loan. To compute the asset-specific component of the allowance, larger impaired loans are evaluated individually, and smaller impaired loans are evaluated as a pool using historical loss experience for the respective class of assets. An allowance for loan losses will also be recorded for purchased credit-impaired loans accounted for in accordance with SOP 03-3 if there are probable decreases in expected future cash flows other than decreases related to repricing of variable rate loans. Any required allowance would be measured based on the present value of expected cash flows discounted at the loan's (or pool's) effective interest rate. For additional information on purchased credit-impaired loans, see Note 14 on pages 175–178 of this Annual Report.

The formula-based component covers performing wholesale and consumer loans. For risk-rated loans (generally loans originated by the wholesale lines of business), it is based on a statistical calculation, which is adjusted to take into consideration model imprecision, external factors and current economic events that have occurred but are not yet reflected in the factors used to derive the statistical calculation. The statistical calculation is the product of probability of default ("PD") and loss given default ("LGD"). These factors are differentiated by risk rating and expected maturity. PD estimates are based on observable external data, primarily credit-rating agency default statistics. LGD estimates are based on a study of actual credit losses over more than one credit cycle. For scored loans (generally loans originated by the consumer lines of business), loss is primarily determined by applying statistical loss factors, including loss frequency and severity factors, to pools of loans by asset type. In developing loss frequency and severity assumptions, known and anticipated changes in the economic environment, including changes in housing prices, unemployment rates and other risk indicators, are considered. Multiple forecasting methods are used to estimate statistical losses, including credit loss forecasting models and vintage-based loss forecasting.

Management applies its judgment within specified ranges to adjust the statistical calculation. Where adjustments are made to the statistical calculation for the risk-rated portfolios, the determination of the appropriate point within the range are based upon management's quantitative and qualitative assessment of the quality of underwriting standards; relevant internal factors affecting the credit quality of the current portfolio; and external factors such as current macroeconomic and political conditions that have occurred but are not yet reflected in the loss factors. Factors related to concentrated and deteriorating industries are also incorporated into the calculation, where relevant. Adjustments to the statistical calculation for the scored loan portfolios are accomplished in part by analyzing the historical loss experience for each major product segment. The specific ranges and the determination of the appropriate point within the range are based upon management's view of uncertainties that relate to current macroeconomic and political conditions, the quality of underwriting standards, and other relevant internal and external factors affecting the credit quality of the portfolio.

The allowance for lending-related commitments represents management's estimate of probable credit losses inherent in the Firm's process of extending credit. Management establishes an asset-specific allowance for lending-related commitments that are considered impaired and computes a formula-based allowance for performing wholesale lending-related commitments. These are computed using a methodology similar to that used for the wholesale loan portfolio, modified for expected maturities and probabilities of drawdown.

Determining the appropriateness of the allowance is complex and requires judgment by management about the effect of matters that are inherently uncertain. Subsequent evaluations of the loan portfolio, in light of the factors then prevailing, may result in significant changes in the allowances for loan losses and lending-related commitments in future periods.

At least quarterly, the allowance for credit losses is reviewed by the Chief Risk Officer, the Chief Financial Officer and the Controller of the Firm and discussed with the Risk Policy and Audit Committees of the Board of Directors of the Firm. As of December 31, 2008, JPMorgan Chase deemed the allowance for credit losses to be appropriate (i.e., sufficient to absorb losses that are inherent in the portfolio, including those not yet identifiable).

The table below summarizes the changes in the allowance for loan losses.

Year ended December 31, (in millions)	**2008**	2007	2006
Allowance for loan losses at January 1	**$ 9,234**	$ 7,279	$ 7,090

(b) The 2006 amount represents the Bank of New York transaction.

Note 16 – Loan securitizations

JPMorgan Chase securitizes and sells a variety of loans, including residential mortgage, credit card, automobile, student, and commercial loans (primarily related to real estate). JPMorgan Chase-sponsored securitizations utilize SPEs as part of the securitization process. These SPEs are structured to meet the definition of a QSPE (as discussed in Note 1 on page 134 of this Annual Report); accordingly, the assets and liabilities of securitization-related QSPEs are not reflected on the Firm's Consolidated Balance Sheets (except for retained interests, as described below). The primary purpose of these securitization vehicles is to meet investor needs and to generate liquidity for the Firm through the sale of loans to the QSPEs. These QSPEs are financed through the issuance of fixed, or floating-rate asset-backed securities.

The Firm records a loan securitization as a sale when the accounting criteria for a sale are met. Those criteria are: (1) the transferred assets are legally isolated from the Firm's creditors; (2) the entity can pledge or exchange the financial assets, or if the entity is a QSPE, its investors can pledge or exchange their interests; and (3) the Firm does not maintain effective control to repurchase the transferred assets before their maturity or have the ability to unilaterally cause the holder to return the transferred assets.

For loan securitizations that meet the accounting sales criteria, the gains or losses recorded depend, in part, on the carrying amount of the loans sold except for servicing assets which are initially recorded at fair value. At the time of sale, any retained servicing asset is initially recognized at fair value. The remaining carrying amount of the loans sold is allocated between the loans sold and the other interests retained, based upon their relative fair values on the date of sale. Gains on securitizations are reported in noninterest revenue.

When quoted market prices are not available, the Firm estimates the fair value for these retained interests by calculating the present value of future expected cash flows using modeling techniques. Such models incorporate management's best estimates of key variables, such as expected credit losses, prepayment speeds and the discount rates appropriate for the risks involved. See Note 4 on page 144 of this Annual Report for further information on the valuation of retained interests.

The Firm may retain interests in the securitized loans in the form of undivided seller's interest, senior or subordinated interest-only strips, debt and equity tranches, escrow accounts and servicing rights. The classification of retained interests is dependent upon several factors, including the type of interest, whether or not the retained interest is represented by a security certificate and when it was retained. Interests retained by IB are classified as trading assets. See credit card securitizations and mortgage securitizations sections of the note for further information on the classification of their related retained interests. Retained interests classified as AFS that are rated below "AA" by an external rating agency are subject to the impairment provisions of EITF 99-20, as discussed in Note 12 on page 174 of this Annual Report.

The following table presents the total unpaid principal amount of assets held in JPMorgan Chase-sponsored securitization entities, for which sale accounting was achieved and to which the Firm has continuing involvement, at December 31, 2008 and 2007. Continuing involvement includes servicing the loans, holding senior or subordinated interests, recourse or guarantee arrangements and derivative transactions. In certain instances, the Firm's only continuing involvement is servicing the loans. Certain of the Firm's retained interests (trading assets, AFS securities and other assets) are reflected at their fair value.

	Principal amount outstanding		JPMorgan Chase interest in securitized assets[f][g][h][i]				
December 31, 2008 (in billions)	Total assets held by Firm-sponsored QSPEs	Assets held in QSPEs with continuing involvement	Trading assets	AFS securities	Loans	Other assets	Total interests held by JPMorgan Chase

Total[c]	$ 307.7	$ 199.9	$ 0.7	$ 0.4	$ 18.6	$ 4.8	$ 24.5

(a) Includes Alt-A loans.
(b) Includes co-sponsored commercial securitizations and, therefore, includes non-JPMorgan Chase originated commercial mortgage loans. Commercial and other consists of securities backed by commercial loans (predominantly real estate) and non-mortgage related consumer receivables purchased from third parties. The Firm generally does not retain a residual interest in the Firm's sponsored commercial mortgage securitization transactions.
(c) Includes securitized loans where the Firm owns less than a majority of the subordinated or residual interests in the securitizations.
(d) Includes securitization-related QSPEs sponsored by heritage Bear Stearns and heritage Washington Mutual at December 31, 2008.
(e) Includes credit card loans, accrued interest and fees, and cash amounts on deposit.
(f) Excludes retained servicing (for a discussion of MSRs, see Note 18 on pages 199–200 of this Annual Report).
(g) Excludes senior and subordinated securities of $974 million at December 31, 2008, that the Firm purchased in connection with IB's secondary market-making activities.
(h) Includes investments acquired in the secondary market, but predominantly held-for-investment purposes of $1.8 billion as of December 31, 2008. This is comprised of $1.4 billion of investments classified as available-for-sale, including $172 million in credit cards, $693 million of residential mortgages and $495 million of commercial and other; and $452 million of investments classified as trading, including $112 million of credit cards, $303 million of residential mortgages, and $37 million of commercial and other.
(i) Excludes interest rate and foreign exchange derivatives that are primarily used to manage the interest rate and foreign exchange risks of the securitization entities. See Note 6 and Note 32 on pages 158–159 and 214–217, respectively, of this Annual Report for further information on derivatives.
(j) Excludes senior and subordinated securities of $9.8 billion at December 31, 2007, that were retained at the time of securitization in connection with IB's underwriting activity or that are purchased in connection with IB's secondary market-making activities.

Securitization activity by major product type

The following discussion describes the nature of the Firm's securitization activities by major product type.

Credit Card Securitizations

The Card Services ("CS") business securitizes originated and purchased credit card loans. The Firm's primary continuing involvement includes servicing the receivables, retaining an undivided seller's interest in the receivables, retaining certain senior and subordinated securities and the maintenance of escrow accounts.

CS maintains servicing responsibilities for all credit card securitizations that it sponsors. As servicer and transferor, the Firm receives contractual servicing fees based upon the securitized loan balance plus excess servicing fees, which are recorded in credit card income as discussed in Note 7 on pages 160–161 of this Annual Report.

The agreements with the credit card securitization trusts require the Firm to maintain a minimum undivided interest in the trusts (which generally ranges from 4% to 12%). At December 31, 2008 and 2007, the Firm had $33.3 billion and $18.6 billion, respectively, related to its undivided interests in the trusts. The Firm maintained an average undivided interest in principal receivables in the trusts of approximately 22% and 19% for the years ended December 31, 2008 and 2007, respectively. These undivided interests in the trusts represent the Firm's undivided interests in the receivables transferred to the trust that have not been securitized; these undivided interests are not represented by security certificates, are carried at historical cost, and are classified within loans.

Additionally, the Firm retained subordinated interest in accrued interest and fees on the securitized receivables totaling $3.0 billion and $2.7 billion (net of an allowance for uncollectible amounts) as of December 31, 2008 and 2007, respectively, which are classified in other assets.

The Firm retained subordinated securities in credit card securitization trusts totaling $2.3 billion and $284 million at December 31, 2008 and 2007, respectively, and senior securities totaling $3.5 billion at December 31, 2008. Of the securities retained, $5.4 billion and $284 million were classified as AFS securities at December 31, 2008 and 2007, respectively. Securities of $389 million that were acquired in the Washington Mutual Bank transaction were classified as trading assets at December 31, 2008. The senior AFS securities were used by the Firm as collateral for a secured financing transaction.

The Firm also maintains escrow accounts up to predetermined limits for some credit card securitizations to cover deficiencies in cash flows owed to investors. The amounts available in such escrow accounts related to credit cards are recorded in other assets and amounted to $74 million and $97 million as of December 31, 2008 and 2007, respectively.

Mortgage Securitizations

The Firm securitizes originated and purchased residential mortgages and originated commercial mortgages.

RFS securitizes residential mortgage loans that it originates and purchases and it typically retains servicing for all of its originated and purchased residential mortgage loans. Additionally, RFS may retain servicing for certain mortgage loans purchased by IB. As servicer, the Firm receives servicing fees based upon the securitized loan balance plus ancillary fees. The Firm also retains the right to service the residential mortgage loans it sells to the Government National Mortgage Association ("GNMA"), Federal National Mortgage Association ("Fannie Mae") and Federal Home Loan Mortgage Corporation ("Freddie Mac") in accordance with their servicing guidelines and standards. For a discussion of MSRs, see Note 18 on pages 199–200 of this Annual Report. In a limited number of securitizations, RFS may retain an interest in addition to servicing rights. The amount of interest retained related to these securitizations totaled $939 million and $221 million at December 31, 2008 and 2007, respectively. These retained interests are accounted for as trading or AFS securities; the classification depends on whether the retained interest is represented by a security certificate, has an embedded derivative, and when it was retained (i.e., prior to the adoption of SFAS 155).

IB securitizes residential mortgage loans (including those that it purchased and certain mortgage loans originated by RFS) and commercial mortgage loans that it originated. Upon securitization, IB may engage in underwriting and trading activities of the securities issued by the securitization trust. IB may retain unsold senior and/or subordinated interests (including residual interests) in both residential and commercial mortgage securitizations at the time of securitization. These retained interests are accounted for at fair value and classified as trading assets. The amount of residual interests retained was $155 million and $547 million at December 31, 2008 and 2007, respectively. Additionally, IB retained $2.8 billion of senior and subordinated interests as of December 31, 2008; these securities were retained at securitization in connection with the Firm's underwriting activity.

In addition to the amounts reported in the securitization activity tables below, the Firm sold residential mortgage loans totaling $122.0 billion, $81.8 billion and $53.7 billion during the years ended December 31, 2008, 2007 and 2006, respectively. The majority of these loan sales were for securitization by the GNMA, Fannie Mae and Freddie Mac. These sales resulted in pretax gains of $32 million, $47 million and $251 million, respectively.

The Firm's mortgage loan sales are primarily nonrecourse, thereby effectively transferring the risk of future credit losses to the purchaser of the loans. However, for a limited number of loan sales, the Firm is obligated to share up to 100% of the credit risk associated with the sold loans with the purchaser. See Note 33 on page 221 of this Annual Report for additional information on loans sold with recourse.

Other Securitizations

The Firm also securitizes automobile and student loans originated by RFS and purchased consumer loans (including automobile and student loans). The Firm retains servicing responsibilities for all originated and certain purchased student and automobile loans. It may also hold a retained interest in these securitizations; such residual interests are classified as other assets. At December 31, 2008 and 2007, the Firm held $37 million and $85 million, respectively, of retained interests in securitized automobile loans and $52 million and $55 million, respectively, of retained interests in securitized student loans.

The Firm also maintains escrow accounts up to predetermined limits for some automobile and student loan securitizations to cover deficiencies in cash flows owed to investors. These escrow accounts are classified within other assets and carried at fair value. The amounts available in such escrow accounts as of December 31, 2008, were $3 million for both automobile and student loan securitizations; as of December 31, 2007, these amounts were $21 million and $3 million for automobile and student loan securitizations, respectively.

Securitization activity

The following tables provide information related to the Firm's securitization activities for the years ended December 31, 2008, 2007 and 2006. For the periods presented there were no cash flows from the Firm to the QSPEs related to recourse or guarantee arrangements.

Weighted-average life (in years)	0.4	1.7-4.0	1.5-2.4		1.5-6.1		1.4-1.9
Expected credit losses	3.3-4.2%	0.1-3.3%[j]	1.1-2.1%		0.0-0.9%[j]		0.3-0.7%
Discount rate	12.0%	8.4-26.2%	15.1-22.0%		3.8-14.0%		7.6-7.8%

(a) Other cash flows received include excess servicing fees and other ancillary fees received.
(b) Includes cash paid by the Firm to reacquire assets from the QSPEs, for example, servicer clean-up calls.
(c) Excludes a random removal of $6.2 billion of credit card loans from a securitization trust previously established by Washington Mutual and an account addition of $5.8 billion of higher quality credit card loans from the legacy Chase portfolio to the legacy Washington Mutual trust in November 2008. These are noncash transactions that are permitted by the trust documents in order to maintain the appropriate level of undivided seller's interest.
(d) Includes cash flows received on retained interests including, for example, principal repayments, and interest payments.
(e) PPR: principal payment rate; CPR: constant prepayment rate; ABS: absolute prepayment speed.
(f) Includes $5.5 billion of securities retained by the Firm.
(g) Includes securitizations sponsored by Bear Stearns and Washington Mutual as of their respective acquisition dates.
(h) Includes Alt-A loans.
(i) As of January 1, 2007, the Firm adopted the fair value election for IB warehouse and the RFS prime mortgage warehouse. The carrying value of these loans accounted for at fair value approximates the proceeds received from securitization.
(j) Expected credit losses for consumer prime residential mortgage, and student and certain other securitizations are minimal and are incorporated into other assumptions.

Retained securitization interests

The following table summarizes the Firm's retained securitization interests, which are carried at fair value on the Firm's Consolidated Balance Sheets at December 31, 2008. As of December 31, 2008, 55% of the Firm's retained securitization interests, which are carried at fair value, were risk rated "A" or better.

	Ratings profile of retained interests[c][d]		
	2008		
December 31, (in billions)	Investment Grade	Noninvestment grade	Retained interest
Asset types:			
Credit card[a]	**$ 5.5**	**$ 3.8**	**$ 9.3**
Residential mortgage:			
Prime[b]	**1.1**	**0.3**	**1.4**
Subprime	**—**	**0.1**	**0.1**
Option ARMs	**0.4**	**—**	**0.4**
Commercial and other	**1.7**	**0.3**	**2.0**
Student loans	**—**	**0.1**	**0.1**
Auto	**—**	**—**	**—**
Total	**$ 8.7**	**$ 4.6**	**$ 13.3**

(a) Includes retained subordinated interests carried at fair value, including CS' accrued interests and fees, escrow accounts, and other residual interests. Excludes undivided seller interest in the trusts of $33.3 billion at December 31, 2008, which is carried at historical cost, and unencumbered cash amounts on deposit of $2.1 billion at December 31, 2008.
(b) Includes Alt-A loans.
(c) The ratings scale is presented on an S&P-equivalent basis.
(d) Excludes $1.8 billion of investments acquired in the secondary market, but predominantly held for investment purposes. Of this amount $1.7 billion is classified as investment grade.

The table below outlines the key economic assumptions used at December 31, 2008 and 2007, to determine the fair value as of December 31, 2008 and 2007, respectively, of the Firm's retained interests, other than MSRs, that are valued using modeling techniques; it excludes securities that are valued using quoted market prices. The table below also outlines the sensitivities of those fair values to immediate 10% and 20% adverse changes in assumptions used to determine fair value. For a discussion of residential MSRs, see Note 18 on pages 199–200 of this Annual Report.

		Residential mortgage					
December 31, 2008 (in millions, except rates and where otherwise noted)	Credit card	Prime[c]	Subprime	Option ARMs	Commercial and other	Student loans	Auto

Discount rates	12.0%	11.0-23.9%	15.0-30.0%	—%	1.0-18.0%	9.0%	6.8%
Impact of 10% adverse change	$ (2)	$ (18)	$ (16)	$ —	$ —	$ (3)	$ —
Impact of 20% adverse change	(4)	(36)	(31)	—	(1)	(5)	(1)

(a) PPR: principal payment rate; ABS: absolute prepayment speed; CPR: constant prepayment rate.
(b) Excludes certain interests that are not valued using modeling techniques.
(c) Includes Alt-A loans.
(d) Including the valuation assumptions used to determine the fair value for a limited amount of retained interests resulted in a wider range than those used for the majority of the portfolio. Excluding these retained interests, the range of assumptions used to value the prime/Alt A mortgage retained interests would have been 0.0-29.4% for prepayment rates; 0.0-25.0% for loss assumptions; and 9.9-21.4% for discount rates.
(e) Expected losses for prime residential mortgage, student loans and certain wholesale securitizations are minimal and are incorporated into other assumptions.
(f) Including the loss assumptions used to determine the fair value for a limited amount of retained interests resulted in a wider range than those used for the majority of the portfolio. Excluding these retained interests, the range of loss assumption used to value the subprime mortgage retained interests would have been 0.2-43.5%.
(g) The valuation assumptions used to determine the fair value for a limited amount of retained interests were higher than the majority of the portfolio. Excluding these retained interests, the range of assumptions used to value the commercial and other retained interests would have been 0.0-22.0% for prepayment rates and 3.3-30.4% for the discount rates.

The sensitivity analysis in the preceding table is hypothetical. Changes in fair value based upon a 10% or 20% variation in assumptions generally cannot be extrapolated easily because the relationship of the change in the assumptions to the change in fair value may not be linear. Also, in the table, the effect that a change in a particular assumption may have on the fair value is calculated without changing any other assumption. In reality, changes in one factor may result in changes in another, which might counteract or magnify the sensitivities. The above sensitivities also do not reflect the Firm's risk management practices that may be undertaken to mitigate such risks.

The table below includes information about delinquencies, net charge-offs and components of reported and securitized financial assets at December 31, 2008 and 2007.

December 31, (in millions)	Total Loans		90 days past due and still accruing		Nonaccrual assets[g][h]		Net loan charge-offs Year ended

Student	**1,074**	1,141	**66**	—	**—**	—	**1**	—
Commercial and other	**45,677**	3,419	**28**	—	**166**	—	**8**	11
Total loans securitized[d]	**$ 452,322**	$ 179,811	**$ 1,896**	$ 1,050	**$41,039**	$ 4,459	**$14,348**	$ 2,824
Total loans reported and securitized[e]	**$ 1,197,220**[f]	$ 699,185[f]	**$ 5,171**	$ 3,093	**$49,992**	$ 7,741	**$24,183**	$ 7,362

(a) Includes Alt-A loans.
(b) Includes loans for prime mortgage and other (largely student loans) of $206 million and $1.8 billion at December 31, 2008, respectively, and $570 million and $3.4 billion at December 31, 2007, respectively.
(c) Purchased credit-impaired loans represent loans acquired in the Washington Mutual acquisition that were considered credit-impaired under SOP 03-3, and include $6.4 billion of loans that were nonperforming immediately prior to the acquisition. Under SOP 03-3, these loans are considered to be performing loans as of the acquisition date; they accrete interest income over the estimated life of the loan when cash flows are reasonably estimable, even if the underlying loans are contractually past due. For additional information, see Note 14 on pages 175–178 of this Annual Report.
(d) Total assets held in securitization-related SPEs were $640.8 billion and $307.7 billion at December 31, 2008 and 2007, respectively. The $452.3 billion and $179.8 billion of loans securitized at December 31, 2008 and 2007, respectively, excludes $152.4 billion and $107.8 billion of securitized loans, respectively, in which the Firm has no continuing involvement; $33.3 billion and $18.6 billion of seller's interests in credit card master trusts, respectively; and $2.8 billion and $1.5 billion of cash amounts on deposit and escrow accounts.
(e) Represents both loans on the Consolidated Balance Sheets and loans that have been securitized.
(f) Includes securitized loans that were previously recorded at fair value and classified as trading assets.
(g) During the second quarter of 2008, the policy for classifying subprime mortgage and home equity loans as nonperforming was changed to conform to all other home lending products. Amounts for 2007 have been revised to reflect this change.
(h) Excludes nonperforming assets related to (i) loans eligible for repurchase, as well as loans repurchased from GNMA pools that are insured by U.S. government agencies, of $3.3 billion and $1.5 billion at December 31, 2008 and 2007, respectively, and (ii) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program, of $437 million and $417 million at December 31, 2008 and 2007, respectively. These amounts for GNMA and student loans are excluded, as reimbursement is proceeding normally.
(i) Includes nonperforming loans held-for-sale and loans at fair value of $32 million and $50 million at December 31, 2008 and 2007, respectively.

Subprime adjustable-rate mortgage loan modifications

See the Glossary of Terms on page 232 of this Annual Report for the Firm's definition of subprime loans. Within the confines of the limited decision-making abilities of a QSPE under SFAS 140, the operating documents that govern existing subprime securitizations generally authorize the servicer to modify loans for which default is reasonably foreseeable, provided that the modification is in the best interests of the QSPE's beneficial interest holders and would not result in a REMIC violation.

In December 2007, the American Securitization Forum ("ASF") issued the "Streamlined Foreclosure and Loss Avoidance Framework for Securitized Subprime Adjustable Rate Mortgage Loans" (the "Framework"). The Framework provides guidance for servicers to streamline evaluation procedures for borrowers with certain subprime adjustable rate mortgage ("ARM") loans to more efficiently provide modifications of such loans with terms that are more appropriate for the individual needs of such borrowers. The Framework applies to all first-lien subprime ARM loans that have a fixed rate of interest for an initial period of 36 months or less, are included in securitized pools, were originated between January 1, 2005, and July 31, 2007, and have an initial interest rate reset date between January 1, 2008, and July 31, 2010 ("ASF Framework Loans").

The Framework categorizes the population of ASF Framework Loans into three segments: Segment 1 includes loans where the borrower is current and is likely to be able to refinance into any readily available mortgage product; Segment 2 includes loans where the borrower is current, is unlikely to be able to refinance into any readily available mortgage industry product and meets certain defined criteria; and Segment 3 includes loans where the borrower is not current, as defined, and does not meet the criteria for Segments 1 or 2.

ASF Framework Loans in Segment 2 of the Framework are eligible for fast-track modification under which the interest rate will be kept at the existing initial rate, generally for five years following the interest rate reset date. The Framework indicates that for Segment 2 loans, JPMorgan Chase, as servicer, may presume that the borrower will be unable to make payments pursuant to the original terms of the borrower's loan after the initial interest rate reset date. Thus, the Firm may presume that a default on that loan by the borrower is reasonably foreseeable unless the terms of the loan are modified. JPMorgan Chase has adopted the loss mitigation approaches under the Framework for securitized subprime ARM loans that meet the specific Segment 2 criteria and began modifying Segment 2 loans during the first quarter of 2008. The adoption of the Framework did not affect the off-balance sheet accounting treatment of JPMorgan Chase-sponsored QSPEs that hold Segment 2 subprime loans.

The total dollar amount of assets owned by Firm-sponsored QSPEs that hold subprime adjustable rate mortgage loans as of December 31, 2008 and 2007, was $30.8 billion and $20.0 billion, respectively. Of these amounts, $12.7 billion and $9.7 billion, respectively, are related to ASF Framework Loans serviced by the Firm. Included within the assets owned by Firm-sponsored QSPEs was foreclosure-related real estate owned, for which JPMorgan Chase is the servicer, in the amount of $3.5 billion and $637 million at December 31, 2008 and 2007, respectively. The growth in real estate owned in 2008 is attributable to the Washington Mutual transaction and increased foreclosures resulting from current housing market conditions. The following table presents the principal amounts of ASF Framework Loans, serviced by the Firm, that are owned by Firm-sponsored QSPEs that fell within Segments 1, 2 and 3 as of December 31, 2008 and 2007, respectively.

December 31, (in millions, except ratios)	2008		2007	
	Amount	%	Amount	%
Segment 1	**$ 1,940**	**15%**	$ 1,940	20%
Segment 2	**2,930**	**23**	970	10
Segment 3	**7,806**	**62**	6,790	70
Total	**$ 12,676**	**100%**	$ 9,700	100%

The estimates of segment classification could change substantially in the future as a result of future changes in housing values, economic conditions, borrower/investor behavior and other factors.

The total principal amount of beneficial interests issued by the Firm-sponsored securitizations that hold ASF Framework Loans as of December 31, 2008 and 2007, was as follows.

December 31, (in millions)	2008	2007
Third-party	**$ 44,401**	$ 19,636
Retained interest	**99**	412
Total	**$ 44,500**	$ 20,048

For those ASF Framework Loans serviced by the Firm and owned by Firm-sponsored QSPEs, the Firm modified principal amounts of $1.7 billion of Segment 2 subprime mortgages during the year ended December 31, 2008. There were no Segment 2 subprime mortgages modified during the year ended December 31, 2007. For Segment 3 loans, the Firm has adopted a loss mitigation approach, without employing the fast-track modifications prescribed for Segment 2 subprime mortgages, that is intended to maximize the recoveries of the securitization trust. The loss mitigation approach chosen by JPMorgan Chase is consistent with the applicable servicing agreements and could include rate reductions, principal forgiveness, forbearance and other actions intended to minimize economic loss and avoid foreclosure. The table below presents selected information relating to the principal amount of Segment 3 loans for the year ended December 31, 2008, including those that have been modified, subjected to other loss mitigation activities or have been prepaid by the borrower.

Year ended December 31, 2008 (in millions)	
Loan modifications	$ 2,384
Other loss mitigation activities	865
Prepayments	219

The impact of loss mitigation efforts on the fair value of the Firm's retained interests in ASF Framework loans was not material at December 31, 2008.

Note 17 – Variable interest entities

Refer to Note 1 on page 134 of this Annual Report for a further description of JPMorgan Chase's policies regarding consolidation of variable interest entities.

JPMorgan Chase's principal involvement with VIEs occurs in the following business segments:

- Investment Bank: Utilizes VIEs to assist clients in accessing the financial markets in a cost-efficient manner. IB is involved with VIEs through multi-seller conduits and for investor intermediation purposes, as discussed below. IB also securitizes loans through QSPEs, to create asset-backed securities, as further discussed in Note 16 on pages 180–188 of this Annual Report.
- Asset Management ("AM"): Provides investment management services to a limited number of the Firm's funds deemed VIEs. AM earns a fixed fee based upon assets managed; the fee varies with each fund's investment objective and is competitively priced. For the limited number of funds that qualify as VIEs, AM's relationships with such funds are not considered significant variable interests under FIN 46(R).
- Treasury & Securities Services: Provides services to a number of VIEs that are similar to those provided to non-VIEs. TSS earns market-based fees for the services it provides. The relationships resulting from TSS' services are not considered to be significant variable interests under FIN 46(R).
- Commercial Banking ("CB"): Utilizes VIEs to assist clients in accessing the financial markets in a cost-efficient manner. This is often accomplished through the use of products similar to those offered in IB. CB may assist in the structuring and/or ongoing administration of these VIEs and may provide liquidity, letters of credit and/or derivative instruments in support of the VIE. The relationships resulting from CB's services are not considered to be significant variable interests under FIN 46(R).
- Corporate/Private Equity: Corporate utilizes VIEs to issue guaranteed capital debt securities. See Note 23 on page 203 for further information. The Private Equity business, also included in Corporate, may be involved with entities that could be deemed VIEs. Private equity activities are accounted for in accordance with the AICPA Audit and Accounting Guide *Investment Companies* (the "Guide"). In June 2007, the AICPA issued SOP 07-1, which provides guidance for determining whether an entity is within the scope of the Guide, and therefore qualifies to use the Guide's specialized accounting principles (referred to as "investment company accounting"). In May 2007, the FASB issued FSP FIN 46(R)-7, which amends FIN 46(R) to permanently exempt entities within the scope of the Guide from applying the provisions of FIN 46(R) to their investments. In February 2008, the FASB agreed to an indefinite delay of the effective date of SOP 07-1 in order to address implementation issues, which effectively delays FSP FIN 46(R)-7 as well for those companies, such as the Firm, that have not adopted SOP 07-1. Had FIN 46(R) been applied to VIEs subject to this deferral, the impact would have been immaterial to the Firm's consolidated financial statements as of December 31, 2008.

As noted above, IB is predominantly involved with multi-seller conduits and VIEs associated with investor intermediation activities. These nonconsolidated VIEs that are sponsored by JPMorgan Chase are discussed below. The Firm considers a "sponsored" VIE to include any entity where: (1) JPMorgan Chase is the principal beneficiary of the structure; (2) the VIE is used by JPMorgan Chase to securitize Firm assets; (3) the VIE issues financial instruments associated with the JPMorgan Chase brand name; or (4) the entity is a JPMorgan Chase administered ABCP conduit.

Multi-seller conduits

Funding and liquidity

The Firm is an active participant in the asset-backed securities business, and it helps customers meet their financing needs by providing access to the commercial paper markets through VIEs known as multi-seller conduits. Multi-seller conduit entities are separate bankruptcy-remote entities that purchase interests in, and make loans secured by, pools of receivables and other financial assets pursuant to agreements with customers of the Firm. The conduits fund their purchases and loans through the issuance of highly rated commercial paper to third-party investors. The primary source of repayment of the commercial paper is the cash flow from the pools of assets. In most instances, the assets are structured with deal-specific credit enhancements provided by the customers (i.e., sellers) to the conduits or other third parties. Deal-specific credit enhancements are generally structured to cover a multiple of historical losses expected on the pool of assets, and are typically in the form of overcollateralization provided by the seller, but also may include any combination of the following: recourse to the seller or originator, cash collateral accounts, letters of credit, excess spread, retention of subordinated interests or third-party guarantees. The deal-specific credit enhancements mitigate the Firm's potential losses on its agreements with the conduits.

JPMorgan Chase receives fees related to the structuring of multi-seller conduit transactions and compensation from the multi-seller conduits for its role as administrative agent, liquidity provider, and provider of program-wide credit enhancement.

As a means of ensuring timely repayment of the commercial paper, each asset pool financed by the conduits has a minimum 100% deal-specific liquidity facility associated with it. Deal-specific liquidity facilities are the primary source of liquidity support for the conduits. The deal-specific liquidity facilities are typically in the form of asset purchase agreements and generally structured so the liquidity that will be provided by the Firm as liquidity provider will be effected by the Firm purchasing, or lending against, a pool of nondefaulted, performing assets.

The conduit's administrative agent can require the liquidity provider to perform under its asset purchase agreement with the conduit at any time. These agreements may cause the liquidity provider, including the Firm, to purchase an asset from the conduit at an amount above the asset's then current fair value – in effect providing a guarantee of the initial value of the reference asset as of the date of the agreement. In limited circumstances, the Firm may provide unconditional liquidity.

The Firm also provides the multi-seller conduit vehicles with program-wide liquidity facilities in the form of uncommitted short-term revolving facilities that can be accessed by the conduits to handle funding increments too small to be funded by commercial paper and in the form of uncommitted liquidity facilities that can be accessed by the conduits only in the event of short-term disruptions in the commercial paper market.

Because the majority of the deal-specific liquidity facilities will only fund nondefaulted assets, program-wide credit enhancement is required to absorb losses on defaulted receivables in excess of losses absorbed by any deal-specific credit enhancement. Program-wide credit enhancement may be provided by JPMorgan Chase in the form of standby letters of credit or by third-party surety bond providers. The amount of program-wide credit enhancement required varies by conduit and ranges between 5% and 10% of applicable commercial paper outstanding.

The following table summarizes the Firm's involvement with nonconsolidated Firm-administered multi-seller conduits. There were no consolidated Firm-administered multi-seller conduits as of December 31, 2008 or 2007.

December 31, (in billions)	**2008**	2007
Total assets held by conduits	**$ 42.9**	$ 61.2
Total commercial paper issued by conduits	**43.1**	62.6
Liquidity and credit enhancements[a]		
Deal-specific liquidity facilities (primary asset purchase agreements)	**55.4**	87.3
Program-wide liquidity facilities	**17.0**	13.2
Program-wide credit enhancements	**3.0**	2.5
Maximum exposure to loss[b]	**56.9**	88.9

(a) The accounting for these agreements is further discussed in Note 33 on pages 218–222. The carrying value related to asset purchase agreements was $147 million at December 31, 2008, of which $138 million represented the remaining fair value of the guarantee under FIN 45. The Firm has recognized this guarantee in other liabilities with an offsetting entry recognized in other assets for the net present value of the future premium receivable under the contracts.

(b) The Firm's maximum exposure to loss is limited to the amount of drawn commitments (i.e., sellers' assets held by the multi-seller conduits for which the Firm provides liquidity support) of $42.9 billion and $61.2 billion at December 31, 2008 and 2007, respectively, plus contractual but undrawn commitments of $14.0 billion and $27.7 billion at December 31, 2008 and 2007, respectively. Since the Firm provides credit enhancement and liquidity to Firm-administered, multi-seller conduits, the maximum exposure is not adjusted to exclude exposure that would be absorbed by third-party liquidity providers.

Assets funded by the multi-seller conduits

JPMorgan Chase's administered multi-seller conduits fund a variety of asset types for the Firm's clients. Asset types primarily include credit card receivables, auto loans, trade receivables, student loans, commercial loans, residential mortgages, capital commitments (e.g., loans to private equity, mezzanine and real estate opportunity funds secured by capital commitments of highly rated institutional investors), and various other asset types. It is the Firm's intention that the assets funded by its administered multi-seller conduits be sourced only from the Firm's clients and not originated by, or transferred from, JPMorgan Chase.

The following table presents information on the commitments and assets held by JPMorgan Chase's administered multi-seller conduits as of December 31, 2008 and 2007.

Summary of exposure to Firm-administered nonconsolidated multi-seller conduits

	2008				2007

(a) The ratings scale is presented on an S&P equivalent basis.
(b) Weighted average expected life for each asset type is based upon the remaining term of each conduit transaction's committed liquidity plus either the expected weighted average life of the assets should the committed liquidity expire without renewal or the expected time to sell the underlying assets in the securitization market.

The assets held by the multi-seller conduits are structured so that if they were rated, the Firm believes the majority of them would receive an "A" rating or better by external rating agencies. However, it is unusual for the assets held by the conduits to be explicitly rated by an external rating agency. Instead, the Firm's Credit Risk group assigns each asset purchase liquidity facility an internal risk-rating based upon its assessment of the probability of default for the transaction. The ratings provided in the above table reflect the S&P-equivalent ratings of the internal rating grades assigned by the Firm.

The risk ratings are periodically reassessed as information becomes available. As of December 31, 2008 and 2007, 90% and 93%, respectively, of the assets in the conduits were risk-rated "A" or better.

Commercial paper issued by the multi-seller conduits

The weighted average life of commercial paper issued by the multi-seller conduits at December 31, 2008 and 2007, was 27 days and 26 days, respectively, and the average yield on the commercial paper at December 31, 2008 and 2007, was 0.6% and 5.7%, respectively.

In the normal course of business, JPMorgan Chase trades and invests in commercial paper, including paper issued by the Firm-administered conduits. The percentage of commercial paper purchased by the Firm across all Firm-administered conduits during the year ended December 31, 2008, ranged from less than 1% to approximately 20% on any given day. The largest daily amount of commercial paper outstanding held by the Firm in any one multi-seller conduit during the years ended December 31, 2008 and 2007, was approximately $2.7 billion, or 23%, for 2008, and $2.7 billion, or 16%, for 2007, of the conduit's commercial paper outstanding. On average, the Firm held approximately 3% of daily multi-seller conduit issued commercial paper outstanding during 2008. Total multi-seller conduit issued commercial paper held by the Firm at December 31, 2008 and 2007, was $360 million and $131 million, respectively.

The Firm is not obligated under any agreement (contractual or non-contractual) to purchase the commercial paper issued by JPMorgan Chase-administered conduits.

Consolidation analysis
The multi-seller conduits administered by the Firm were not consolidated at December 31, 2008 and 2007, because each conduit had issued expected loss notes ("ELNs"), the holders of which are committed to absorbing the majority of the expected loss of each respective conduit.

Implied support
The Firm did not have and continues not to have any intent to protect any ELN holders from potential losses on any of the conduits' holdings and has no plans to remove any assets from any conduit unless required to do so in its role as administrator. Should such a transfer occur, the Firm would allocate losses on such assets between itself and the ELN holders in accordance with the terms of the applicable ELN.

Expected loss modeling
In determining the primary beneficiary of the conduits the Firm uses a Monte Carlo–based model to estimate the expected losses of each of the conduits and considers the relative rights and obligations of each of the variable interest holders. The Firm's expected loss modeling treats all variable interests, other than the ELNs, as its own to determine consolidation. The variability to be considered in the modeling of expected losses is based on the design of the entity. The Firm's traditional multi-seller conduits are designed to pass credit risk, not liquidity risk, to its variable interest holders, as the assets are intended to be held in the conduit for the longer term.

Under FIN 46(R), the Firm is required to run the Monte Carlo-based expected loss model each time a reconsideration event occurs. In applying this guidance to the conduits, the following events, are considered to be reconsideration events, as they could affect the determination of the primary beneficiary of the conduits:

- New deals, including the issuance of new or additional variable interests (credit support, liquidity facilities, etc);
- Changes in usage, including the change in the level of outstanding variable interests (credit support, liquidity facilities, etc);
- Modifications of asset purchase agreements; and
- Sales of interests held by the primary beneficiary.

From an operational perspective, the Firm does not run its Monte Carlo-based expected loss model every time there is a reconsideration event due to the frequency of their occurrence. Instead, the Firm runs its expected loss model each quarter and includes a growth assumption for each conduit to ensure that a sufficient amount of ELNs exists for each conduit at any point during the quarter.

As part of its normal quarterly modeling, the Firm updates, when applicable, the inputs and assumptions used in the expected loss model. Specifically, risk ratings and loss given default assumptions are continually updated. The total amount of expected loss notes outstanding at December 31, 2008 and 2007, were $136 million and $130 million, respectively. Management has concluded that the model assumptions used were reflective of market participants' assumptions and appropriately considered the probability of changes to risk ratings and loss given defaults.

Qualitative considerations
The multi-seller conduits are primarily designed to provide an efficient means for clients to access the commercial paper market. The Firm believes the conduits effectively disperse risk among all parties and that the preponderance of the economic risk in the Firm's multi-seller conduits is not held by JPMorgan Chase.

Consolidated sensitivity analysis on capital
The table below shows the impact on the Firm's reported assets, liabilities, Tier 1 capital ratio and Tier 1 leverage ratio if the Firm were required to consolidate all of the multi-seller conduits that it administers at their current carrying value.

December 31, 2008

(in billions, except ratios)	Reported	Pro forma[a][b]
Assets	$ 2,175.1	$ 2,218.2
Liabilities	2,008.2	2,051.3
Tier 1 capital ratio	10.9%	10.9%
Tier 1 leverage ratio	6.9	6.8

(a) The table shows the impact of consolidating the assets and liabilities of the multi-seller conduits at their current carrying value; as such, there would be no income statement or capital impact at the date of consolidation. If the Firm were required to consolidate the assets and liabilities of the conduits at fair value, the Tier 1 capital ratio would be approximately 10.8%. The fair value of the assets is primarily based upon pricing for comparable transactions. The fair value of these assets could change significantly because the pricing of conduit transactions is renegotiated with the client, generally, on an annual basis and due to changes in current market conditions.
(b) Consolidation is assumed to occur on the first day of the quarter, at the quarter-end levels, in order to provide a meaningful adjustment to average assets in the denominator of the leverage ratio.

The Firm could fund purchases of assets from VIEs should it become necessary.

2007 activity
In July 2007, a reverse repurchase agreement collateralized by prime residential mortgages held by a Firm-administered multi-seller conduit was put to JPMorgan Chase under its deal-specific liquidity facility. The asset was transferred to and recorded by JPMorgan Chase at its par value based on the fair value of the collateral that supported the reverse repurchase agreement. During the fourth quarter of 2007, additional information regarding the value of the collateral, including performance statistics, resulted in the determination by the Firm that the fair value of the collateral was impaired. Impairment losses were allocated to the ELN holder (the party that absorbs the majority of the expected loss from the conduit) in accordance with the contractual provisions of the ELN note.

On October 29, 2007, certain structured CDO assets originated in the second quarter of 2007 and backed by subprime mortgages were transferred to the Firm from two Firm-administered multi-seller conduits. It became clear in October that commercial paper investors and rating agencies were becoming increasingly concerned about CDO assets backed by subprime mortgage exposures. Because of these concerns, and to ensure the continuing viability of the two conduits as financing vehicles for clients and as investment alternatives for commercial paper investors, the Firm, in its role as administrator, transferred the CDO assets out of the multi-seller conduits. The structured CDO assets were transferred to the Firm at

their par value of $1.4 billion. As of December 31, 2008 and 2007, the CDO assets were valued on the Consolidated Balance Sheets at $5 million and $291 million, respectively.

There were no other structured CDO assets backed by subprime mortgages remaining in JPMorgan Chase-administered multi-seller conduits as of December 31, 2008 and 2007.

The Firm does not consider the October 2007 transfer of the structured CDO assets from the multi-seller conduits to JPMorgan Chase to be an indicator of JPMorgan Chase's intent to provide implicit support to the ELN holders. This transfer was a one-time, isolated event, limited to a specific type of asset that is not typically funded in the Firm's administered multi-seller conduits. In addition, the Firm has no plans to permit multi-seller conduits to purchase such assets in the future.

Investor intermediation

As a financial intermediary, the Firm creates certain types of VIEs and also structures transactions, typically derivative structures, with these VIEs to meet investor needs. The Firm may also provide liquidity and other support. The risks inherent in the derivative instruments or liquidity commitments are managed similarly to other credit, market or liquidity risks to which the Firm is exposed. The principal types of VIEs for which the Firm is engaged in these structuring activities are municipal bond vehicles, credit-linked note vehicles, asset swap vehicles and collateralized debt obligation vehicles.

Municipal bond vehicles

The Firm has created a series of secondary market trusts that provide short-term investors with qualifying tax-exempt investments, and that allow investors in tax-exempt securities to finance their investments at short-term tax-exempt rates. In a typical transaction, the vehicle purchases fixed-rate longer-term highly rated municipal bonds and funds the purchase by issuing two types of securities: (1) putable floating-rate certificates and (2) inverse floating-rate residual interests ("residual interests"). The maturity of each of the putable floating-rate certificates and the residual interests is equal to the life of the vehicle, while the maturity of the underlying municipal bonds is longer. Holders of the putable floating-rate certificates may "put," or tender, the certificates if the remarketing agent cannot successfully remarket the floating-rate certificates to another investor. A liquidity facility conditionally obligates the liquidity provider to fund the purchase of the tendered floating-rate certificates. Upon termination of the vehicle, if the proceeds from the sale of the underlying municipal bonds are not sufficient to repay the liquidity facility, the liquidity provider has recourse either to excess collateralization in the vehicle or the residual interest holders for reimbursement.

The third-party holders of the residual interests in these vehicles could experience losses if the face amount of the putable floating-rate certificates exceeds the market value of the municipal bonds upon termination of the vehicle. Certain vehicles require a smaller initial investment by the residual interest holders and thus do not result in excess collateralization. For these vehicles there exists a reimbursement obligation which requires the residual interest holders to post, during the life of the vehicle, additional collateral to the vehicle on a daily basis as the market value of the municipal bonds declines.

JPMorgan Chase often serves as the sole liquidity provider and remarketing agent of the putable floating-rate certificates. As the liquidity provider, the Firm has an obligation to fund the purchase of the putable floating-rate certificates; this obligation is triggered by the failure to remarket the putable floating-rate certificates. The liquidity provider's obligation to perform is conditional and is limited by certain termination events, which include bankruptcy or failure to pay by the municipal bond issuer or credit enhancement provider, and the immediate downgrade of the municipal bond to below investment grade. A downgrade of the JPMorgan Chase Bank, N.A.'s short-term rating does not affect the Firm's obligation under the liquidity facility. However, in the event of a downgrade in the Firm's credit ratings, holders of the putable floating-rate instruments supported by those liquidity facility commitments might choose to sell their instruments, which could increase the likelihood that the liquidity commitments could be drawn. In vehicles in which third-party investors own the residual interests, in addition to the termination events, the Firm's exposure as liquidity provider is further limited by the high credit quality of the underlying municipal bonds, and the excess collateralization in the vehicle or the reimbursement agreements with the residual interest holders. In the fourth quarter of 2008, a drawdown occurred on one liquidity facility as a result of a failure to remarket putable floating-rate certificates. The Firm was required to purchase $19 million of putable floating-rate certificates. Subsequently, the municipal bond vehicle was terminated and the proceeds from the sales of the municipal bonds, together with the collateral posted by the residual interest holder, were sufficient to repay the putable floating-rate certificates. In 2007, the Firm did not experience a drawdown on the liquidity facilities.

As remarketing agent, the Firm may hold the putable floating-rate certificates. At December 31, 2008 and 2007, respectively, the Firm held $293 million and $617 million of these certificates on its Consolidated Balance Sheets. The largest amount held by the Firm at any time during 2008 and 2007 was $2.2 billion and $1.0 billion, respectively, or 11% and 5%, respectively, of the municipal bond vehicles' outstanding putable floating-rate certificates. The Firm did not have and continues not to have any intent to protect any residual interest holder from potential losses on any of the municipal bond holdings.

The long-term credit ratings of the putable floating-rate certificates are directly related to the credit ratings of the underlying municipal bonds, and to the credit rating of any insurer of the underlying municipal bond. A downgrade of a bond insurer would result in a downgrade of the insured municipal bonds, which would affect the rating of the putable floating-rate certificates. This could cause demand for these certificates by investors to decline or disappear, as putable floating-rate certificate holders typically require an "AA-" bond rating. At December 31, 2008 and 2007, 97% and 99%, respectively, of the municipal bonds held by vehicles to which the Firm served as liquidity provider were rated "AA-" or better, based upon either the rating of the underlying municipal bond itself, or the rating including any credit enhancement. At December 31, 2008 and 2007, $2.6 billion and $12.0 billion, respectively, of the bonds were

insured by monoline bond insurers. In addition, the municipal bond vehicles did not experience any bankruptcy or downgrade termination events during 2008 and 2007.

The Firm sometimes invests in the residual interests of municipal bond vehicles. For VIEs in which the Firm owns the residual interests, the Firm consolidates the VIEs.

The likelihood that the Firm would have to consolidate VIEs where the Firm does not own the residual interests and that are currently off-balance sheet is remote.

Exposure to nonconsolidated municipal bond VIEs at December 31, 2008 and 2007, including the ratings profile of the VIEs' assets, were as follows.

	2008				2007			
December 31, (in billions)	Fair value of assets held by VIEs	Liquidity facilities[d]	Excess/ (deficit)[e]	Maximum exposure	Fair value of assets held by VIEs	Liquidity facilities[d]	Excess/ (deficit)[e]	Maximum exposure
Nonconsolidated Municipal bond vehicles[a][b][c]	**$ 10.0**	**$ 6.9**	**$ 3.1**	**$ 6.9**	$ 19.2	$ 18.1	$ 1.1	$ 18.1

	Ratings profile of VIE assets[f]						
	Investment-grade				Noninvestment-grade		
December 31, (in billions)	AAA to AAA-	AA+ to AA-	A+ to A-	BBB to BBB-	BB+ and below	Fair value of assets held by VIEs	Wt. avg. expected life of assets (years)
Nonconsolidated municipal bond vehicles[a]							
2008	**$ 3.8**	**$ 5.9**	**$ 0.2**	**$ 0.1**	**$ —**	**$ 10.0**	**22.3**
2007	14.6	4.4	0.2	—	—	19.2	10.0

(a) Excluded $6.0 billion and $6.9 billion at December 31, 2008 and 2007, respectively, which were consolidated due to the Firm owning the residual interests.
(b) Certain of the municipal bond vehicles are structured to meet the definition of a QSPE (as discussed in Note 1 on page 134 of this Annual Report); accordingly, the assets and liabilities of QSPEs are not reflected in the Firm's Consolidated Balance Sheets (except for retained interests that are reported at fair value). Excluded nonconsolidated amounts of $603 million and $7.1 billion at December 31, 2008 and 2007, respectively, related to QSPE municipal bond vehicles in which the Firm owned the residual interests.
(c) The decline in balances at December 31, 2008, compared with December 31, 2007, was due to third-party residual interest holders exercising their right to terminate the municipal bond vehicles. The proceeds from the sales of municipal bonds were sufficient to repay the putable floating-rate certificates, and the Firm did not incur losses as a result of these terminations.
(d) The Firm may serve as credit enhancement provider in municipal bond vehicles in which it serves as liquidity provider. The Firm provided insurance on underlying municipal bonds in the form of letters of credit of $10 million and $103 million at December 31, 2008 and 2007, respectively.
(e) Represents the excess (deficit) of municipal bond asset fair value available to repay the liquidity facilities, if drawn.
(f) The ratings scale is based upon the Firm's internal risk ratings and presented on an S&P equivalent basis.

Credit-linked note vehicles

The Firm structures transactions with credit-linked note ("CLN") vehicles in which the VIE purchases highly rated assets, such as asset-backed securities, and enters into a credit derivative contract with the Firm to obtain exposure to a referenced credit which the VIE otherwise does not hold. The VIE then issues CLNs with maturities predominantly ranging from one to ten years in order to transfer the risk of the referenced credit to the VIE's investors. Clients and investors often prefer using a CLN vehicle since the CLNs issued by the VIE generally carry a higher credit rating than such notes would if issued directly by JPMorgan Chase. The Firm's exposure to the CLN vehicles is generally limited to its rights and obligations under the credit derivative contract with the VIE, as the Firm does not provide any additional contractual financial support to the VIE. In addition, the Firm has not historically provided any financial support to the CLN vehicles over and above its contractual obligations. Accordingly, the Firm typically does not consolidate the CLN vehicles. As a derivative counterparty in a credit-linked note structure, the Firm has a senior claim on the collateral of the VIE and reports such derivatives on its balance sheet at fair value. The collateral purchased by such VIEs is largely investment-grade, with a majority being rated "AAA". The Firm divides its credit-linked note structures broadly into two types: static and managed.

In a static credit-linked note structure, the CLNs and associated credit derivative contract either reference a single credit (e.g., a multinational corporation) or all or part of a fixed portfolio of credits. The Firm generally buys protection from the VIE under the credit derivative. As a net buyer of credit protection, the Firm pays a premium to the VIE in return for the receipt of a payment (up to the notional amount of the derivative) if one or more of the reference credits defaults, or if the losses resulting from the default of the reference credits exceed specified levels.

In a managed credit-linked note structure, the CLNs and associated credit derivative generally reference all or part of an actively managed portfolio of credits. An agreement exists between a portfolio manager and the VIE that gives the portfolio manager the ability to substitute each referenced credit in the portfolio for an alternative credit. By participating in a structure where a portfolio manager has the ability to substitute credits within pre-agreed terms, the investors who own the CLNs seek to reduce the risk that any single credit in the portfolio will default. The Firm does not act as portfolio manager; its involvement with the VIE is generally limited to being a derivative counterparty. As a net buyer of credit protection, the Firm pays a premium to the VIE in return for the receipt of a payment (up to the notional of the derivative) if one or more of the credits within the portfolio defaults, or if the losses resulting from the default of reference credits exceed specified levels.

Exposure to nonconsolidated credit-linked note VIEs at December 31, 2008 and 2007, was as follows.

	2008				2007			
December 31, (in billions)	Derivative receivables	Trading assets[c]	Total exposure[d]	Par value of collateral held by VIEs[e]	Derivative receivables	Trading assets[c]	Total exposure[d]	Par value of collateral held by VIEs[e]
Credit-linked notes[a]								
Static structure	**$ 3.6**	**$ 0.7**	**$ 4.3**	**$ 14.5**	$ 0.8	$ 0.4	$ 1.2	$ 13.5
Managed structure[b]	**7.7**	**0.3**	**8.0**	**16.6**	4.5	0.9	5.4	12.8
Total	**$11.3**	**$ 1.0**	**$12.3**	**$ 31.1**	$ 5.3	$ 1.3	$ 6.6	$ 26.3

(a) Excluded fair value of collateral of $2.1 billion and $2.5 billion at December 31, 2008 and 2007, respectively, which was consolidated as the Firm, in its role as secondary market maker, held a majority of the issued CLNs of certain vehicles.
(b) Includes synthetic collateralized debt obligation vehicles, which have similar risk characteristics to managed credit-linked note vehicles. At December 31, 2008 and 2007, trading assets included $7 million and $291 million, respectively, of transactions with subprime collateral.
(c) Trading assets principally comprise notes issued by VIEs, which from time to time are held as part of the termination of a deal or to support limited market-making.
(d) On-balance sheet exposure that includes derivative receivables and trading assets.
(e) The Firm's maximum exposure arises through the derivatives executed with the VIEs; the exposure varies over time with changes in the fair value of the derivatives. The Firm relies upon the collateral held by the VIEs to pay any amounts due under the derivatives; the vehicles are structured at inception so that the par value of the collateral is expected to be sufficient to pay amounts due under the derivative contracts.

Asset Swap Vehicles

The Firm also structures and executes transactions with asset swap vehicles on behalf of investors. In such transactions, the VIE purchases a specific asset or assets and then enters into a derivative with the Firm in order to tailor the interest rate or currency risk, or both, of the assets according to investors' requirements. Generally, the assets are held by the VIE to maturity, and the tenor of the derivatives would match the maturity of the assets. Investors typically invest in the notes issued by such VIEs in order to obtain exposure to the credit risk of the specific assets as well as exposure to foreign exchange and interest rate risk that is tailored to their specific needs; for example, an interest rate derivative may add additional interest rate exposure into the VIE in order to increase the return on the issued notes; or to convert an interest bearing asset into a zero-coupon bond.

The Firm's exposure to the asset swap vehicles is generally limited to its rights and obligations under the interest rate and/or foreign exchange derivative contracts, as the Firm does not provide any contractual financial support to the VIE. In addition, the Firm historically has not provided any financial support to the asset swap vehicles over and above its contractual obligations. Accordingly, the Firm typically does not consolidate the asset swap vehicles. As a derivative counterparty, the Firm has a senior claim on the collateral of the VIE and reports such derivatives on its balance sheet at fair value. Substantially all of the assets purchased by such VIEs are investment-grade.

Exposure to nonconsolidated asset swap VIEs at December 31, 2008 and 2007, was as follows.

	2008				2007			
December 31, (in billions)	Derivative receivables (payables)	Trading assets[a]	Total exposure[b]	Par value of collateral held by VIEs[c]	Derivative receivables (payables)	Trading assets[a]	Total exposure[b]	Par value of collateral held by VIEs[c]
Nonconsolidated Asset swap vehicles[d]	**$ (0.2)**	**$ —**	**$ (0.2)**	**$ 7.3**	$ 0.2	$ —	$ 0.2	$ 5.6

(a) Trading assets principally comprise notes issued by VIEs, which from time to time are held as part of the termination of a deal or to support limited market-making.
(b) On-balance sheet exposure that includes derivative receivables (payables) and trading assets.
(c) The Firm's maximum exposure arises through the derivatives executed with the VIEs; the exposure varies over time with changes in the fair value of the derivatives. The Firm relies upon the collateral held by the VIEs to pay any amounts due under the derivatives; the vehicles are structured at inception so that the par value of the collateral is expected to be sufficient to pay amounts due under the derivative contracts.
(d) Excluded fair value of collateral of $1.0 billion and $976 million at December 31, 2008 and 2007, respectively, which was consolidated as the Firm, in its role as secondary market maker, held a majority of the issued notes of certain vehicles.

Collateralized Debt Obligations vehicles

A CDO typically refers to a security that is collateralized by a pool of bonds, loans, equity, derivatives or other assets. The Firm's involvement with a particular CDO vehicle may take one or more of the following forms: arranger, warehouse funding provider, placement agent or underwriter, secondary market-maker for securities issued, or derivative counterparty.

Prior to the formal establishment of a CDO vehicle, there is a warehousing period where a VIE may be used to accumulate the assets which will be subsequently securitized and serve as the collateral for the securities to be issued to investors. During this warehousing period, the Firm may provide all or a portion of the financing to the VIE, for which the Firm earns interest on the amounts it finances. A third-party asset manager that will serve as the manager for the CDO vehicle uses the warehouse funding provided by the Firm to purchase the financial assets. The funding commitments generally are one year in duration. In the event that the securitization of assets does not occur within the committed financing period, the warehoused assets are generally liquidated.

Because of the varied levels of support provided by the Firm during the warehousing period, which typically averages six to nine months, each CDO warehouse VIE is assessed in accordance with FIN 46(R) to determine whether the Firm is considered the primary beneficiary that should consolidate the VIE. In general, the Firm would consolidate the warehouse VIE unless another third party, typically the asset manager, provides significant protection for potential declines in the value of the assets held by the VIE. In those cases, the third party that provides the protection to the warehouse VIE would consolidate the VIE.

Once the portfolio of warehoused assets is large enough, the VIE will issue securities where market conditions permit. The proceeds from the issuance of securities will be used to repay the warehouse financing obtained from the Firm and other counterparties. In connection with the establishment of the CDO vehicle, the Firm typically earns a fee for arranging the CDO vehicle and distributing the securities (as placement agent and/or underwriter) and does not typically own any equity tranches issued. Once the CDO vehicle closes and issues securities, the Firm has no further obligation to provide further support to the vehicle. At the time of closing, the Firm may hold unsold securities that the Firm was not able to place with third-party investors. The amount of unsold securities at December 31, 2008 and 2007, was insignificant. In addition, the Firm may on occasion hold some of the CDO vehicles' securities, including equity interests, as a secondary market-maker or as a principal investor, or it may be a derivative counterparty to the vehicles. At December 31, 2008 and 2007, these amounts were not significant.

Exposures to CDO warehouse VIEs at December 31, 2008 and 2007, were as follows.

December 31, 2008 (in billions)	Funded loans	Unfunded commitments[a]	Maximum exposure[b]
CDO warehouse VIEs			
Consolidated	**$ 0.4**	**$ —**	**$ 0.4**
Nonconsolidated	**0.4**	**0.7**	**1.1**
Total	**$ 0.8**	**$ 0.7**	**$ 1.5**

December 31, 2007 (in billions)	Funded loans	Unfunded commitments[a]	Maximum exposure[b]
CDO warehouse VIEs			
Consolidated	$ 2.4	$ 1.9	$ 4.3
Nonconsolidated	2.7	3.4	6.1
Total	$ 5.1	$ 5.3	$ 10.4

	Ratings profile of VIE assets[c]					
	Investment-grade				Noninvestment-grade	
December 31, (in billions)	AAA to AAA-	AA+ to AA-	A+ to A-	BBB to BBB-	BB+ and below	Total exposure
Nonconsolidated CDO warehouse VIEs						
2008	**$ —**	**$ —**	**$ —**	**$ —**	**$ 0.4**	**$ 0.4**
2007	—	—	—	—	2.7	2.7

(a) Typically contingent upon certain asset-quality conditions being met by asset managers.
(b) The aggregate of the fair value of loan exposure and any unfunded, contractually committed financing.
(c) The ratings scale is based upon JPMorgan Chase's internal risk ratings and presented on an S&P equivalent basis.

VIEs sponsored by third parties

Investment in a third-party credit card securitization trust

The Firm holds a note in a third-party-sponsored VIE, which is a credit card securitization trust (the "Trust"), that owns credit card receivables issued by a national retailer. The note is structured so that the principal amount can float up to 47% of the principal amount of the receivables held by the Trust not to exceed $4.2 billion. The Firm is not the primary beneficiary of the Trust and accounts for its investment as an AFS security, which is recorded at fair value. At December 31, 2008, the amortized cost of the note was $3.6 billion and the fair value was $2.6 billion. For more information on accounting for AFS securities, see Note 12 on pages 170–174 of this Annual Report.

VIE used in FRBNY transaction

In conjunction with the Bear Stearns merger, in June 2008, the FRBNY took control, through an LLC formed for this purpose, of a portfolio of $30.0 billion in assets, based upon the value of the portfolio as of March 14, 2008. The assets of the LLC were funded by a $28.85 billion term loan from the FRBNY, and a $1.15 billion subordinated loan from JPMorgan Chase. The JPMorgan Chase loan is subordinated to the FRBNY loan and will bear the first $1.15 billion of any losses of the portfolio. Any remaining assets in the portfolio after repayment of the FRBNY loan, the JPMorgan Chase loan and the expense of the LLC, will be for the account of the FRBNY.

Other VIEs sponsored by third parties

The Firm enters into transactions with VIEs structured by other parties. These transactions include, for example, acting as a derivative counterparty, liquidity provider, investor, underwriter, placement agent, trustee or custodian. These transactions are conducted at arm's length, and individual credit decisions are based upon the analysis of the specific VIE, taking into consideration the quality of the underlying assets. Where these activities do not cause JPMorgan Chase to absorb a majority of the expected losses of the VIEs or to receive a majority of the residual returns of the VIEs, JPMorgan Chase records and reports these positions on its Consolidated Balance Sheets similar to the way it would record and report positions from any other third-party transaction. These transactions are not considered significant for disclosure purposes under FIN 46(R).

Consolidated VIE assets and liabilities

The following table presents information on assets, liabilities and commitments related to VIEs that are consolidated by the Firm.

	Consolidated VIEs			
	Assets			
December 31, 2008 (in billions)	Trading debt and equity	Loans	Other[b]	Total assets[c]
VIE program type				
Municipal bond vehicles	**$ 5.9**	**$ —**	**$ 0.1**	**$ 6.0**
Credit-linked notes	**1.9**	**—**	**0.2**	**2.1**

Other	3.0	—	0.5	3.5
Total	$ 14.3	$ 4.4	$ 0.9	$ 19.6

	Liabilities		
December 31, 2008 (in billions)	Beneficial interests in VIE Assets[d]	Other[e]	Total liabilities
VIE program type			
Municipal bond vehicles	**$ 5.5**	**$ 0.4**	**$ 5.9**
Credit-linked notes	**1.3**	**0.6**	**1.9**
CDO warehouses	**—**	**—**	**—**
Student loans	**2.8**	**1.1**	**3.9**
Employee funds	**0.1**	**—**	**0.1**
Energy investments	**0.2**	**—**	**0.2**
Other	**0.7**	**1.8**	**2.5**
Total	**$ 10.6**	**$ 3.9**	**$ 14.5**

	Liabilities		
December 31, 2007 (in billions)	Beneficial interests in VIE Assets[d]	Other[e]	Total liabilities
VIE program type			
Municipal bond vehicles	$ 6.2	$ 0.6	$ 6.8
Credit-linked notes	2.3	0.5	2.8
CDO warehouses	—	—	—
Student loans	4.1	—	4.1
Employee funds	—	—	—
Energy investments	—	—	—
Other	1.4	0.5	1.9
Total	$ 14.0	$ 1.6	$ 15.6

(a) Excluded from total assets was $1.9 billion of unfunded commitments at December 31, 2007. There were no unfunded commitments at December 31, 2008.
(b) Included assets classified as resale agreements and other assets within the Consolidated Balance Sheets.
(c) Assets of each consolidated VIE included in the program types above are generally used to satisfy the liabilities to third parties. The difference between total assets and total liabilities recognized for consolidated VIEs represents the Firm's interest in the consolidated VIEs for each program type.
(d) The interest-bearing beneficial interest liabilities issued by consolidated VIEs are classified in the line item titled, "Beneficial interests issued by consolidated variable interest entities" on the Consolidated Balance Sheets. The holders of these beneficial interests do not have recourse to the general credit of JPMorgan Chase. Included in beneficial interests in VIE assets are long-term beneficial interests of $5.0 billion and $7.2 billion at December 31, 2008 and 2007, respectively. See Note 23 on page 203 of this Annual Report for the maturity profile of FIN 46 long-term beneficial interests.
(e) Included liabilities classified as other borrowed funds, long-term debt and other liabilities in the Consolidated Balance Sheets.

Note 18 – Goodwill and other intangible assets

Goodwill is not amortized. Instead, it is tested for impairment in accordance with SFAS 142 at the reporting-unit segment, which is generally one level below the six major reportable business segments (as described in Note 37 on pages 226–227 of this Annual Report); plus Private Equity (which is included in Corporate). Goodwill is tested annually (during the fourth quarter) or more often if events or circumstances, such as adverse changes in the business climate, indicate there may be impairment. Management applies significant judgment when determining the fair value of its reporting units. Imprecision in estimating the future earnings potential of the Firm's reporting units can affect their estimated fair value. In addition, if the current period of weak economic market conditions persists, then this could adversely impact the estimates management used to determine the fair value of its reporting units. Intangible assets determined to have indefinite lives are not amortized but are tested for impairment at least annually, or more frequently if events or changes in circumstances indicate that the asset might be impaired. The impairment test compares the fair value of the indefinite-lived intangible asset to its carrying amount. Other acquired intangible assets determined to have finite lives, such as core deposits and credit card relationships, are amortized over their estimated useful lives in a manner that best reflects the economic benefits of the intangible asset; impairment testing is performed periodically on these amortizing intangible assets.

Goodwill and other intangible assets consist of the following.

December 31, (in millions)	2008	2007
Goodwill	**$ 48,027**	$ 45,270
Mortgage servicing rights	**9,403**	8,632
Purchased credit card relationships	**1,649**	2,303
All other intangibles:		
Other credit card–related intangibles	**$ 743**	$ 346
Core deposit intangibles	**1,597**	2,067
Other intangibles	**1,592**	1,383
Total all other intangible assets	**$ 3,932**	$ 3,796

Goodwill

The $2.8 billion increase in goodwill from the prior year primarily resulted from the dissolution of the Chase Paymentech Solutions joint venture, the merger with Bear Stearns, the purchase of an additional equity interest in Highbridge and the tax-related purchase accounting adjustments associated with the Bank One merger, which increased goodwill attributed to IB. The decrease in goodwill attributed to TSS predominantly resulted from the sale of a previously consolidated subsidiary. For additional information see Note 2 on pages 135–140 of this Annual Report.

Goodwill was not impaired at December 31, 2008, or 2007, nor was any goodwill written off due to impairment during 2008 and 2007.

Goodwill attributed to the business segments was as follows.

December 31, (in millions)	2008	2007
Investment Bank	**$ 4,765**	$ 3,578
Retail Financial Services	**16,840**	16,848
Card Services	**13,977**	12,810
Commercial Banking	**2,870**	2,873
Treasury & Securities Services	**1,633**	1,660
Asset Management	**7,565**	7,124
Corporate/Private Equity	**377**	377
Total goodwill	**$ 48,027**	$ 45,270

Mortgage servicing rights

JPMorgan Chase recognizes as intangible assets mortgage servicing rights, which represent the right to perform specified mortgage servicing activities (predominantly with respect to residential mortgages) for others. MSRs are either purchased from third parties or retained upon sale or securitization of mortgage loans. Servicing activities include collecting principal, interest, and escrow payments from borrowers; making tax and insurance payments on behalf of borrowers; monitoring delinquencies and executing foreclosure proceedings; and accounting for and remitting principal and interest payments to the investors of the mortgage-backed securities.

As permitted by SFAS 156, the Firm elected to fair value MSRs as one class of servicing assets. The Firm defined MSRs as one class based on the availability of market inputs to measure MSR fair value and its treatment of MSRs as one aggregate pool for risk management purposes.

The Firm initially capitalizes MSRs based on the estimated fair value at the time of initial recognition. The Firm estimates the fair value of MSRs for initial capitalization and ongoing valuation using an option-adjusted spread model, which projects MSR cash flows over multiple interest rate scenarios in conjunction with the Firm's proprietary prepayment model and then discounts these cash flows at risk-adjusted rates. The model considers portfolio characteristics, contractually specified servicing fees, prepayment assumptions, delinquency rates, late charges, other ancillary revenue and costs to service, and other economic factors. The Firm reassesses and periodically adjusts the underlying inputs and assumptions used in the OAS model to reflect market conditions and assumptions that a market participant would consider in valuing the MSR asset. During 2007 and 2008, the Firm continued to refine its proprietary payment model based upon a number of market-related factors, including a downward trend in home prices, general tightening of credit underwriting standards and the associated impact on refinancing activity. The Firm compares fair value estimates and assumptions to observable market data where available and to recent market activity and actual portfolio experience.

The fair value of MSRs is sensitive to changes in interest rates, including their effect on prepayment speeds. JPMorgan Chase uses or has used combinations of derivatives and trading instruments to manage changes in the fair value of MSRs. The intent is to offset any changes in the fair value of MSRs with changes in the fair value of the related risk management instruments. MSRs decrease in value when interest rates decline. Conversely, securities (such as mortgage-backed securities), principal-only certificates and certain derivatives (when the Firm receives fixed-rate interest payments) increase in value when interest rates decline.

The following table summarizes MSR activity for the years ended December 31, 2008, 2007 and 2006.

Year ended December 31, (in millions, except where otherwise noted)	2008	2007	2006
Balance at beginning of period after valuation allowance	**$ 8,632**	$ 7,546	$ 6,452
Cumulative effect of change in accounting principle	**—**	—	230
Fair value at beginning of period	**8,632**	7,546	6,682
MSR activity			
Originations of MSRs	**3,061**	2,335	1,512
Purchase of MSRs	**6,755**[c]	798	627
Total additions	**9,816**	3,133	2,139
Change in valuation due to inputs and assumptions[a]	**(6,933)**	(516)	165
Other changes in fair value[b]	**(2,112)**	(1,531)	(1,440)
Total change in fair value of MSRs	**(9,045)**[d]	(2,047)	(1,275)
Fair value at December 31	**$ 9,403**	$ 8,632	$ 7,546
Change in unrealized gains (losses) included in income related to MSRs held at December 31	**$ (6,933)**	$ (516)	NA
Contractual service fees, late fees and other ancillary fees included in income	**$ 3,353**	$ 2,429	$ 2,038
Third-party mortgage loans serviced at December 31, (in billions)	**$ 1,185.0**	$ 614.7	$ 526.7

(a) Represents MSR asset fair value adjustments due to changes in inputs, such as interest rates and volatility, as well as updates to assumptions used in the valuation model. This caption also represents total realized and unrealized gains (losses) included in net income per the SFAS 157 disclosure for fair value measurement using significant unobservable inputs (level 3).
(b) Includes changes in the MSR value due to modeled servicing portfolio runoff (or time decay). This caption represents the impact of cash settlements per the SFAS 157 disclosure for fair value measurement using significant unobservable inputs (level 3).
(c) Includes MSRs acquired as a result of the Washington Mutual transaction (of which, $59 million related to commercial real estate) and the Bear Stearns merger. For further discussion, see Note 2 on pages 135–140 of this Annual Report.
(d) Includes $4 million related to commercial real estate.

The table below outlines the key economic assumptions used to determine the fair value of the Firm's MSRs at December 31, 2008 and 2007, respectively; and it outlines the sensitivities of those fair values to immediate 10% and 20% adverse changes in those assumptions.

Year ended December 31 (in millions, except rates)	2008	2007
Weighted-average prepayment speed assumption (CPR)	**35.21%**	12.49%
Impact on fair value of 10% adverse change	**$(1,039)**	$ (481)
Impact on fair value of 20% adverse change	**(1,970)**	(926)
Weighted-average option adjusted spread	**3.80%**	3.00%
Impact on fair value of 100 basis points adverse change	**$ (311)**	$ (311)
Impact on fair value of 200 basis points adverse change	**(606)**	(599)

CPR: Constant prepayment rate.

The sensitivity analysis in the preceding table is hypothetical and should be used with caution. Changes in fair value based upon a 10% and 20% variation in assumptions generally cannot be easily extrapolated because the relationship of the change in the assumptions to the change in fair value may not be linear. Also, in this table, the effect that a change in a particular assumption may have on the fair value is calculated without changing any other assumption. In reality, changes in one factor may result in changes in another, which might magnify or counteract the sensitivities.

Purchased credit card relationships and all other intangible assets

During 2008, purchased credit card relationships, other credit card-related intangibles and core deposit intangibles decreased $727 million, primarily as a result of amortization expense, partially offset by an increase in intangibles recognized related to the dissolution of the Chase Paymentech Solutions joint venture. Other intangibles (net of amortization) increased $209 million primarily as a result of the purchase of an additional equity interest in Highbridge as well as the acquisition of an institutional global custody portfolio.

Except for $517 million of indefinite-lived intangibles related to asset management advisory contracts, which are not amortized but are tested for impairment at least annually, the remainder of the Firm's other acquired intangible assets are subject to amortization.

The components of credit card relationships, core deposits and other intangible assets were as follows.

	2008			2007		
December 31, (in millions)	Gross amount	Accumulated amortization	Net carrying value	Gross amount	Accumulated amortization	Net carrying value
Purchased credit card relationships	**$5,765**	**$4,116**	**$ 1,649**	$ 5,794	$ 3,491	$ 2,303
All other intangibles:						
Other credit card-related intangibles	**$ 852**	**$ 109**	**$ 743**	$ 422	$ 76	$ 346
Core deposit intangibles	**4,280**	**2,683**	**1,597**	4,281	2,214	2,067
Other intangibles	**2,376**	**784**[(a)]	**1,592**	2,026	643[(a)]	1,383

(a) Includes amortization expense related to servicing assets on securitized automobile loans, which is recorded in lending & deposit-related fees, of $5 million and $9 million for the years ended December 31, 2008 and 2007, respectively.

Amortization expense

The following table presents amortization expense related to credit card relationships, core deposits and all other intangible assets.

Year ended December 31, (in millions)	**2008**	2007	2006
Purchased credit card relationships	**$ 625**	$ 710	$ 731
All other intangibles:			
Other credit card-related intangibles	**33**	11	6
Core deposit intangibles	**469**	554	568
Other intangibles	**136**	119	123[(a)]
Total amortization expense	**$1,263**	$ 1,394	$ 1,428

(a) Amortization expense related to the aforementioned selected corporate trust businesses were reported in income from discontinued operations for 2006.

Future amortization expense

The following table presents estimated future amortization expense related to credit card relationships, core deposits and all other intangible assets at December 31, 2008.

Year ended December 31, (in millions)	Purchased credit card relationships	Other credit card-related intangibles	Core deposit intangibles	All other intangible assets	**Total**
2009	$ 419	$ 93	$ 390	$ 123	$ 1,025
2010	350	98	329	106	883
2011	287	97	285	96	765
2012	249	98	239	93	679
2013	210	97	196	90	593

Note 19 – Premises and equipment

Premises and equipment, including leasehold improvements, are carried at cost less accumulated depreciation and amortization. JPMorgan Chase computes depreciation using the straight-line method over the estimated useful life of an asset. For leasehold improvements, the Firm uses the straight-line method computed over the lesser of the remaining term of the leased facility or the estimated useful life of the leased asset. JPMorgan Chase has recorded immaterial asset retirement obligations related to asbestos remediation under SFAS 143 and FIN 47 in those cases where it has sufficient information to estimate the obligations' fair value.

JPMorgan Chase capitalizes certain costs associated with the acquisition or development of internal-use software under SOP 98-1. Once the software is ready for its intended use, these costs are amortized on a straight-line basis over the software's expected useful life and reviewed for impairment on an ongoing basis.

Note 20 – Deposits

At December 31, 2008 and 2007, noninterest-bearing and interest-bearing deposits were as follows.

December 31, (in millions)	2008	2007
U.S. offices:		
Noninterest-bearing	**$ 210,899**	$129,406
Interest-bearing (included $1,849 and $1,909 at fair value at December 31, 2008 and 2007, respectively)	**511,077**	376,194
Non-U.S. offices:		
Noninterest-bearing	**7,697**	6,342
Interest-bearing (included $3,756 and $4,480 at fair value at December 31, 2008 and 2007, respectively)	**279,604**	228,786
Total	**$ 1,009,277**	$740,728

At December 31, 2008 and 2007, time deposits in denominations of $100,000 or more were as follows.

December 31, (in millions)	2008	2007
U.S.	**$ 147,493**	$134,529
Non-U.S.	**58,247**	69,171
Total	**$ 205,740**	$203,700

At December 31, 2008, the maturities of time deposits were as follows.

December 31, 2008 (in millions)	U.S.	Non-U.S.	**Total**
2009	$ 200,586	$ 77,934	$ 278,520
2010	5,388	916	6,304
2011	4,299	811	5,110
2012	4,418	429	4,847
2013	2,767	525	3,292
After 5 years	802	226	1,028
Total	$ 218,260	$ 80,841	$ 299,101

On October 3, 2008, the Emergency Economic Stabilization Act of 2008 was signed into law. The Act increased FDIC deposit insurance from $100,000 to $250,000 per depositor through December 31, 2009. In addition, on November 21, 2008, the FDIC released the Final Rule for the FDIC Temporary Liquidity Guarantee Program ("TLG Program"), which provides unlimited deposit insurance through December 31, 2009, for noninterest-bearing transaction deposit accounts at FDIC-insured participating institutions. The Firm elected to continue to participate in the TLG Program and, as a result, will be required to pay additional insurance premiums to the FDIC in an amount equal to an annualized 10-basis points on balances in nointerest-bearing transaction accounts that exceed the $250,000 FDIC deposit insurance limits, as determined on a quarterly basis.

Note 21 – Other borrowed funds

The following table details the components of other borrowed funds.

December 31, (in millions)	2008	2007
Advances from Federal Home Loan Banks[a]	**$ 70,187**	$ 450
Nonrecourse advances – FRBB[b]	**11,192**	—
Other	**51,021**[c]	28,385
Total	**$ 132,400**	$ 28,835

(a) Maturities of advances from the Federal Home Loan Banks were $47.4 billion, $18.5 billion, $2.6 billion, and $714 million in each of the 12-month periods ending December 31, 2009, 2010, 2011, and 2013, respectively, and $1.0 billion maturing after December 31, 2013. Maturities for the 12-month period ending December 31, 2012 were not material.

(b) On September 19, 2008, the Federal Reserve Board established a temporary lending facility, the AML Facility, to provide liquidity to eligible U.S. money market mutual funds ("MMMFs"). Under the AML Facility, banking organizations must use the loan proceeds to finance their purchases of eligible high-quality ABCP investments from MMMFs, which are pledged to secure nonrecourse advances from the FRBB. Participating banking organizations do not bear any credit or market risk related to the ABCP investments they hold under this facility; therefore, the ABCP investments held are not assessed any regulatory capital. The AML Facility will be in effect until October 30, 2009. The nonrecourse advances from the FRBB were elected under the fair value option and recorded in other borrowed funds; the corresponding ABCP investments were also elected under the fair value option and recorded in other assets.

(c) Includes $30.0 billion of advances from the Federal Reserve under the Federal Reserve's Term Auction Facility ("TAF"), pursuant to which the Federal Reserve auctions term funds to depository institutions that are eligible to borrow under the primary credit program. The TAF allows all eligible depository institutions to place a bid for an advance from its local Federal Reserve Bank at an interest rate set by an auction. All advances are required to be fully collateralized. The TAF is designed to improve liquidity by making it easier for sound institutions to borrow when the markets are not operating efficiently. The TAF does not have a fixed expiration date.

Note 22 – Accounts payable and other liabilities

The following table details the components of accounts payable and other liabilities at each of the dates indicated.

December 31, (in millions)	2008	2007
Accounts payable and other liabilities:		
Accounts payable	**$ 48,019**	$ 39,785
Brokerage payables[a]	**88,585**	14,612
Other liabilities	**51,374**	40,079
Total	**$ 187,978**	$ 94,476

(a) Includes payables to customers, brokers, dealers and clearing organizations, and securities fails.

Note 23 – Long-term debt

JPMorgan Chase issues long-term debt denominated in various currencies, although predominantly U.S. dollars, with both fixed and variable interest rates. The following table is a summary of long-term debt carrying values (including unamortized original issue discount, SFAS 133 valuation adjustments and fair value adjustments, where applicable) by contractual maturity as of December 31, 2008.

By remaining maturity at December 31, (in millions, except rates)		2008 Under 1 year	1–5 years	After 5 years	Total	2007 Total
Parent company						
Senior debt:[a]	Fixed rate	**$ 5,030**	**$ 47,606**[f]	**$ 27,272**	**$ 79,908**	$ 29,386
	Variable rate	**16,999**	**39,050**[g]	**9,185**	**65,234**	47,546
	Interest rates[b]	**0.20–7.63%**	**0.42–7.00%**	**1.40–7.50%**	**0.20–7.63%**	0.75–7.43%
Subordinated debt:	Fixed rate	**$ 3,732**	**$ 8,296**	**$ 16,938**	**$ 28,966**	$ 27,761

	Variable rate	**51**	**1,002**	**3,381**	**4,434**	6,508
	Interest rates	**3.51–7.75%**	**3.05–8.75%**	**3.40–9.16%**	**3.05–9.16%**	1.73–12.79%
Total FIN 46R long-term beneficial interests[e]		**$ 67**	**$ 1,488**	**$ 3,450**	**$ 5,005**	$ 7,209

(a) Included are various equity-linked or other indexed instruments. Embedded derivatives, separated from hybrid securities in accordance with SFAS 133, are reported at fair value and shown net with the host contract on the Consolidated Balance Sheets. Changes in fair value of separated derivatives are recorded in principal transactions revenue. Hybrid securities which the Firm has elected to measure at fair value are classified in the line item of the host contract on the Consolidated Balance Sheets; changes in fair value are recorded in principal transactions revenue in the Consolidated Statements of Income.

(b) The interest rates shown are the range of contractual rates in effect at year-end, including non U.S. dollar fixed- and variable-rate issuances, which excludes the effects of the associated derivative instruments used in SFAS 133 hedge accounting relationships, if applicable. The use of these derivative instruments modifies the Firm's exposure to the contractual interest rates disclosed in the table above. Including the effects of the SFAS 133 hedge accounting derivatives, the range of modified rates in effect at December 31, 2008, for total long-term debt was 0.18% to 14.21%, versus the contractual range of 0.03% to 14.21% presented in the table above. The interest rate ranges shown exclude structured notes accounted for at fair value under SFAS 155 or SFAS 159.

(c) Included $7.8 billion principal amount of U.S. dollar-denominated floating-rate mortgage bonds issued to an unaffiliated statutory trust, which in turn issued €6.0 billion in covered bonds secured by mortgage loans at December 31, 2008.

(d) Included $58.2 billion and $70.5 billion of outstanding structured notes accounted for at fair value at December 31, 2008 and 2007, respectively.

(e) Included on the Consolidated Balance Sheets in beneficial interests issued by consolidated VIEs. Also included $1.7 billion and $3.0 billion of outstanding structured notes accounted for at fair value at December 31, 2008 and 2007, respectively.

(f) Included $14.1 billion as of December 31, 2008, guaranteed under the TLG Program whereby newly issued senior, unsecured debt is guaranteed by the FDIC, which is discussed below.

(g) Included $6.9 billion as of December 31, 2008, guaranteed by the FDIC under the TLG Program, which is discussed below.

(h) At December 31, 2008, long-term debt aggregating $7.4 billion was redeemable at the option of JPMorgan Chase, in whole or in part, prior to maturity, based upon the terms specified in the respective notes.

(i) The aggregate principal amount of debt that matures in each of the five years subsequent to 2008 is $36.0 billion in 2009, $38.5 billion in 2010, $39.7 billion in 2011, $32.7 billion in 2012 and $18.6 billion in 2013.

(j) Included $3.4 billion and $4.6 billion of outstanding zero-coupon notes at December 31, 2008 and 2007, respectively. The aggregate principal amount of these notes at their respective maturities was $7.1 billion and $7.7 billion, respectively.

The weighted-average contractual interest rate for total long-term debt was 4.06% and 5.20% as of December 31, 2008 and 2007, respectively. In order to modify exposure to interest rate and currency exchange rate movements, JPMorgan Chase utilizes derivative instruments, primarily interest rate and cross-currency interest rate swaps, in conjunction with some of its debt issues. The use of these instruments modifies the Firm's interest expense on the associated debt. The modified weighted-average interest rate for total long-term debt, including the effects of related derivative instruments, was 3.53% and 5.13% as of December 31, 2008 and 2007, respectively.

JPMorgan Chase has elected to continue to participate in the TLG Program, which is available to, among others, all U.S. depository institutions insured by the FDIC and all U.S. bank holding companies, unless they have opted out of the TLG Program or the FDIC has terminated their participation. Under the TLG Program, the FDIC guarantees certain senior unsecured debt of JPMorgan Chase through the earlier of maturity and June 30, 2012, and in return for the guarantees, the FDIC is paid a fee based on the amount and maturity of the debt.

Under the TLG Program, the FDIC will pay the unpaid principal and interest on an FDIC-guaranteed debt instrument upon the uncured failure of the participating entity to make a timely payment of principal or interest in accordance with the terms of the instrument. The guarantee of new obligations under the TLG Program is scheduled to expire in October 2009.

JPMorgan Chase & Co. (Parent Company) has guaranteed certain debt of its subsidiaries, including both long-term debt and structured notes sold as part of the Firm's market-making activities. These guarantees rank on a parity with all of the Firm's other unsecured and unsubordinated indebtedness. Guaranteed liabilities totaled $4.8 billion and $4.7 billion at December 31, 2008 and 2007, respectively. For additional information, see Note 2 on pages 135–140 of this Annual Report.

Junior subordinated deferrable interest debentures held by trusts that issued guaranteed capital debt securities

At December 31, 2008, the Firm had established 24 wholly-owned Delaware statutory business trusts ("issuer trusts") that had issued guaranteed capital debt securities.

The junior subordinated deferrable interest debentures issued by the Firm to the issuer trusts, totaling $18.6 billion and $15.1 billion at December 31, 2008 and 2007, respectively, were reflected in the Firm's Consolidated Balance Sheets in the liabilities section under the caption "Junior subordinated deferrable interest debentures held by trusts that issued guaranteed capital debt securities" (i.e., trust preferred capital debt securities). The Firm also records the common capital securities issued by the issuer trusts in other assets in its Consolidated Balance Sheets at December 31, 2008 and 2007.

The debentures issued to the issuer trusts by the Firm, less the common capital securities of the issuer trusts, qualify as Tier 1 capital.

The following is a summary of the outstanding trust preferred capital debt securities, including unamortized original issue discount, issued by each trust, and the junior subordinated deferrable interest debenture issued to each trust as of December 31, 2008.

December 31, 2008 (in millions)	Amount of capital debt securities issued by trust[a]	Principal amount of debenture issued to trust[b]	Issue date	Stated maturity of capital securities and debentures	Earliest redemption date	Interest rate of capital securities and debentures	Interest payment/ distribution dates

Total	$16,989	$18,589					

(a) Represents the amount of capital securities issued to the public by each trust, including unamortized original issue discount.
(b) Represents the principal amount of JPMorgan Chase debentures issued to each trust, including unamortized original issue discount. The principal amount of debentures issued to the trusts includes the impact of hedging and purchase accounting fair value adjustments that were recorded on the Firm's Consolidated Financial Statements.
(c) Subject to Series K Preferred Stock restrictions, which are discussed in Note 24 below.

Note 24 – Preferred stock

JPMorgan Chase is authorized to issue 200 million shares of preferred stock, in one or more series, with a par value of $1 per share.

On April 23, 2008, the Firm issued 600,000 shares of Fixed to Floating Rate Noncumulative Perpetual Preferred Stock, Series I ("Series I").

On July 15, 2008, each series of Bear Stearns preferred stock then issued and outstanding was exchanged into a series of JPMorgan Chase preferred stock (Cumulative Preferred Stock, Series E, Series F and Series G) having substantially identical terms. As a result of the exchange, these preferred shares rank equally with the other series of the Firm's preferred stock.

On August 21, 2008, the Firm issued 180,000 shares of 8.625% Noncumulative Perpetual Preferred Stock, Series J ("Series J").

On October 28, 2008, pursuant to the U.S. Department of the Treasury's (the "U.S. Treasury") Capital Purchase Program (the "Capital Purchase Program"), the Firm issued to the U.S. Treasury, in exchange for total proceeds of $25.0 billion, (i) 2.5 million shares of the Firm's Fixed Rate Cumulative Perpetual Preferred Stock, Series K, par value $1 per share and liquidation preference $10,000 per share (the "Series K Preferred Stock"), and (ii) a warrant to purchase 88,401,697 shares of the Firm's common stock at an exercise price of $42.42 per share (the "Warrant"). The $25.0 billion proceeds were allocated to the Series K Preferred Stock and the Warrant based on the relative fair value of the instruments. The difference between the initial carrying value of $23.7 billion that was allocated to the Series K Preferred Stock and its redemption value of $25.0 billion will be charged to retained earnings (with a corresponding increase in the carrying value of the Series K Preferred Stock) over the first five years of the contract as an adjustment to the dividend yield using the effective yield method. The Series K Preferred Stock is nonvoting, qualifies as Tier 1 capital and ranks equally with the Firm's other series of preferred stock.

In the event of a liquidation or dissolution of the Firm, JPMorgan Chase's preferred stock then outstanding takes precedence over the Firm's common stock for the payment of dividends and the distribution of assets.

Generally, dividends on shares of outstanding series of preferred stock are payable quarterly. Dividends on the shares of Series I preferred stock are payable semiannually at a fixed annual dividend rate of 7.90% through April 2018, and then become payable quarterly at an annual dividend rate of three-month LIBOR plus 3.47%. Dividends are payable quarterly on the Series K Preferred Stock at a fixed annual dividend rate of 5% for the first five years, and a fixed annual dividend rate of 9% thereafter. The effective dividend yield of Series K Preferred stock is 6.16%.

The following is a summary of JPMorgan Chase preferred stock outstanding as of December 31, 2008. There was no preferred stock outstanding at December 31, 2007.

	Share value and redemption price per share[b]	Shares	Outstanding at December 31, 2008 (in millions)	Earliest redemption date	Contractual rate in effect at December 31, 2008
Cumulative Preferred Stock, Series E[a]	$ 200	818,113	$ 164	Any time[d]	6.15%
Cumulative Preferred Stock, Series F[a]	200	428,825	86	Any time[d]	5.72
Cumulative Preferred Stock, Series G[a]	200	511,169	102	Any time[d]	5.49
Fixed to Floating Rate Noncumulative Perpetual Preferred Stock, Series I[a]	10,000	600,000	6,000	4/30/2018	7.90
Noncumulative Perpetual Preferred Stock, Series J[a]	10,000	180,000	1,800	9/1/2013	8.63
Fixed Rate Cumulative Perpetual Preferred Stock, Series K	10,000	2,500,000	23,787[c]	12/1/2011[e]	5.00
Total preferred stock		5,038,107	$ 31,939		

(a) Represented by depositary shares.
(b) Redemption price includes amount shown in the table plus any accrued but unpaid dividends.
(c) Represents the carrying value as of December 31, 2008. The redemption value is $25.0 billion.
(d) Subject to Series K Preferred Stock restrictions, which are discussed below.
(e) Generally, the Firm may not redeem Series K Preferred Stock prior to the first dividend payment date falling on or after October 28, 2011. However, prior to this date, the Firm may redeem the securities up to the amount of the aggregate gross proceeds from a "qualified equity offering" if it has received aggregate gross proceeds from such offerings above an amount agreed with the U.S. Treasury and received approval from the applicable federal banking agencies.

Series K Preferred Stock

Dividend restrictions

For as long as any shares of Series K Preferred Stock are outstanding, no dividends may be declared or paid on stock ranking junior or equally with the Series K Preferred Stock, unless all accrued and unpaid dividends for all past dividend periods on the Series K Preferred Stock are fully paid. Pursuant to the Capital Purchase Program, until October 28, 2011, the U.S. Treasury's consent is required for any increase in dividends on the Firm's common stock from the amount of the last quarterly stock dividend declared by the Firm prior to October 14, 2008, unless the Series K Preferred Stock is redeemed in whole before then, or the U.S. Treasury has transferred all of the Series K Preferred Stock it owns to third parties.

Stock repurchase restrictions

The Firm may not repurchase or redeem any common stock or other equity securities of the Firm, or any trust preferred capital debt securities issued by the Firm or any of its affiliates, without the prior consent of the U.S. Treasury (other than (i) repurchases of the Series K Preferred Stock and (ii) repurchases of junior preferred shares or common stock in connection with any employee benefit plan in the ordinary course of business consistent with past practice) until October 28, 2011, unless the Series K Preferred Stock is redeemed in whole before then, or the U.S. Treasury has transferred all of the Series K Preferred Stock it owns to third parties.

Note 25 – Common stock

At December 31, 2008, JPMorgan Chase was authorized to issue 9.0 billion shares of common stock with a $1 par value per share.

On September 30, 2008, the Firm issued $11.5 billion of new shares of common stock at $40.50 per share, representing 284 million shares.

On April 8, 2008, pursuant to the Share Exchange Agreement dated March 24, 2008, between JPMorgan Chase and Bear Stearns, 20.7 million newly issued shares of JPMorgan Chase common stock were issued to Bear Stearns in a transaction that was exempt from registration under the Securities Act of 1933, pursuant to Section 4(2) thereof, in exchange for 95.0 million newly issued shares of Bear Stearns common stock (or 39.5% of Bear Stearns common stock after giving effect to the issuance). Upon the consummation of the Bear Stearns merger, on May 30, 2008, the 20.7 million shares of JPMorgan Chase common stock and 95.0 million shares of Bear Stearns common stock were cancelled. For a further discussion of this transaction, see Note 2 on pages 135–140 of this Annual Report.

Common shares issued (newly issued or distributed from treasury) by JPMorgan Chase during 2008, 2007 and 2006 were as follows.

December 31, (in millions)	**2008**	2007	2006
Issued – balance at January 1	**3,657.7**	3,657.8	3,618.2

Total treasury – balance at December 31	**(208.8)**	(290.3)	(196.1)
Outstanding	**3,732.8**	3,367.4	3,461.7

(a) Participants in the Firm's stock-based incentive plans may have shares withheld to cover income taxes. The shares withheld amounted to 0.5 million, 2.7 million and 8.1 million for 2008, 2007 and 2006, respectively.

Pursuant to the Capital Purchase Program, the Firm issued to the U.S. Treasury a Warrant to purchase up to 88,401,697 shares of the Firm's common stock at an exercise price of $42.42 per share. Based upon its fair value relative to the Series K Preferred Stock as discussed in Note 24 on pages 205–206 of this Annual Report, the Warrant was recorded in capital surplus at a value of $1.3 billion and is accounted for as equity. The Warrant is exercisable, in whole or in part, at any time and from time to time until the tenth anniversary of the issue date.

During the year ended December 31, 2008, the Firm did not repurchase any shares of common stock. During 2007 and 2006, the Firm repurchased 168 million shares and 91 million shares, respectively, of common stock under stock repurchase programs approved by the Board of Directors.

The Board of Directors approved in April 2007, a stock repurchase program that authorizes the repurchase of up to $10.0 billion of the Firm's common shares, which superseded an $8.0 billion stock repurchase program approved in 2006. The $10.0 billion authorization includes shares to be repurchased to offset issuances under the Firm's employee stock-based plans. The actual number of shares that may be repurchased is subject to various factors, including market conditions; legal considerations affecting the amount and timing of repurchase activity; the Firm's capital position (taking into account goodwill and intangibles); internal capital generation; and alternative potential investment opportunities. The repurchase program does not include specific price targets or timetables; may be executed through open market purchases or privately negotiated transactions, or utilizing Rule 10b5-1 programs; and may be suspended at any time. A Rule 10b5-1 repurchase plan allows the Firm to repurchase shares during periods when it would not otherwise be repurchasing common stock – for example, during internal trading "black-out periods." All purchases under a Rule 10b5-1 plan must be made according to a predefined plan that is established when the Firm is not aware of material nonpublic information.

For a discussion of restrictions on the Firm's ability to repurchase the Firm's common stock, see Note 24 above.

As of December 31, 2008, approximately 524 million unissued shares of common stock were reserved for issuance under various employee incentive, compensation, option and stock purchase plans, director compensation plans and the Warrant issued to the U.S. Treasury under the Capital Purchase Program as discussed above.

Note 26 – Earnings per share

SFAS 128 requires the presentation of basic and diluted earnings per share ("EPS") in the Consolidated Statements of Income. Basic EPS is computed by dividing net income applicable to common stock by the weighted-average number of common shares outstanding for the period. Diluted EPS is computed using the same method for the numerator as basic EPS but, in the denominator, the number of common shares reflect, in addition to outstanding shares, the potential dilution that could occur if convertible securities or other contracts to issue common stock were converted or exercised into common stock. Net income available for common stock is the same for basic EPS and diluted EPS, as JPMorgan Chase had no convertible securities, and therefore, no adjustments to net income applicable to common stock were necessary. The following table presents the calculation of basic and diluted EPS for 2008, 2007 and 2006.

Year ended December 31, (in millions, except per share amounts)	2008	2007	2006
Basic earnings per share			
Income from continuing operations	**$ 3,699**	$ 15,365	$ 13,649
Income from discontinued operations	**—**	—	795
Income before extraordinary gain	**$ 3,699**	$ 15,365	$ 14,444
Extraordinary gain	**1,906**	—	—
Net income	**5,605**	15,365	14,444
Less: preferred stock dividends	**674**	—	4
Net income applicable to common stock	**$ 4,931**	$ 15,365	$ 14,440
Weighted-average basic shares outstanding	**3,501**	3,404	3,470
Income from continuing operations per share	**$ 0.86**	$ 4.51	$ 3.93
Discontinued operations per share	**—**	—	0.23
Extraordinary gain per share	**0.55**	—	—
Net income per share	**$ 1.41**	$ 4.51	$ 4.16

Year ended December 31, (in millions, except per share amounts)	2008	2007	2006
Diluted earnings per share			
Net income applicable to common stock	**$ 4,931**	$ 15,365	$ 14,440
Weighted-average basic shares outstanding	**3,501**	3,404	3,470
Add: Employee restricted stock, RSUs, stock options and SARs	**104**	104	104
Weighted-average diluted shares outstanding[a]	**3,605**	3,508	3,574
Income from continuing operations per share	**$ 0.84**	$ 4.38	$ 3.82
Discontinued operations per share	**—**	—	0.22
Extraordinary gain per share	**0.53**	—	—
Net income per share	**$ 1.37**	$ 4.38	$ 4.04

(a) Options issued under employee benefit plans and, in 2008, the warrant issued under the U.S. Treasury's Capital Purchase Program to purchase an aggregate 209 million, 129 million and 150 million shares of common stock were outstanding for the years ended December 31, 2008, 2007 and 2006, respectively, but were not included in the computation of diluted EPS, because the options and warrant were antidilutive.

Note 27 – Accumulated other comprehensive income (loss)

Accumulated other comprehensive income (loss) includes the after-tax change in unrealized gains and losses on AFS securities, SFAS 52 foreign currency translation adjustments (including the impact of related derivatives), SFAS 133 cash flow hedging activities and SFAS 158 net loss and prior service cost (credit) related to the Firm's defined benefit pension and OPEB plans.

(in millions)	Unrealized gains (losses) on AFS securities[a]	Translation adjustments, net of hedges	Cash flow hedges	Net loss and prior service costs (credit) of defined benefit pension and OPEB plans[e]	Accumulated other comprehensive income (loss)
Balance at December 31, 2005	$ (224)	$ (8)	$ (394)	$ —	$ (626)
Net change	253[b]	13	(95)	—	171
Adjustment to initially apply SFAS 158, net of taxes	—	—	—	(1,102)	(1,102)
Balance at December 31, 2006	29	5	(489)	(1,102)	(1,557)
Cumulative effect of changes in accounting principles (SFAS 159)	(1)	—	—	—	(1)
Balance at January 1, 2007, adjusted	28	5	(489)	(1,102)	(1,558)
Net change	352[c]	3	(313)	599	641
Balance at December 31, 2007	380	8	(802)	(503)	(917)
Net change	**(2,481)**[d]	**(606)**	**600**	**(2,283)**	**(4,770)**
Balance at December 31, 2008	**$ (2,101)**	**$ (598)**	**$ (202)**	**$ (2,786)**	**$ (5,687)**

(a) Represents the after-tax difference between the fair value and amortized cost of the AFS securities portfolio and retained interests in securitizations recorded in other assets.
(b) The net change during 2006 was due primarily to the reversal of unrealized losses from securities sales.
(c) The net change during 2007 was due primarily to a decline in interest rates.
(d) The net change during 2008 was due primarily to spread widening in credit card asset-backed securities, non-agency mortgage-backed securities and collateralized loan obligations.
(e) For further discussion of SFAS 158, see Note 9 on pages 161–167 of this Annual Report.

The following table presents the after-tax changes in net unrealized gains (losses); and reclassification adjustments for realized (gains) losses on AFS securities and cash flow hedges; changes resulting from foreign currency translation adjustments (including the impact of related derivatives); net gains (losses) and prior service costs from pension and OPEB plans; and amortization of pension and OPEB amounts into net income. The table also reflects the adjustment to accumulated other comprehensive income (loss) resulting from the initial application of SFAS 158 to the Firm's defined benefit pension and OPEB plans. Reclassification adjustments include amounts recognized in net income that had been recorded previously in other comprehensive income (loss).

	2008			2007			2006		
Year ended December 31, (in millions)	Before tax	Tax effect	After tax	Before tax	Tax effect	After tax	Before tax	Tax effect	After tax
Unrealized gains (losses) on AFS securities:									
Net unrealized gains (losses) arising during the period	**$ (3,071)**	**$ 1,171**	**$ (1,900)**	$ 759	$ (310)	$ 449	$ (403)	$ 144	$ (259)

(a) For further discussion of SFAS 158 and details of changes to accumulated other comprehensive income (loss), see Note 9 on pages 161–167 of this Annual Report.

Note 28 – Income taxes

JPMorgan Chase and eligible subsidiaries file a consolidated U.S. federal income tax return. JPMorgan Chase uses the asset-and-liability method required by SFAS 109 as amended by FIN 48 to provide income taxes on all transactions recorded in the consolidated financial statements. This method requires that income taxes reflect the expected future tax consequences of temporary differences between the carrying amounts of assets or liabilities for book and tax purposes. Accordingly, a deferred tax liability or asset for each temporary difference is determined based upon the tax rates that the Firm expects to be in effect when the underlying items of income and expense are realized. JPMorgan Chase's expense for income taxes includes the current and deferred portions of that expense. A valuation allowance is established to reduce deferred tax assets to the amount the Firm expects to realize.

Due to the inherent complexities arising from the nature of the Firm's businesses, and from conducting business and being taxed in a substantial number of jurisdictions, significant judgments and estimates are required to be made. Agreement of tax liabilities between JPMorgan Chase and the many tax jurisdictions in which the Firm files tax returns may not be finalized for several years. Thus, the Firm's final tax-related assets and liabilities may ultimately be different than those currently reported.

The components of income tax expense (benefit) included in the Consolidated Statements of Income were as follows.

Year ended December 31, (in millions)	**2008**	2007	2006
Current income tax expense			
U.S. federal	**$ 395**	$ 2,805	$ 5,512
Non-U.S.	**1,009**	2,985	1,656
U.S. state and local	**307**	343	879
Total current income tax expense	**1,711**	6,133	8,047
Deferred income tax expense (benefit)			
U.S. federal	**(3,015)**	1,122	(1,628)
Non-U.S.	**1**	(185)	194
U.S. state and local	**377**	370	(376)
Total deferred income tax expense (benefit)	**(2,637)**	1,307	(1,810)
Total income tax expense (benefit) from continuing operations	**(926)**	7,440	6,237
Total income tax expense from discontinued operations	**—**	—	572
Total income tax expense (benefit)	**$ (926)**	$ 7,440	$ 6,809

Total income tax expense includes $55 million, $74 million, and $367 million of tax benefits recorded in 2008, 2007 and 2006, respectively, as a result of tax audit resolutions.

The preceding table does not reflect the tax effect of certain items that are recorded each period directly in stockholders' equity and certain tax benefits associated with the Firm's employee stock-based compensation plans. The table does not reflect the cumulative tax effects of initially implementing new accounting pronouncements in 2007 and 2006. The tax effect of all items recorded directly to stockholders' equity was an increase in stockholders' equity of $3.0 billion, $159 million and $885 million in 2008, 2007 and 2006, respectively.

U.S. federal income taxes have not been provided on the undistributed earnings of certain non-U.S. subsidiaries, to the extent that such earnings have been reinvested abroad for an indefinite period of time. During 2008, as part of JPMorgan Chase's periodic review of the business requirements and capital needs of its non-U.S. subsidiaries, combined with the formation of specific strategies and steps taken to fulfill these requirements and needs, the Firm determined that the undistributed earnings of certain of its subsidiaries, for which U.S. federal income taxes had been provided, will remain indefinitely reinvested to fund the current and future growth of the related businesses. As management does not intend to use the earnings of these subsidiaries as a source of funding for its U.S. operations, such earnings will not be distributed to the U.S. in the foreseeable future. This determination resulted in the release of deferred tax liabilities and the recognition of an income tax benefit of $1.1 billion associated with these undistributed earnings. For 2008, pretax earnings of approximately $2.5 billion were generated that will remain indefinitely invested in these subsidiaries. At December 31, 2008, the cumulative amount of undistributed pretax earnings in these subsidiaries approximated $12.9 billion. If the Firm were to record a deferred tax liability associated with these undistributed earnings, the amount would be $2.9 billion at December 31, 2008.

The tax expense (benefit) applicable to securities gains and losses for the years 2008, 2007 and 2006 was $608 million, $60 million and $(219) million, respectively.

A reconciliation of the applicable statutory U.S. income tax rate to the effective tax rate for continuing operations for the past three years is shown in the following table.

Year ended December 31,	**2008**	2007	2006
Statutory U.S. federal tax rate	**35.0%**	35.0%	35.0%
Increase (decrease) in tax rate resulting from:			
U.S. state and local income taxes, net of federal income tax benefit	**16.0**	2.0	2.1
Tax-exempt income	**(14.8)**	(2.4)	(2.2)
Non-U.S. subsidiary earnings	**(53.6)**	(1.1)	(0.5)
Business tax credits	**(24.5)**	(2.5)	(2.5)
Bear Stearns equity losses	**5.7**	—	—
Other, net	**2.8**	1.6	(0.5)
Effective tax rate	**(33.4)%**	32.6%	31.4%

Deferred income tax expense (benefit) results from differences between assets and liabilities measured for financial reporting and for income-tax return purposes. The significant components of deferred tax assets and liabilities are reflected in the following table.

December 31, (in millions)	2008	2007
Deferred tax assets		
Allowance for loan losses	**$ 8,029**	$ 3,800
Employee benefits	**4,841**	3,391
Allowance for other than loan losses	**3,686**	3,635
Fair value adjustments	**2,565**	—
Non-U.S. operations	**2,504**	285
Tax attribute carryforwards	**1,383**	—
Gross deferred tax assets	**$23,008**	$11,111
Deferred tax liabilities		
Depreciation and amortization	**$ 4,681**	$ 2,966
Leasing transactions	**1,895**	2,304
Fee income	**1,015**	548
Non-U.S. operations	**946**	1,790
Fair value adjustments	**—**	570
Other, net	**202**	207
Gross deferred tax liabilities	**$ 8,739**	$ 8,385
Valuation allowance	**1,266**	220
Net deferred tax asset	**$13,003**	$ 2,506

JPMorgan Chase has recorded deferred tax assets of $1.4 billion in connection with net operating loss and business tax credit carry forwards. The U.S. federal net operating loss carryforward of approximately $1.3 billion, the state and local net operating loss carryforwards of approximately $7.2 billion, and the business tax credit carryforward of approximately $300 million are subject to annual limitations on utilization. If not utilized, the net operating losses would expire in 2026, 2027 and 2028, and the business tax credits would expire in 2028. In addition, an alternative minimum tax credit carryforward has been recorded for approximately $200 million and has an indefinite carryforward period.

A valuation allowance has been recorded relating to state and local net operating losses, losses associated with non-U.S. subsidiaries and losses associated with certain portfolio investments. The increase in the valuation allowance from the prior year to 2008 is largely related to Bear Stearns.

The Firm adopted and applied FIN 48, which addresses the recognition and measurement of tax positions taken or expected to be taken, and also provides guidance on derecognition, classification, interest and penalties, accounting in interim periods and disclosure, to all of its income tax positions at the required effective date of January 1, 2007, resulting in a $436 million cumulative effect increase to retained earnings, a reduction in goodwill of $113 million and a $549 million decrease in the liability for income taxes.

At December 31, 2008 and 2007, JPMorgan Chase's unrecognized tax benefits, excluding related interest expense and penalties, were $5.9 billion and $4.8 billion, respectively, of which $2.9 billion and $1.3 billion, if recognized, would reduce the annual effective tax rate. As JPMorgan Chase is presently under audit by a number of tax authorities, it is reasonably possible that unrecognized tax benefits could significantly change over the next 12 months, which could also significantly impact JPMorgan Chase's quarterly and annual effective tax rates.

The following table presents a reconciliation of the beginning and ending amount of unrecognized tax benefits for the years 2008 and 2007.

Unrecognized tax benefits

Year ended December 31, (in millions)	2008	2007
Balance at January 1,	**$4,811**	$ 4,677
Increases based on tax positions related to the current period	**890**	434
Decreases based on tax positions related to the current period	**(109)**	(241)
Increases associated with the Bear Stearns merger	**1,387**	—
Increases based on tax positions related to prior periods	**501**	903
Decreases based on tax positions related to prior periods	**(1,386)**	(791)
Decreases related to settlements with taxing authorities	**(181)**	(158)
Decreases related to a lapse of applicable statute of limitations	**(19)**	(13)
Balance at December 31,	**$5,894**	$ 4,811

Pretax interest expense and penalties related to income tax liabilities recognized in income tax expense were $571 million ($346 million after-tax) in 2008 and $516 million ($314 million after-tax) in 2007. Included in accounts payable and other liabilities at December 31, 2008 and 2007, in addition to the Firm's liability for unrecognized tax benefits, was $2.3 billion and $1.6 billion, respectively, for income tax-related interest and penalties, of which the penalty component was insignificant.

JPMorgan Chase is subject to ongoing tax examinations by the tax authorities of the various jurisdictions in which it operates, including U.S. federal and state and non-U.S. jurisdictions. The Firm's consolidated federal income tax returns are presently under examination by the Internal Revenue Service ("IRS") for the years 2003, 2004 and 2005. The consolidated federal income tax returns of Bank One Corporation, which merged with and into JPMorgan Chase on July 1, 2004, are under examination for the years 2000 through 2003, and for the period January 1, 2004, through July 1, 2004. The consolidated federal income tax returns of Bear Stearns for the years ended November 30, 2003, 2004 and 2005, are also under examination. All three examinations are expected to conclude in 2009. The IRS audits of the consolidated federal income tax returns of JPMorgan Chase for the years 2006 and 2007, and for Bear Stearns for the years ended November 30, 2006 and 2007, are expected to commence in 2009. Administrative appeals are pending with the IRS relating to prior examination periods. For 2002 and prior years, refund claims relating to income and credit adjustments, and to tax attribute carrybacks, for JPMorgan Chase and its predecessor entities, including Bank One, have been filed. Amended returns to reflect refund claims primarily attributable to net operating losses and tax credit carrybacks will be filed for the final Bear Stearns federal consolidated tax return for the period December 1, 2007, through May 30, 2008, and for prior years.

The following table presents the U.S. and non-U.S. components of income from continuing operations before income tax expense (benefit).

Year ended December 31, (in millions)	**2008**	2007	2006
U.S.	**$ (2,094)**	$ 13,720	$12,934
Non-U.S.[(a)]	**4,867**	9,085	6,952
Income from continuing operations before income tax expense (benefit)	**$ 2,773**	$ 22,805	$19,886

(a) For purposes of this table, non-U.S. income is defined as income generated from operations located outside the U.S.

Note 29 – Restrictions on cash and intercompany funds transfers

The business of JPMorgan Chase Bank, National Association ("JPMorgan Chase Bank, N.A.") is subject to examination and regulation by the Office of the Comptroller of the Currency ("OCC"). The Bank is a member of the U.S. Federal Reserve System, and its deposits are insured by the FDIC as discussed in Note 20 on page 202 of this Annual Report.

The Board of Governors of the Federal Reserve System (the "Federal Reserve") requires depository institutions to maintain cash reserves with a Federal Reserve Bank. The average amount of reserve balances deposited by the Firm's bank subsidiaries with various Federal Reserve Banks was approximately $1.6 billion in 2008 and 2007.

Restrictions imposed by U.S. federal law prohibit JPMorgan Chase and certain of its affiliates from borrowing from banking subsidiaries unless the loans are secured in specified amounts. Such secured loans to the Firm or to other affiliates are generally limited to 10% of the banking subsidiary's total capital, as determined by the risk-based capital guidelines; the aggregate amount of all such loans is limited to 20% of the banking subsidiary's total capital.

The principal sources of JPMorgan Chase's income (on a parent company–only basis) are dividends and interest from JPMorgan Chase Bank, N.A., and the other banking and nonbanking subsidiaries of JPMorgan Chase. In addition to dividend restrictions set forth in statutes and regulations, the Federal Reserve, the OCC and the FDIC have authority under the Financial Institutions Supervisory Act to prohibit or to limit the payment of dividends by the banking organizations they supervise, including JPMorgan Chase and its subsidiaries that are banks or bank holding companies, if, in the banking regulator's opinion, payment of a dividend would constitute an unsafe or unsound practice in light of the financial condition of the banking organization.

At January 1, 2009 and 2008, JPMorgan Chase's banking subsidiaries could pay, in the aggregate, $17.0 billion and $16.2 billion, respectively, in dividends to their respective bank holding companies without the prior approval of their relevant banking regulators. The capacity to pay dividends in 2009 will be supplemented by the banking subsidiaries' earnings during the year.

In compliance with rules and regulations established by U.S. and non-U.S. regulators, as of December 31, 2008 and 2007, cash in the amount of $20.8 billion and $16.0 billion, respectively, and securities with a fair value of $12.1 billion and $3.4 billion, respectively, were segregated in special bank accounts for the benefit of securities and futures brokerage customers.

Note 30 – Capital

The Federal Reserve establishes capital requirements, including well-capitalized standards for the consolidated financial holding company. The OCC establishes similar capital requirements and standards for the Firm's national banks, including JPMorgan Chase Bank, N.A., and Chase Bank USA, N.A.

There are two categories of risk-based capital: Tier 1 capital and Tier 2 capital. Tier 1 capital includes common stockholders' equity, qualifying preferred stock and minority interest less goodwill and other adjustments. Tier 2 capital consists of preferred stock not qualifying as Tier 1, subordinated long-term debt and other instruments qualifying as Tier 2, and the aggregate allowance for credit losses up to a certain percentage of risk-weighted assets. Total regulatory capital is subject to deductions for investments in certain subsidiaries. Under the risk-based capital guidelines of the Federal Reserve, JPMorgan Chase is required to maintain minimum ratios of Tier 1 and Total (Tier 1 plus Tier 2) capital to risk-weighted assets, as well as minimum leverage ratios (which are defined as Tier 1 capital to average adjusted on-balance sheet assets). Failure to meet these minimum requirements could cause the Federal Reserve to take action. Banking subsidiaries also are subject to these capital requirements by their respective primary regulators. As of December 31, 2008 and 2007, JPMorgan Chase and all of its banking subsidiaries were well-capitalized and met all capital requirements to which each was subject.

The Federal Reserve granted the Firm, for a period of 18 months following the Bear Stearns merger, relief up to a certain specified amount and subject to certain conditions from the Federal Reserve's risk-based capital and leverage requirements with respect to Bear Stearns' risk-weighted assets and other exposures acquired. The amount of such relief is subject to reduction by one-sixth each quarter subsequent to the merger and expires on October 1, 2009. The OCC granted JPMorgan Chase Bank, N.A. similar relief from its risk-based capital and leverage requirements.

The following table presents the risk-based capital ratios for JPMorgan Chase and its significant banking subsidiaries at December 31, 2008 and 2007.

(in millions, except ratios)	Tier 1 capital	Total capital	Risk-weighted assets[c]	Adjusted average assets[d]	Tier 1 capital ratio	Total capital ratio	Tier 1 leverage ratio
December 31, 2008[a]							
JPMorgan Chase & Co.	**$136,104**	**$ 184,720**	**$ 1,244,659**	**$ 1,966,895**	**10.9%**	**14.8%**	**6.9%**
JPMorgan Chase Bank, N.A.	**100,594**	**143,854**	**1,153,039**	**1,705,750**	**8.7**	**12.5**	**5.9**
Chase Bank USA, N.A.	**11,190**	**12,901**	**101,472**	**87,286**	**11.0**	**12.7**	**12.8**
December 31, 2007[a]							
JPMorgan Chase & Co.	$ 88,746	$ 132,242	$ 1,051,879	$ 1,473,541	8.4%	12.6%	6.0%
JPMorgan Chase Bank, N.A.	78,453	112,253	950,001	1,268,304	8.3	11.8	6.2
Chase Bank USA, N.A.	9,407	10,720	73,169	60,905	12.9	14.7	15.5
Well-capitalized ratios[b]					6.0%	10.0%	5.0%[e]
Minimum capital ratios[b]					4.0	8.0	3.0[f]

(a) Asset and capital amounts for JPMorgan Chase's banking subsidiaries reflect intercompany transactions, whereas the respective amounts for JPMorgan Chase reflect the elimination of intercompany transactions.
(b) As defined by the regulations issued by the Federal Reserve, OCC and FDIC.
(c) Includes off-balance sheet risk-weighted assets in the amounts of $357.5 billion, $332.2 billion and $18.6 billion, respectively, at December 31, 2008, and $352.7 billion, $336.8 billion and $13.4 billion, respectively, at December 31, 2007, for JPMorgan Chase, JPMorgan Bank, N.A. and Chase Bank USA, N.A.
(d) Adjusted average assets, for purposes of calculating the leverage ratio, include total average assets adjusted for unrealized gains/losses on securities, less deductions for disallowed goodwill and other intangible assets, investments in certain subsidiaries and the total adjusted carrying value of nonfinancial equity investments that are subject to deductions from Tier 1 capital.
(e) Represents requirements for banking subsidiaries pursuant to regulations issued under the Federal Deposit Insurance Corporation Improvement Act. There is no Tier 1 leverage component in the definition of a well-capitalized bank holding company.
(f) The minimum Tier 1 leverage ratio for bank holding companies and banks is 3% or 4% depending on factors specified in regulations issued by the Federal Reserve and OCC.

Note: Rating agencies allow measures of capital to be adjusted upward for deferred tax liabilities which have resulted from both nontaxable business combinations and from tax-deductible goodwill. The Firm had deferred tax liabilities resulting from nontaxable business combinations totaling $1.1 billion at December 31, 2008, and $2.0 billion at December 31, 2007. Additionally, the Firm had deferred tax liabilities resulting from tax-deductible goodwill of $1.6 billion at December 31, 2008, and $939 million at December 31, 2007.

The following table shows the components of the Firm's Tier 1 and Total capital.

December 31, (in millions)	2008	2007
Tier 1 capital		
Total stockholders' equity	**$166,884**	$123,221
Effect of certain items in accumulated other comprehensive income (loss) excluded from Tier 1 capital	**5,084**	925
Adjusted stockholders' equity	**171,968**	124,146
Minority interest[a]	**17,257**	15,005
Less: Goodwill	**48,027**	45,270
SFAS 157 DVA	**2,358**	882
Investments in certain subsidiaries	**679**	782
Nonqualifying intangible assets	**2,057**	3,471
Tier 1 capital	**136,104**	88,746
Tier 2 capital		
Long-term debt and other instruments qualifying as Tier 2	**31,659**	32,817
Qualifying allowance for credit losses	**17,187**	10,084
Adjustment for investments in certain subsidiaries and other	**(230)**	595
Tier 2 capital	**48,616**	43,496
Total qualifying capital	**$184,720**	$132,242

(a) Primarily includes trust preferred capital debt securities of certain business trusts.

Note 31 – Commitments and contingencies

At December 31, 2008, JPMorgan Chase and its subsidiaries were obligated under a number of noncancelable operating leases for premises and equipment used primarily for banking purposes, and for energy-related tolling service agreements. Certain leases contain renewal options or escalation clauses providing for increased rental payments based upon maintenance, utility and tax increases or require the Firm to perform restoration work on leased premises. No lease agreement imposes restrictions on the Firm's ability to pay dividends, engage in debt or equity financing transactions or enter into further lease agreements.

The following table presents required future minimum rental payments under operating leases with noncancelable lease terms that expire after December 31, 2008.

Year ended December 31, (in millions)	
2009	$ 1,676
2010	1,672
2011	1,543
2012	1,456
2013	1,387
After 2013	9,134
Total minimum payments required[a]	16,868
Less: Sublease rentals under noncancelable subleases	(2,266)
Net minimum payment required	$ 14,602

(a) Lease restoration obligations are accrued in accordance with SFAS 13, and are not reported as a required minimum lease payment.

Total rental expense was as follows.

Year ended December 31, (in millions)	2008	2007	2006
Gross rental expense	**$1,917**	$1,380	$1,266
Sublease rental income	**(415)**	(175)	(194)
Net rental expense	**$1,502**	$1,205	$1,072

At December 31, 2008, assets were pledged to secure public deposits and for other purposes. The significant components of the assets pledged were as follows.

December 31, (in billions)	2008	2007
Reverse repurchase/securities borrowing agreements	**$ 456.6**	$ 333.7
Securities	**31.0**	4.5
Loans	**342.3**	160.4
Trading assets and other	**98.0**	102.2
Total assets pledged[a]	**$ 927.9**	$ 600.8

(a) Total assets pledged do not include assets of consolidated VIEs. These assets are generally used to satisfy liabilities to third parties. See Note 17 on pages 189–198 of this Annual Report for additional information on assets and liabilities of consolidated VIEs.

The Firm has resolved with the IRS issues related to compliance with reporting and withholding requirements for certain accounts transferred to The Bank of New York Mellon Corporation ("BNYM") in connection with the Firm's sale to BNYM of its corporate trust business. The resolution of these issues did not have a material effect on the Firm.

Note 32 – Accounting for derivative instruments and hedging activities

Derivative instruments enable end-users to increase, reduce or alter exposure to credit or market risks. The value of a derivative is derived from its reference to an underlying variable or combination of variables such as equity, foreign exchange, credit, commodity or interest rate prices or indices. JPMorgan Chase makes markets in derivatives for customers and also is an end-user of derivatives in order to hedge or manage risks of market exposures, modify the interest rate characteristics of related balance sheet instruments or meet longer-term investment objectives. The majority of the Firm's derivatives are entered into for market-making purposes. SFAS 133, as amended by SFAS 138, SFAS 149, SFAS 155 and FSP FAS 133-1, establishes accounting and reporting standards for derivative instruments, including those used for trading and hedging activities and derivative instruments embedded in other contracts. All free-standing derivatives are required to be recorded on the Consolidated Balance Sheets at fair value. The accounting for changes in value of a derivative depends on whether or not the contract has been designated and qualifies for hedge accounting. Derivative receivables and payables, whether designated for hedging relationships or not, are recorded in trading assets and trading liabilities as set forth in Note 6 on page 159 of this Annual Report.

Derivatives used for trading purposes

The Firm makes markets in derivatives for customers seeking to modify, or reduce interest rate, credit, foreign exchange, equity and commodity and other market risks or for risk-taking purposes. The Firm typically manages its exposure from such derivatives by entering into derivatives or other financial instruments that partially or fully offset the exposure from the client transaction. The Firm actively manages any residual exposure and seeks to earn a spread between the client derivatives and offsetting positions. For the Firm's own account, the Firm uses derivatives to take risk positions or to benefit from differences in prices between derivative markets and markets for other financial instruments.

Derivatives used for risk management purposes

Interest rate contracts, which are generally interest rate swaps, forwards and futures are utilized in the Firm's risk management activities to minimize fluctuations in earnings caused by interest rate volatility. As a result of interest rate fluctuations, fixed-rate assets and liabilities appreciate or depreciate in market value. Gains or losses on the derivative instruments that are linked to fixed-rate assets and liabilities and forecasted transactions are expected to offset substantially this unrealized appreciation or depreciation. Interest income and interest expense on variable-rate assets and liabilities and on forecasted transactions increase or decrease as a result of interest rate fluctuations. Gains and losses on the derivative instruments that are linked to assets and liabilities and forecasted transactions are expected to offset substantially this variability in earnings. Interest rate swaps involve the exchange of fixed-rate and variable-rate interest payments based on the contracted notional amount. Forward contracts used for the Firm's interest rate risk management activities are primarily arrangements to exchange cash in the future based on price movements of specified financial instruments. Futures contracts used are primarily index futures which provide for cash payments based upon the movements of an underlying rate index.

The Firm uses foreign currency contracts to manage the foreign exchange risk associated with certain foreign currency-denominated (i.e., non-U.S.) assets and liabilities and forecasted transactions denominated in a foreign currency, as well as the Firm's equity investments in foreign subsidiaries. As a result of foreign currency fluctuations, the U.S. dollar equivalent values of the foreign currency-denominated assets and liabilities or forecasted transactions change. Gains or losses on the derivative instruments that are linked to the foreign currency denominated assets or liabilities or forecasted transactions are expected to offset substantially this variability. Foreign exchange forward contracts represent agreements to exchange the currency of one country for the currency of another country at an agreed-upon price on an agreed-upon settlement date.

The Firm uses forward contracts to manage the overall price risk associated with the gold inventory in its commodities portfolio. As a result of gold price fluctuations, the fair value of the gold inventory changes. Gains or losses on the derivative instruments that are linked to gold inventory are expected to substantially offset this unrealized appreciation or depreciation. Forward contracts used for the Firm's gold inventory risk management activities are arrangements to deliver gold in the future.

The Firm uses credit derivatives to manage the credit risk associated with loans, lending-related commitments and derivative receivables, as well as exposure to residential and commercial mortgages. Credit derivatives compensate the purchaser when the entity referenced in the contract experiences a credit event such as bankruptcy or a failure to pay an obligation when due. For a further discussion of credit derivatives, see the discussion below.

In order to qualify for hedge accounting, a derivative must be considered highly effective at reducing the risk associated with the exposure being hedged. In order for a derivative to be designated as a hedge, there must be documentation of the risk management objective and strategy, including identification of the hedging instrument, the hedged item and the risk exposure, and how effectiveness is to be assessed prospectively and retrospectively. To assess effectiveness, the Firm uses statistical methods such as regression analysis, as well as nonstatistical methods including dollar value comparisons of the change in the fair value of the derivative to the change in the fair value or cash flows of the hedged item. The extent to which a hedging instrument has been and is expected to continue to be effective at achieving offsetting changes in fair value or cash flows must be assessed and documented at least quarterly. Any ineffectiveness must be reported in current-period earnings. If it is determined that a derivative is not highly effective at hedging the designated exposure, hedge accounting is discontinued.

For qualifying fair value hedges, all changes in the fair value of the derivative and in the fair value of the hedged item for the risk being hedged are recognized in earnings. If the hedge relationship is terminated, then the fair value adjustment to the hedged item continues

to be reported as part of the basis of the item and continues to be amortized to earnings as a yield adjustment. For qualifying cash flow hedges, the effective portion of the change in the fair value of the derivative is recorded in other comprehensive income (loss) and recognized in the Consolidated Statements of Income when the hedged cash flows affect earnings. The ineffective portions of cash flow hedges are immediately recognized in earnings. If the hedge relationship is terminated, then the change in fair value of the derivative recorded in accumulated other comprehensive income (loss) is recognized when the cash flows that were hedged occur, consistent with the original hedge strategy. For hedge relationships that are discontinued because the forecasted transaction is not expected to occur according to the original strategy, any related derivative amounts recorded in accumulated other comprehensive income (loss) are immediately recognized in earnings. For qualifying net investment hedges, changes in the fair value of the derivative or the revaluation of the foreign currency–denominated debt instrument are recorded in the translation adjustments account within accumulated other comprehensive income (loss).

JPMorgan Chase's fair value hedges primarily include hedges of the interest rate risk inherent in fixed-rate long-term debt, warehouse loans, AFS securities, and the overall price of gold inventory. All changes in the hedging derivative's fair value are included in earnings consistent with the classification of the hedged item, primarily net interest income for long-term debt and AFS securities; other income for warehouse loans; and principal transactions revenue for gold inventory. The Firm did not recognize any gains or losses during 2008, 2007 or 2006 on firm commitments that no longer qualified as fair value hedges.

JPMorgan Chase also enters into derivative contracts to hedge exposure to variability in cash flows from floating-rate financial instruments and forecasted transactions, primarily the rollover of short-term assets and liabilities, and foreign currency–denominated revenue and expense. All hedging derivative amounts affecting earnings are recognized consistent with the classification of the hedged item, primarily net interest income.

The Firm uses forward foreign exchange contracts and foreign currency–denominated debt instruments to protect the value of net investments in subsidiaries whose functional currency is not the U.S. dollar. The portion of the hedging derivative excluded from the assessment of hedge effectiveness (i.e., forward points) is recorded in net interest income.

JPMorgan Chase does not seek to apply hedge accounting to all of the Firm's economic hedges. For example, the Firm does not apply hedge accounting to purchased credit default swaps used to manage the credit risk of loans and commitments because of the difficulties in qualifying such contracts as hedges under SFAS 133. Similarly, the Firm does not apply hedge accounting to certain interest rate derivatives used as economic hedges.

The following table presents derivative instrument hedging-related activities for the periods indicated.

Year ended December 31, (in millions)	**2008**	2007	2006
Fair value hedge ineffective net gains[a]	**$ 434**	$ 111	$ 51
Cash flow hedge ineffective net gains[a]	**18**	29	2
Cash flow hedging net gains on forecasted transactions that failed to occur	**—**	15[b]	—

(a) Includes ineffectiveness and the components of hedging instruments that have been excluded from the assessment of hedge effectiveness.
(b) During the second half of 2007, the Firm did not issue short-term fixed rate Canadian dollar denominated notes due to the weak credit market for Canadian short-term debt.

Over the next 12 months, it is expected that $348 million (after-tax) of net losses recorded in accumulated other comprehensive income (loss) at December 31, 2008, will be recognized in earnings. The maximum length of time over which forecasted transactions are hedged is ten years, and such transactions primarily relate to core lending and borrowing activities.

Credit derivatives

Credit derivatives are financial instruments whose value is derived from the credit risk associated with the debt of a third party issuer (the reference entity) and which allow one party (the protection purchaser) to transfer that risk to another party (the protection seller). Credit derivatives expose the protection purchaser to the creditworthiness of the protection seller, as the protection seller is required to make payments under the contract when the reference entity experiences a credit event, such as a bankruptcy, failure to pay its obligation, or a restructuring. The seller of credit protection receives a premium for providing protection, but has the risk that the underlying instrument referenced in the contract will be subjected to a credit event.

The Firm is both a purchaser and seller of credit protection in the credit derivatives market and uses credit derivatives for two primary purposes. First, in its capacity as a market-maker in the dealer/client business, the Firm actively risk manages a portfolio of credit derivatives by purchasing and selling credit protection, predominantly on corporate debt obligations, to meet the needs of customers. As a seller of protection, the Firm's exposure to a given reference entity may be offset partially, or entirely, with a contract to purchase protection from another counterparty on the same or similar reference entity. Second, the Firm uses credit derivatives in order to mitigate the Firm's credit risk associated with the overall derivative receivables and traditional commercial credit lending exposures (loans and unfunded commitments) as well as to manage its exposure to residential and commercial mortgages. See Note 4 on pages 141–155 of this Annual Report for further information on the Firm's mortgage-related exposures. In accomplishing the above, the Firm uses different types of credit derivatives. Following is a summary of various types of credit derivatives.

Credit default swaps

Credit derivatives may reference the credit of either a single reference entity ("single-name") or a broad-based index, as described further below. The Firm purchases and sells protection on both single-name and index-reference obligations. Single-name credit default swaps ("CDS") and index CDS contracts are both OTC derivative contracts. Single-name CDS are used to manage the default risk of a single reference entity, while CDS index are used to manage credit risk associated with the broader credit markets or credit market segments. Like the S&P 500 and other market indices, a CDS index is comprised of a portfolio of CDS across many reference entities. New series of CDS indices are established approximately every six months with a new underlying portfolio of reference entities to reflect changes in the credit markets. If one of the reference entities in the index experiences a credit event, then the reference entity that defaulted is removed from the index and is replaced with another reference entity. CDS can also be referenced against specific portfolios of reference names or against customized exposure levels based on specific client demands: for example, to provide protection against the first $1 million of realized credit losses in a $10 million portfolio of exposure. Such structures are commonly known as tranche CDS.

For both single-name CDS contracts and index CDS, upon the occurrence of a credit event, under the terms of a CDS contract neither party to the CDS contract has recourse to the reference entity. The protection purchaser has recourse to the protection seller for the difference between the face value of the CDS contract and the fair value of the reference obligation at the time of settling the credit derivative contract, also known as the recovery value. The protection purchaser does not need to hold the debt instrument of the underlying reference entity in order to receive amounts due under the CDS contract when a credit event occurs.

Credit-linked notes

A credit linked note ("CLN") is a funded credit derivative where the issuer of the CLN purchases credit protection on a referenced entity from the note investor. Under the contract, the investor pays the issuer par value of the note at the inception of the transaction, and in return, the issuer pays periodic payments to the investor, based on the credit risk of the referenced entity. The issuer also repays the investor the par value of the note at maturity unless the reference entity experiences a specified credit event. In that event, the issuer is not obligated to repay the par value of the note, but rather, the issuer pays the investor the difference between the par value of the note and the fair value of the defaulted reference obligation at the time of settlement. Neither party to the CLN has recourse to the defaulting reference entity. For a further discussion of CLNs, see Note 17 on pages 194–195 of this Annual Report.

The following table presents a summary of the notional amounts of credit derivatives and credit-linked notes the Firm sold and purchased, and the net position as of December 31, 2008. Upon a credit event, the Firm as seller of protection would typically pay out only a percentage of the full notional of net protection sold; as the amount that is actually required to be paid on the contracts take into account the recovery value of the reference obligation at the time of settlement. The Firm manages the credit risk on contracts to sell protection by purchasing protection with identical or similar underlying reference entities; as such other protection purchased referenced in the following table includes credit derivatives bought on related, but not identical reference positions, including indices, portfolio coverage and other reference points, which further mitigates the risk associated with the net protection sold.

Total credit derivatives and credit-linked notes

	Maximum payout/Notional amount			
December 31, 2008 (in millions)	Protection sold	Protection purchased with identical underlyings[b]	Net protection (sold)/purchased[c]	Other protection purchased[d]
Credit derivatives				
Credit default swaps	$ (4,194,707)	$ 3,876,890	$ (317,817)	$ 302,160
Other credit derivatives[a]	(4,026)	—	(4,026)	10,096
Total credit derivatives	(4,198,733)	3,876,890	(321,843)	312,256
Credit-linked notes	(1,263)	141	(1,122)	1,792
Total	$ (4,199,996)	$ 3,877,031	$ (322,965)	$ 314,048

(a) Primarily consists of total return swaps and options to enter into credit default swap contracts.
(b) Represents the notional amount of purchased credit derivatives where the underlying reference instrument is identical to the reference instrument on which the Firm has sold credit protection.
(c) Does not take into account the fair value of the reference obligation at the time of settlement, which would generally reduce the amount the seller of protection pays to the buyer of protection in determining settlement value.
(d) Represents single-name and index CDS protection the Firm purchased primarily to risk manage the net protection sold.

The following table summarizes the notional and fair value amounts of credit derivatives and credit-linked notes as of December 31, 2008, where JPMorgan Chase is the seller of protection. The maturity profile presents the years to maturity based upon the remaining contractual maturity of the credit derivative contracts. The ratings profile is based on the rating of the reference entity on which the credit derivative contract is based. The ratings and maturity profile of protection purchased is comparable to the profile reflected below.

Protection sold – credit derivatives and credit-linked notes ratings/maturity profile[a]

December 31, 2008 (in millions)	< 1 year	1-5 years	> 5 years	Total notional amount	Fair value[c]
Risk rating of reference entity					
Investment grade (AAA to BBB-)[b]	$ (177,404)	$ (1,767,004)	$ (713,555)	$ (2,657,963)	$ (215,217)
Noninvestment grade (BB+ and below)[b]	(121,040)	(992,098)	(428,895)	(1,542,033)	(244,975)
Total	$ (298,444)	$ (2,759,102)	$ (1,142,450)	$ (4,199,996)	$ (460,192)

(a) The contractual maturity for single-name CDS contract generally ranges from three months to ten years and the contractual maturity for index CDS is generally five years. The contractual maturity for CLNs typically ranges from three to five years.
(b) Ratings scale is based upon the Firm's internal ratings, which generally correspond to ratings defined by S&P and Moody's.
(c) Amounts are shown on a gross basis, before the benefit of legally enforceable master netting agreements and cash collateral held by the Firm.

Note 33 – Off-balance sheet lending-related financial instruments and guarantees

JPMorgan Chase utilizes lending-related financial instruments (e.g., commitments and guarantees) to meet the financing needs of its customers. The contractual amount of these financial instruments represents the maximum possible credit risk should the counterparties draw down on these commitments or the Firm fulfills its obligation under these guarantees, and the counterparties subsequently fail to perform according to the terms of these contracts. Most of these commitments and guarantees expire without a default occurring or without being drawn. As a result, the total contractual amount of these instruments is not, in the Firm's view, representative of its actual future credit exposure or funding requirements. Further, certain commitments, predominantly related to consumer financings, are cancelable, upon notice, at the option of the Firm.

To provide for the risk of loss inherent in wholesale related contracts, an allowance for credit losses on lending-related commitments is maintained. See Note 15 on pages 178–180 of this Annual Report for further discussion of the allowance for credit losses on lending-related commitments.

The following table summarizes the contractual amounts of off-balance sheet lending-related financial instruments and guarantees and the related allowance for credit losses on lending-related commitments at December 31, 2008 and 2007.

Off-balance sheet lending-related financial instruments and guarantees

	Contractual amount		Allowance for lending-related commitments	
December 31, (in millions)	**2008**	2007	**2008**	2007
Lending-related				
Consumer[a]	**$ 741,507**	$ 815,936	**$ 25**	$ 15
Wholesale:				
Other unfunded commitments to extend credit[b][c][d][e]	**225,863**	250,954	**349**	571
Asset purchase agreements[f]	**53,729**	90,105	**9**	9
Standby letters of credit and financial guarantees[c][g][h]	**95,352**	100,222	**274**	254
Other letters of credit[c]	**4,927**	5,371	**2**	1
Total wholesale	**379,871**	446,652	**634**	835
Total lending-related	**$ 1,121,378**	$ 1,262,588	**$ 659**	$ 850
Other guarantees				
Securities lending guarantees[i]	**$ 169,281**	$ 385,758	**NA**	NA
Residual value guarantees	**670**	NA	**NA**	NA
Derivatives qualifying as guarantees[j]	**83,835**	85,262	**NA**	NA

(a) Includes credit card and home equity lending-related commitments of $623.7 billion and $95.7 billion, respectively, at December 31, 2008; and $714.8 billion and $74.2 billion, respectively, at December 31, 2007. These amounts for credit card and home equity lending-related commitments represent the total available credit for these products. The Firm has not experienced, and does not anticipate, that all available lines of credit for these products will be utilized at the same time. The Firm can reduce or cancel these lines of credit by providing the borrower prior notice or, in some cases, without notice as permitted by law.

(b) Includes unused advised lines of credit totaling $36.3 billion and $38.4 billion at December 31, 2008 and 2007, respectively, which are not legally binding. In regulatory filings with the Federal Reserve, unused advised lines are not reportable.

(c) Represents contractual amount net of risk participations totaling $28.3 billion at both December 31, 2008 and 2007.

(d) Excludes unfunded commitments to third-party private equity funds of $1.4 billion and $881 million at December 31, 2008 and 2007, respectively. Also excludes unfunded commitments for other equity investments of $1.0 billion and $903 million at December 31, 2008 and 2007, respectively.

(e) Includes commitments to investment and noninvestment grade counterparties in connection with leveraged acquisitions of $3.6 billion and $8.2 billion at December 31, 2008 and 2007, respectively.

(f) Largely represents asset purchase agreements with the Firm's administered multi-seller, asset-backed commercial paper conduits. It also includes $96 million and $1.1 billion of asset purchase agreements to other third-party entities at December 31, 2008 and 2007, respectively.

(g) JPMorgan Chase held collateral relating to $31.0 billion and $31.5 billion of these arrangements at December 31, 2008 and 2007, respectively. Prior periods have been revised to conform to the current presentation.

(h) Includes unissued standby letters of credit commitments of $39.5 billion and $50.7 billion at December 31, 2008 and 2007, respectively.

(i) Collateral held by the Firm in support of securities lending indemnification agreements was $170.1 billion and $390.5 billion at December 31, 2008 and 2007, respectively. Securities lending collateral comprises primarily cash, securities issued by governments that are members of the Organisation for Economic Co-operation and Development and U.S. government agencies.

(j) Represents notional amounts of derivatives qualifying as guarantees.

Other unfunded commitments to extend credit

Unfunded commitments to extend credit are agreements to lend or to purchase securities only when a customer has complied with predetermined conditions, and they generally expire on fixed dates.

Other unfunded commitments to extend credit include commitments to U.S. domestic states and municipalities, hospitals and other not-for-profit entities to provide funding for periodic tenders of their variable-rate demand bond obligations or commercial paper. Performance by the Firm is required in the event that the variable-rate demand bonds or commercial paper cannot be remarketed to new investors. The performance required of the Firm under these agreements is conditional and limited by certain termination events, which include bankruptcy and the credit rating downgrade of the issuer of the variable-rate demand bonds or commercial paper to below certain predetermined thresholds. The commitment period is generally one to three years. The amount of commitments related to variable-rate demand bonds and commercial paper of U.S. domestic states and municipalities, hospitals and not-for-profit entities at December 31, 2008 and 2007, was $23.5 billion and $24.1 billion, respectively.

Included in other unfunded commitments to extend credit are commitments to investment and noninvestment grade counterparties in connection with leveraged acquisitions. These commitments are dependent on whether the acquisition by the borrower is successful, tend to be short-term in nature and, in most cases, are subject to certain conditions based on the borrower's financial condition or other factors. Additionally, the Firm often syndicates portions of the commitment to other investors, depending on market conditions. These commitments often contain flexible pricing features to adjust for changing market conditions prior to closing. Alternatively, the borrower may turn to the capital markets for required funding instead of drawing on the commitment provided by the Firm, and the commitment may expire unused. As such, these commitments may not necessarily be indicative of the Firm's actual risk, and the total commitment amount may not reflect actual future cash flow requirements. The amount of commitments related to leveraged acquisitions at December 31, 2008 and 2007, was $3.6 billion and $8.2 billion, respectively. For further information, see Note 4 and Note 5 on pages 141–155 and 156–158, respectively, of this Annual Report.

FIN 45 guarantees

FIN 45 establishes accounting and disclosure requirements for guarantees, requiring that a guarantor recognize, at the inception of a guarantee, a liability in an amount equal to the fair value of the obligation undertaken in issuing the guarantee. FIN 45 defines a guarantee as a contract that contingently requires the guarantor to pay a guaranteed party, based upon: (a) changes in an underlying asset, liability or equity security of the guaranteed party; or (b) a third party's failure to perform under a specified agreement. The Firm considers the following off-balance sheet lending-related arrangements to be guarantees under FIN 45: certain asset purchase agreements, standby letters of credit and financial guarantees, securities lending indemnifications, certain indemnification agreements included within third-party contractual arrangements and certain derivative contracts. These guarantees are described in further detail below.

The fair value at inception of the obligation undertaken when issuing the guarantees and commitments that qualify under FIN 45 is typically equal to the net present value of the future amount of premium receivable under the contract. The Firm has recorded this amount in other liabilities with an offsetting entry recorded in other assets. As cash is received under the contract, it is applied to the premium receivable recorded in other assets, and the fair value of the liability recorded at inception is amortized into income as lending & deposit-related fees over the life of the guarantee contract. The amount of the liability related to FIN 45 guarantees recorded at December 31, 2008 and 2007, excluding the allowance for lending-related commitments and derivative contracts discussed below, was approximately $535 million and $335 million, respectively.

Asset purchase agreements

The majority of the Firm's unfunded commitments are not guarantees as defined in FIN 45, except for certain asset purchase agreements that are principally used as a mechanism to provide liquidity to SPEs, predominantly multi-seller conduits, as described in Note 17 on pages 189–198 of this Annual Report. The conduit's administrative agent can require the liquidity provider to perform under their asset purchase agreement with the conduit at any time. These agreements may cause the Firm to purchase an asset from the SPE at an amount above the asset's then fair value, in effect providing a guarantee of the initial value of the reference asset as of the date of the agreement. In most instances, third-party credit enhancements of the SPE mitigate the Firm's potential losses on these agreements.

The carrying value of asset purchase agreements of $147 million at December 31, 2008, classified in accounts payable and other liabilities on the Consolidated Balance Sheets, includes $9 million for the allowance for lending-related commitments and $138 million for the FIN 45 guarantee liability.

Standby letters of credit

Standby letters of credit ("SBLC") and financial guarantees are conditional lending commitments issued by the Firm to guarantee the performance of a customer to a third party under certain arrangements, such as commercial paper facilities, bond financings, acquisition financings, trade and similar transactions. The majority of SBLCs mature in 5 years or less; as of December 31, 2008 and 2007, 64% and 52%, respectively, of these arrangements mature within three years. The Firm has recourse to recover from the customer any amounts paid under these guarantees; in addition, the Firm may hold cash or other highly liquid collateral to support these guarantees. The carrying value of standby letters of credit of $673 million and $590 million at December 31, 2008 and 2007, respectively, which is classified in accounts payable and other liabilities in the Consolidated Balance Sheets, includes $276 million and $255 million at December 31, 2008 and 2007, respectively, for the allowance for lending-related commitments, and $397 million and $335 million at December 31, 2008 and 2007, respectively, for the FIN 45 guarantee.

The following table summarizes the type of facilities under which standby letters of credit and other letters of credit arrangements are outstanding by the ratings profiles of the Firm's customers as of December 31, 2008 and 2007. The ratings scale is representative of the payment or performance risk to the Firm under the guarantee and is based upon the Firm's internal risk ratings, which generally correspond to ratings defined by S&P and Moody's.

	2008		2007	
December 31, (in millions)	Standby letters of credit and other financial guarantees	Other letters of credit	Standby letters of credit and other financial guarantees	Other letters of credit
Investment-grade[a]	**$ 73,394**	**$ 4,165**	$ 71,904	$ 4,153
Noninvestment-grade[a]	**21,958**	**762**	28,318	1,218
Total contractual amount	**$ 95,352**[b]	**$ 4,927**	$ 100,222[b]	$ 5,371
Allowance for lending-related commitments	**$ 274**	**$ 2**	$ 254	$ 1
Commitments with collateral	**30,972**	**1,000**	31,502	809

(a) Ratings scale is based upon the Firm's internal ratings which generally correspond to ratings defined by S&P and Moody's.
(b) Represents contractual amount net of risk participations totaling $28.3 billion at both December 31, 2008 and 2007.

Derivatives qualifying as guarantees

In addition to the contracts described above, the Firm transacts certain derivative contracts that meet the characteristics of a guarantee under FIN 45. These contracts include written put options that require the Firm to purchase assets upon exercise by the option holder at a specified price by a specified date in the future. The Firm may enter into written put option contracts in order to meet client needs, or for trading purposes. The terms of written put options are typically five years or less. Derivative guarantees also include contracts such as stable value derivatives that require the Firm to make a payment of the difference between the market value and the book value of a counterparty's reference portfolio of assets in the event that market value is less than book value and certain other conditions have been met. Stable value derivatives, commonly referred to as "stable value wraps", are transacted in order to allow investors to realize investment returns with less volatility than an unprotected portfolio, and typically have a longer-term maturity or allow either party to terminate the contract subject to contractually specified terms.

Derivative guarantees are recorded on the Consolidated Balance Sheets at fair value in trading assets and trading liabilities. The total notional value of the derivatives that the Firm deems to be guarantees was $83.8 billion and $85.3 billion at December 31, 2008 and 2007, respectively. The notional value generally represents the Firm's maximum exposure to derivatives qualifying as guarantees, although exposure to certain stable value derivatives is contractually limited to a substantially lower percentage of the notional value. The fair value of the contracts reflects the probability of whether the Firm will be required to perform under the contract. The fair value related to derivative guarantees was a derivative receivable of $184 million and $213 million, and a derivative payable of $5.6 billion and $2.5 billion at December 31, 2008 and 2007, respectively. The Firm reduces exposures to these contracts by entering into offsetting transactions, or by entering into contracts that hedge the market risk related to the derivative guarantees.

In addition to derivative contracts that meet the characteristics of a guarantee under FIN 45, the Firm is both a purchaser and seller of credit protection in the credit derivatives market. For a further discussion of credit derivatives, see Note 32 on pages 214–217 of this Annual Report.

Securities lending indemnification

Through the Firm's securities lending program, customers' securities, via custodial and non-custodial arrangements, may be lent to third parties. As part of this program, the Firm provides an indemnification in the lending agreements which protects the lender against the failure of the third-party borrower to return the lent securities in the event the Firm did not obtain sufficient collateral. To minimize its liability under these indemnification agreements, the Firm obtains cash or other highly liquid collateral with a market value exceeding 100% of the value of the securities on loan from the borrower. Collateral is marked to market daily to help assure that collateralization is adequate. Additional collateral is called from the borrower if a shortfall exists, or collateral may be released to the borrower in the event of overcollateralization. If a borrower defaults, the Firm would use the collateral held to purchase replacement securities in the market or to credit the lending customer with the cash equivalent thereof.

Also, as part of this program, the Firm invests cash collateral received from the borrower in accordance with approved guidelines.

Based upon historical experience, management believes that risk of loss under its indemnification obligations is remote.

Indemnification agreements – general

In connection with issuing securities to investors, the Firm may enter into contractual arrangements with third parties that may require the Firm to make a payment to them in the event of a change in tax law or an adverse interpretation of tax law. In certain cases, the contract also may include a termination clause, which would allow the Firm to settle the contract at its fair value in lieu of making a payment under the indemnification clause. The Firm may also enter into indemnification clauses in connection with the licensing of software to clients ("software licensees") or when it sells a business or assets to a third party ("third-party purchasers"), pursuant to which it indemnifies software licensees for claims of liability or damages that may occur subsequent to the licensing of the software, or third-party purchasers for losses they may incur due to actions taken by the Firm prior to the sale of the business or assets. It is difficult to estimate the Firm's maximum exposure under these indemnification arrangements, since this would require an assessment of future changes in tax law and future claims that may be made against the Firm that have not yet occurred. However, based upon historical experience, management expects the risk of loss to be remote.

Loan sale and securitization-related indemnifications

Indemnifications for breaches of representations and warranties

As part of the Firm's loan sale and securitization activities, as described in Note 14 and Note 16 on pages 175–178 and 180–188, respectively, of this Annual Report, the Firm generally makes representations and warranties in its loan sale and securitization agreements that the loans sold meet certain requirements. These agreements may require the Firm (including in its roles as a servicer) to repurchase the loans and/or indemnify the purchaser of the loans against losses due to any breaches of such representations or warranties. Generally, the maximum amount of future payments the Firm would be required to make for breaches under these representations and warranties would be equal to the current amount of assets held by such securitization-related SPEs plus, in certain circumstances, accrued and unpaid interest on such loans and certain expense.

At December 31, 2008 and 2007, the Firm had recorded a repurchase liability of $1.1 billion and $15 million, respectively.

Loans sold with recourse

The Firm provides servicing for mortgages and certain commercial lending products on both a recourse and nonrecourse basis. In nonrecourse servicing, the principal credit risk to the Firm is the cost of temporary servicing advances of funds (i.e., normal servicing advances). In recourse servicing, the servicer agrees to share credit risk with the owner of the mortgage loans, such as the Federal National Mortgage Association or the Federal Home Loan Mortgage Corporation or a private investor, insurer or guarantor. Losses on recourse servicing predominantly occur when foreclosure sales proceeds of the property underlying a defaulted loan are less than the sum of the outstanding principal balance, plus accrued interest on the loan and the cost of holding and disposing of the underlying property. The Firm's loan sale transactions have primarily been executed on a nonrecourse basis, thereby effectively transferring the risk of future credit losses to the purchaser of the mortgage-backed securities issued by the trust. At December 31, 2008 and 2007, the unpaid principal balance of loans sold with recourse totaled $15.0 billion and $557 million, respectively. The increase in loans sold with recourse between December 31, 2008 and 2007, was driven by the Washington Mutual transaction. The carrying value of the related liability that the Firm had recorded, which is representative of the Firm's view of the likelihood it will have to perform under this guarantee, was $241 million and zero at December 31, 2008 and 2007, respectively.

Credit card charge-backs

Prior to November 1, 2008, the Firm was a partner with one of the leading companies in electronic payment services in a joint venture operating under the name of Chase Paymentech Solutions, LLC (the "joint venture"). The joint venture was formed in October 2005, as a result of an agreement by the Firm and First Data Corporation, its joint venture partner, to integrate the companies' jointly-owned Chase Merchant Services and Paymentech merchant businesses. The joint venture provided merchant processing services in the United States and Canada. The dissolution of the joint venture was completed on November 1, 2008, and JPMorgan Chase retained approximately 51% of the business under the Chase Paymentech Solutions name.

Under the rules of Visa USA, Inc., and MasterCard International, JPMorgan Chase Bank, N.A., is liable primarily for the amount of each processed credit card sales transaction that is the subject of a dispute between a cardmember and a merchant. If a dispute is resolved in the cardmember's favor, Chase Paymentech Solutions will (through the cardmember's issuing bank) credit or refund the amount to the cardmember and will charge back the transaction to the merchant. If Chase Paymentech Solutions is unable to collect the amount from the merchant, Chase Paymentech Solutions will bear the loss for the amount credited or refunded to the cardmember. Chase Paymentech Solutions mitigates this risk by withholding future settlements, retaining cash reserve accounts or by obtaining other security. However, in the unlikely event that: (1) a merchant ceases operations and is unable to deliver products, services or a refund; (2) Chase Paymentech Solutions does not have sufficient collateral from the merchant to provide customer refunds; and (3) Chase Paymentech Solutions does not have sufficient financial resources to provide customer refunds, JPMorgan Chase Bank, N.A., would be liable for the amount of the transaction. For the year ended December 31, 2008, Chase Paymentech Solutions incurred aggregate credit losses of $13 million on $713.9 billion of aggregate volume processed, and at December 31, 2008, it held $222 million of collateral. For the year ended December 31, 2007, the joint venture incurred aggregate credit losses of $10 million on $719.1 billion of aggregate volume processed, and at December 31, 2007, the joint venture held $779 million of collateral. The Firm believes that, based upon historical experience and the collateral held by Chase Paymentech Solutions, the amount of the Firm's charge back-related obligations, which is representative of the payment or performance risk to the Firm, is immaterial.

Credit card association, exchange and clearinghouse guarantees

The Firm holds an equity interest in VISA Inc. During October 2007, certain VISA-related entities completed a series of restructuring transactions to combine their operations, including VISA USA, under one holding company, VISA Inc. Upon the restructuring, the Firm's membership interest in VISA USA was converted into an equity interest in VISA Inc. VISA Inc. sold shares via an initial public offering and used a portion of the proceeds from the offering to redeem a portion of the Firm's equity interest in Visa Inc. Prior to the restructuring, VISA USA's by-laws obligated the Firm upon demand by VISA USA to indemnify VISA USA for, among other things, litigation obligations of Visa USA. The accounting for that guarantee was not subject to fair value accounting under FIN 45, because the guarantee was in effect prior to the effective date of FIN 45. Upon the restructuring event, the Firm's obligation to indemnify Visa Inc. was limited to certain identified litigations. Such a limitation is deemed a modification of the indemnity by-law and, accordingly, is now subject to the provisions of FIN 45. The value of the litigation guarantee has been recorded in the Firm's financial statements based on its fair value; the net amount recorded (within other liabilities) did not have a material adverse effect on the Firm's financial statements.

In addition to Visa, the Firm is a member of other associations, including several securities and futures exchanges and clearinghouses, both in the United States and other countries. Membership in some of these organizations requires the Firm to pay a pro rata share of the losses incurred by the organization as a result of the default of another member. Such obligations vary with different organizations. These obligations may be limited to members who dealt with the defaulting member or to the amount (or a multiple of the amount) of the Firm's contribution to a member's guarantee fund, or, in a few cases, the obligation may be unlimited. It is difficult to estimate the Firm's maximum exposure under these membership agreements, since this would require an assessment of future claims that may be made against the Firm that have not yet occurred. However, based upon historical experience, management expects the risk of loss to be remote.

Residual value guarantee

In connection with the Bear Stearns merger, the Firm succeeded to an operating lease arrangement for the building located at 383 Madison Avenue in New York City (the "Synthetic Lease"). Under the terms of the Synthetic Lease, the Firm is obligated to make periodic payments based on the lessor's underlying interest costs. The Synthetic Lease expires on November 1, 2010. Under the terms of the Synthetic Lease, the Firm has the right to purchase the building for the amount of the then outstanding indebtedness of the lessor, or to arrange for the sale of the building, with the proceeds of the sale to be used to satisfy the lessor's debt obligation. If the sale does not generate sufficient proceeds to satisfy the lessor's debt obligation, the Firm is required to fund the shortfall up to a maximum residual value guarantee. As of December 31, 2008, there was no expected shortfall, and the maximum residual value guarantee was approximately $670 million. Under a separate ground lease, the land on which the building is built was leased to an affiliate of Bear Stearns which, as part of the Synthetic Lease, assigned this position to the Synthetic Lease lessor. The owner of the land sued the Firm, alleging that certain provisions of the merger agreement violated a "right of first offer" provision of the ground lease. The Firm's motion to dismiss the lawsuit was granted, and a judgment of dismissal was entered on January 12, 2009. The owner has filed a notice of appeal.

Note 34 – Credit risk concentrations

Concentrations of credit risk arise when a number of customers are engaged in similar business activities or activities in the same geographic region, or when they have similar economic features that would cause their ability to meet contractual obligations to be similarly affected by changes in economic conditions.

JPMorgan Chase regularly monitors various segments of its credit portfolio to assess potential concentration risks and to obtain collateral when deemed necessary. Senior management is significantly involved in the credit approval and review process, and risk levels are adjusted as needed to reflect management's risk tolerance.

In the Firm's wholesale portfolio, risk concentrations are evaluated primarily by industry and geographic region, and monitored regularly on both an aggregate portfolio level and on an individual customer basis. Management of the Firm's wholesale exposure is accomplished through loan syndication and participation, loan sales, securitizations, credit derivatives, use of master netting agreements, and collateral and other risk-reduction techniques. In the consumer portfolio, concentrations are evaluated primarily by product and by U.S. geographic region, with a key focus on trends and concentrations at the portfolio level, where potential risk concentrations can be remedied through changes in underwriting policies and portfolio guidelines.

The Firm does not believe exposure to any one loan product with varying terms (e.g., interest-only payments for an introductory period, option ARMs) or exposure to loans with high loan-to-value ratios would result in a significant concentration of credit risk. Terms of loan products and collateral coverage are included in the Firm's assessment when extending credit and establishing its allowance for loan losses.

For further information regarding on-balance sheet credit concentrations by major product and geography, see Note 14 on pages 175–178 and Note 15 on pages 178–180 of this Annual Report. For information regarding concentrations of off-balance sheet lending-related financial instruments by major product, see Note 33 on pages 218–222 of this Annual Report.

The table below presents both on- and off-balance sheet wholesale- and consumer-related credit exposure as of December 31, 2008 and 2007.

	2008				2007

(a) Primarily represents margin loans to prime and retail brokerage customers which are included in accrued interest and accounts receivable on the Consolidated Balance Sheets.
(b) Excludes $85.6 billion and $72.7 billion of securitized credit card receivables at December 31, 2008 and 2007, respectively.
(c) Represents lending-related financial instruments.

Note 35 – International operations

The following table presents income statement information of JPMorgan Chase by major international geographic area. The Firm defines international activities as business transactions that involve customers residing outside of the U.S., and the information presented below is based primarily upon the domicile of the customer or the location from which the customer relationship is managed. However, many of the Firm's U.S. operations serve international businesses.

As the Firm's operations are highly integrated, estimates and subjective assumptions have been made to apportion revenue and expense between U.S. and international operations. These estimates and assumptions are consistent with the allocations used for the Firm's segment reporting as set forth in Note 37 on pages 226–227 of this Annual Report.

The Firm's long-lived assets for the periods presented are not considered by management to be significant in relation to total assets. The majority of the Firm's long-lived assets are located in the United States.

Year ended December 31, (in millions)	Revenue[a]	Expense[b]	Income (loss) from continuing operations before income tax expense (benefit)	Net income
2008				
Europe/Middle East and Africa	**$ 11,449**	**$ 8,403**	**$ 3,046**	**$ 2,483**

Cash interest paid	**$ 7,485**	$ 7,470	$ 5,485
Cash income taxes paid	**156**	5,074	3,599

(a) Subsidiaries include trusts that issued guaranteed capital debt securities ("issuer trusts"). As a result of FIN 46R, the Parent Company deconsolidated these trusts in 2003. The Parent Company received dividends of $15 million, $18 million and $23 million from the issuer trusts in 2008, 2007 and 2006, respectively. For further discussion on these issuer trusts, see Note 23 on page 204 of this Annual Report.

(b) Amounts for 2007 have been revised to reflect the push down of certain litigation expense, which had previously been recorded at the parent company level, to the bank subsidiary level. There was no change to net income as the increase in Parent Company profitability was offset by a decrease in the net income of subsidiaries.

(c) At December 31, 2008, debt that contractually matures in 2009 through 2013 totaled $25.8 billion, $28.6 billion, $29.3 billion, $25.3 billion and $11.8 billion, respectively.

(d) Includes $39.8 billion of Bear Stearns' long-term debt assumed by JPMorgan Chase & Co.

(e) Includes the conversion of Bear Stearns' preferred stock into JPMorgan Chase preferred stock.

Note 37 – Business segments

JPMorgan Chase is organized into six major reportable business segments — Investment Bank, Retail Financial Services, Card Services, Commercial Banking, Treasury & Securities Services and Asset Management, as well as a Corporate/Private Equity segment. The segments are based upon the products and services provided or the type of customer served, and they reflect the manner in which financial information is currently evaluated by management. Results of these lines of business are presented on a managed basis. For a definition of managed basis, see Explanation and Reconciliation of the Firm's use of non-GAAP financial measures, on pages 50–51 of this Annual Report. For a further discussion concerning JPMorgan Chase's business segments, see Business segment results on pages 52–53 of this Annual Report.

Segment results

The following table provides a summary of the Firm's segment results for 2008, 2007 and 2006 on a managed basis. The impact of credit card securitizations and tax-equivalent adjustments have been included in Reconciling items so that the total Firm results are on a reported basis.

(a) In addition to analyzing the Firm's results on a reported basis, management reviews the Firm's results and the results of the lines of business on a "managed basis," which is a non-GAAP financial measure. The Firm's definition of managed basis starts with the reported U.S. GAAP results and includes certain reclassifications that do not have any impact on net income as reported by the lines of business or by the Firm as a whole.

(b) TSS is charged a credit reimbursement related to certain exposures managed within IB credit portfolio on behalf of clients shared with TSS.

(c) Includes merger costs which are reported in the Corporate/Private Equity segment. Merger costs attributed to the business segments for 2008, 2007 and 2006 were as follows.

Year ended December 31, (in millions)	**2008**	2007	2006
Investment Bank	**$183**	$ (2)	$ 2
Retail Financial Services	**90**	14	24
Card Services	**20**	(1)	29
Commercial Banking	**4**	(1)	1
Treasury & Securities Services	**—**	121	117
Asset Management	**3**	20	23
Corporate/Private Equity	**132**	58	109

(d) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual from the FDIC for $1.9 billion. The fair value of the net assets acquired exceeded the purchase price, which resulted in negative goodwill. In accordance with SFAS 141, nonfinancial assets that are not held-for-sale, such as premises and equipment and other intangibles, acquired in the Washington Mutual transaction were written down against that negative goodwill. The negative goodwill that remained after writing down nonfinancial assets was recognized as an extraordinary gain.

(e) Included a $1.5 billion charge to conform Washington Mutual's loan loss reserve to JPMorgan Chase's allowance methodology.

Line of business equity increased during the second quarter of 2008 in IB and AM due to the Bear Stearns merger and, for AM, the purchase of the additional equity interest in Highbridge. At the end of the third quarter of 2008, equity was increased for each line of business with a view toward the future implementation of the new Basel II capital rules. In addition, equity allocated to RFS, CS and CB was increased as a result of the Washington Mutual transaction.

Discontinued operations

As a result of the transaction with The Bank of New York, selected corporate trust businesses have been transferred from TSS to the Corporate/Private Equity segment and reported in discontinued operations for all periods reported.

(f) In November 2008, the Firm transferred $5.8 billion of higher quality credit card loans from the legacy Chase portfolio to a securitization trust previously established by Washington Mutual ("the Trust"). As a result of converting higher credit quality Chase-originated on-book receivables to the Trust's seller's interest which has a higher overall loss rate reflective of the total assets within the Trust, approximately $400 million of incremental provision expense was recorded during the fourth quarter. This incremental provision expense was recorded in Corporate segment as the action related to the acquisition of Washington Mutual's banking operations. For further discussion of credit card securitizations, see Note 16 on page 182 of this Annual Report.

(g) Managed results for credit card exclude the impact of CS securitizations on total net revenue, provision for credit losses and average assets, as JPMorgan Chase treats the sold receivables as if they were still on the balance sheet in evaluating the credit performance of the entire managed credit card portfolio as operations are funded, and decisions are made about allocating resources such as employees and capital, based upon managed information. These adjustments are eliminated in reconciling items to arrive at the Firm's reported U.S. GAAP results. The related securitization adjustments were as follows.

Year ended December 31, (in millions)	**2008**	2007	2006
Noninterest revenue	**$ (3,333)**	$ (3,255)	$ (3,509)
Net interest income	**6,945**	5,635	5,719
Provision for credit losses	**3,612**	2,380	2,210
Average assets	**76,904**	66,780	65,266

(h) Segment managed results reflect revenue on a tax-equivalent basis with the corresponding income tax impact recorded within income tax expense (benefit). These adjustments are eliminated in reconciling items to arrive at the Firm's reported U.S. GAAP results. Tax-equivalent adjustments for the years ended December 31, 2008, 2007 and 2006 were as follows.

Year ended December 31, (in millions)	**2008**	2007	2006
Noninterest revenue	**$ 1,329**	$ 683	$ 676
Net interest income	**579**	377	228
Income tax expense	**1,908**	1,060	904

(i) Ratio is based upon net income.

(a) The Firm adopted SFAS 157 in the first quarter of 2007. See Note 4 on pages 141–155 of this Annual Report for additional information.
(b) For a discussion of accounting conformity, see provision for credit losses on page 47 and consumer credit portfolio discussion on page 103.
(c) For a discussion of the extraordinary gain, see Note 2 on pages 135–140.
(d) JPMorgan Chase's common stock is listed and traded on the New York Stock Exchange, the London Stock Exchange and the Tokyo Stock Exchange. The high, low and closing prices of JPMorgan Chase's common stock are from The New York Stock Exchange Composite Transaction Tape.
(e) Excludes purchased wholesale loans held-for-sale.
(f) During the second quarter of 2008, the policy for classifying subprime mortgage and home equity loans as nonperforming was changed to conform to all other home lending products. Amounts for 2007 have been revised to reflect this change.
(g) End-of-period and average loans held-for-sale and loans at fair value were excluded when calculating the allowance coverage ratios and net charge-off rates, respectively.
(h) Common equivalent shares have been excluded from the computation of diluted earnings per share for the third quarter of 2008, as the effect on income (loss) before extraordinary gain would be antidilutive.
(i) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the Bear Stearns merger was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.

(a) The Firm adopted SFAS 157 in the first quarter of 2007. See Note 4 on pages 141–155 of this Annual Report for additional information.
(b) For a discussion of accounting conformity, see provision for credit losses on page 47 and consumer credit portfolio discussion on page 103.
(c) On October 1, 2006, JPMorgan Chase & Co. completed the exchange of selected corporate trust businesses for the consumer, business banking and middle-market banking businesses of The Bank of New York Company Inc. The results of operations of these corporate trust businesses are reported as discontinued operations for each period prior to 2007.
(d) For a discussion of the extraordinary gain, see Note 2 on pages 135–140.
(e) JPMorgan Chase's common stock is listed and traded on the New York Stock Exchange, the London Stock Exchange and the Tokyo Stock Exchange. The high, low and closing prices of JPMorgan Chase's common stock are from The New York Stock Exchange Composite Transaction Tape.
(f) Excludes purchased wholesale loans held-for-sale.
(g) During the second quarter of 2008, the policy for classifying subprime mortgage and home equity loans as nonperforming was changed to conform to all other home lending products. Amounts for 2007 have been revised to reflect this change. Periods prior to 2007 have not been revised as the impact was not material.
(h) End-of-period and average loans held-for-sale and loans at fair value were excluded when calculating the allowance coverage ratios and net charge-off rates, respectively.
(i) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank. On May 30, 2008, the Bear Stearns merger was consummated. Each of these transactions was accounted for as a purchase and their respective results of operations are included in the Firm's results from each respective transaction date. For additional information on these transactions, see Note 2 on pages 135–140 of this Annual Report.
(j) On July 1, 2004, Bank One Corporation merged with and into JPMorgan Chase. Accordingly, 2004 results include six months of the combined Firm's results and six months of heritage JPMorgan Chase results.

Glossary of terms

ACH: Automated Clearing House.

Advised lines of credit: An authorization which specifies the maximum amount of a credit facility the Firm has made available to an obligor on a revolving but non-binding basis. The borrower receives written or oral advice of this facility. The Firm may cancel this facility at any time.

AICPA: American Institute of Certified Public Accountants.

AICPA Statement of Position ("SOP") 03-3: "Accounting for Certain Loans or Debt Securities Acquired in a Transfer."

AICPA SOP 07-1: "Clarification of the Scope of the Audit and Accounting Guide Investment Companies and Accounting by Parent Companies and Equity Method Investors for Investments in Investment Companies."

AICPA SOP 98-1: "Accounting for the Costs of Computer Software Developed or Obtained for Internal Use."

Alternative assets: The following types of assets constitute alternative investments – hedge funds, currency, real estate and private equity.

APB 18: Accounting Principles Board Opinion No. 18, "The Equity Method of Accounting for Investments in Common Stock."

APB 25: Accounting Principles Board Opinion No. 25, "Accounting for Stock Issued to Employees."

Assets under management: Represent assets actively managed by Asset Management on behalf of Institutional, Retail, Private Banking, Private Wealth Management and Bear Stearns Brokerage clients. Excludes assets managed by American Century Companies, Inc., in which the Firm has a 43% ownership interest as of December 31, 2008.

Assets under supervision: Represent assets under management as well as custody, brokerage, administration and deposit accounts.

Average managed assets: Refers to total assets on the Firm's Consolidated Balance Sheets plus credit card receivables that have been securitized.

Beneficial interest issued by consolidated VIEs: Represents the interest of third-party holders of debt/equity securities, or other obligations, issued by VIEs that JPMorgan Chase consolidates under FIN 46R. The underlying obligations of the VIEs consist of short-term borrowings, commercial paper and long-term debt. The related assets consist of trading assets, available-for-sale securities, loans and other assets.

Benefit obligation: Refers to the projected benefit obligation for pension plans and the accumulated postretirement benefit obligation for OPEB plans.

Combined effective loan-to-value ratio: For residential real estate loans, an indicator of how much equity a borrower has in a secured borrowing based on current estimates of the value of the collateral and considering all lien positions related to the property.

Contractual credit card charge-off: In accordance with the Federal Financial Institutions Examination Council policy, credit card loans are charged off by the end of the month in which the account becomes 180 days past due or within 60 days from receiving notification of the filing of bankruptcy, whichever is earlier.

Credit card securitizations: Card Services' managed results excludes the impact of credit card securitizations on total net revenue, the provision for credit losses, net charge-offs and loan receivables. Through securitization, the Firm transforms a portion of its credit card receivables into securities, which are sold to investors. The credit card receivables are removed from the Consolidated Balance Sheets through the transfer of the receivables to a trust, and through the sale of undivided interests to investors that entitle the investors to specific cash flows generated from the credit card receivables. The Firm retains the remaining undivided interests as seller's interests, which are recorded in loans on the Consolidated Balance Sheets. A gain or loss on the sale of credit card receivables to investors is recorded in other income. Securitization also affects the Firm's Consolidated Statements of Income, as the aggregate amount of interest income, certain fee revenue and recoveries that is in excess of the aggregate amount of interest paid to investors, gross credit losses and other trust expense related to the securitized receivables are reclassified into credit card income in the Consolidated Statements of Income.

Credit derivatives: Contractual agreements that provide protection against a credit event on one or more referenced credits. The nature of a credit event is established by the protection buyer and protection seller at the inception of a transaction, and such events include bankruptcy, insolvency or failure to meet payment obligations when due. The buyer of the credit derivative pays a periodic fee in return for a payment by the protection seller upon the occurrence, if any, of a credit event.

Credit cycle: A period of time over which credit quality improves, deteriorates and then improves again. The duration of a credit cycle can vary from a couple of years to several years.

Deposit margin: Represents net interest income on deposits expressed as a percentage of average deposits.

Discontinued operations: A component of an entity that is classified as held-for-sale or that has been disposed of from ongoing operations in its entirety or piecemeal, and for which the entity will not have any significant, continuing involvement. A discontinued operation may be a separate major business segment, a component of a major business segment or a geographical area of operations of the entity that can be separately distinguished operationally and for financial reporting purposes.

EITF: Emerging Issues Task Force.

EITF Issue 06-11: "Accounting for Income Tax Benefits of Dividends on Share-Based Payment Awards."

EITF Issue 02-3: "Issues Involved in Accounting for Derivative Contracts Held for Trading Purposes and Contracts Involved in Energy Trading and Risk Management Activities."

EITF Issue 99-20: "Recognition of Interest Income and Impairment on Purchased and Retained Beneficial Interests in Securitized Financial Assets."

FASB: Financial Accounting Standards Board.

FICO: Fair Isaac Corporation.

FIN 39: FASB Interpretation No. 39, "Offsetting of Amounts Related to Certain Contracts – an interpretation of APB Opinion No. 10 and FASB Statement No. 105."

FIN 41: FASB Interpretation No. 41, "Offsetting of Amounts Related to Certain Repurchase and Reverse Repurchase Agreements – an interpretation of APB Opinion No. 10 and a Modification of FASB Interpretation No. 39."

FIN 45: FASB Interpretation No. 45, "Guarantor's Accounting and Disclosure Requirements for Guarantees, including Indirect Guarantees of Indebtedness of Others – an interpretation of FASB Statements No. 5, 57 and 107 and a rescission of FASB Interpretation No. 34."

FIN 46R: FASB Interpretation No. 46 (revised December 2003), "Consolidation of Variable Interest Entities – an interpretation of ARB No. 51."

FIN 47: FASB Interpretation No. 47, "Accounting for Conditional Asset Retirement Obligations – an interpretation of FASB Statement No. 143."

FIN 48: FASB Interpretation No. 48, "Accounting for Uncertainty in Income Taxes – an interpretation of FASB Statement No. 109."

Forward points: Represents the interest rate differential between two currencies, which is either added to or subtracted from the current exchange rate (i.e., "spot rate") to determine the forward exchange rate.

FSP: FASB Staff Position.

FSP FAS 123(R)-3: "Transition Election Related to Accounting for the Tax Effects of Share-Based Payment Awards."

FSP FAS 132(R)-1: "Employers' Disclosures about Postretirement Benefit Plan Assets."

FSP FAS 133-1 and FIN 45-4: "Disclosures about Credit Derivatives and Certain Guarantees: An Amendment of FASB Statement No. 133 and FASB Interpretation No. 45; and Clarification of the Effective Date of FASB Statement No. 161."

FSP FAS 140-4 and FIN 46(R)-8: "Disclosures by Public Entities (Enterprises) about Transfers of Financial Assets and Interests in Variable Interest Entities."

FSP EITF 03-6-1: "Determining Whether Instruments Granted in Share-Based Payment Transactions Are Participating Securities."

FSP FAS 140-3: "Accounting for Transfers of Financial Assets and Repurchase Financing Transactions."

FSP FIN 39-1: "Amendment of FASB Interpretation No. 39."

FSP FIN 46(R)-7: "Application of FASB Interpretation No. 46(R) to Investment Companies."

Interchange income: A fee that is paid to a credit card issuer in the clearing and settlement of a sales or cash advance transaction.

Interests in purchased receivables: Represent an ownership interest in cash flows of an underlying pool of receivables transferred by a third-party seller into a bankruptcy-remote entity, generally a trust.

Investment-grade: An indication of credit quality based upon JPMorgan Chase's internal risk assessment system. "Investment-grade" generally represents a risk profile similar to a rating of a "BBB-"/"Baa3" or better, as defined by independent rating agencies.

Managed basis: A non-GAAP presentation of financial results that includes reclassifications related to credit card securitizations and to present revenue on a fully taxable-equivalent basis. Management uses this non-GAAP financial measure at the segment level, because it believes this provides information to enable investors to understand the underlying operational performance and trends of the particular business segment and facilitates a comparison of the business segment with the performance of competitors.

Managed credit card receivables: Refers to credit card receivables on the Firm's Consolidated Balance Sheets plus credit card receivables that have been securitized.

Mark-to-market exposure: A measure, at a point in time, of the value of a derivative or foreign exchange contract in the open market. When the mark-to-market value is positive, it indicates the counterparty owes JPMorgan Chase and, therefore, creates a repayment risk for the Firm. When the mark-to-market value is negative, JPMorgan Chase owes the counterparty; in this situation, the Firm does not have repayment risk.

Master netting agreement: An agreement between two counterparties that have multiple derivative contracts with each other that provides for the net settlement of all contracts through a single payment, in a single currency, in the event of default on or termination of any one contract. See FIN 39.

Mortgage product types:

Alt-A

Alt-A loans are generally higher in credit quality than subprime loans but have characteristics that would disqualify the borrower from a traditional prime loan. Alt-A lending characteristics may include one or more of the following: (i) limited documentation; (ii) high combined-loan-to-value ("CLTV") ratio; (iii) loans secured by non-owner occupied properties; or (iv) debt-to-income ratio above normal limits. Perhaps the most important characteristic is limited documentation. A substantial proportion of traditional Alt-A loans are those where a borrower does not provide complete documentation of his or her assets or the amount or source of his or her income.

Option ARMs

The option ARM home loan product is an adjustable-rate mortgage loan that provides the borrower with the option each month to make

a fully amortizing, interest-only, or minimum payment. The minimum payment on an option ARM loan is based upon the interest rate charged during the introductory period. This introductory rate has usually been significantly below the fully indexed rate. The fully indexed rate is calculated using an index rate plus a margin. Once the introductory period ends, the contractual interest rate charged on the loan increases to the fully indexed rate and adjusts monthly to reflect movements in the index. The minimum payment is typically insufficient to cover interest accrued in the prior month, and any unpaid interest is deferred and added to the principal balance of the loan.

Prime
Prime mortgage loans generally have low default risk and are made to borrowers with good credit records and a monthly income that is at least three to four times greater than their monthly housing expense (mortgage payments plus taxes and other debt payments). These borrowers provide full documentation and generally have reliable payment histories.

Subprime
Subprime loans are designed for customers with one or more high risk characteristics, including but not limited to: (i) unreliable or poor payment histories; (ii) high loan-to-value ("LTV") ratio of greater than 80% (without borrower-paid mortgage insurance); (iii) high debt-to-income ratio; (iv) the occupancy type for the loan is other than the borrower's primary residence; or (v) a history of delinquencies or late payments on the loan.

MSR risk management revenue: Includes changes in MSR asset fair value due to inputs or assumptions in model and derivative valuation adjustments.

Material legal proceedings: Refers to certain specific litigation originally discussed in the section "Legal Proceedings" in the Firm's Annual Report on Form 10-K for the year ended December 31, 2002. Of such legal proceedings, some lawsuits related to Enron and the IPO allocation allegations remain outstanding as of the date of this Annual Report, as discussed in Part I, Item 3, legal proceedings in the Firm's Annual Report on Form 10-K for the year ended December 31, 2008, to which reference is hereby made; other such legal proceedings have been resolved.

NA: Data is not applicable or available for the period presented.

Net yield on interest-earning assets: The average rate for interest-earning assets less the average rate paid for all sources of funds.

NM: Not meaningful.

Nonconforming mortgage loans: Mortgage loans that do not meet the requirements for sale to U.S. government agencies and U.S. government sponsored enterprises. These requirements include limits on loan-to-value ratios, loan terms, loan amounts, down payments, borrower creditworthiness and other requirements.

OPEB: Other postretirement employee benefits.

Overhead ratio: Noninterest expense as a percentage of total net revenue.

Personal bankers: Retail branch office personnel who acquire, retain and expand new and existing customer relationships by assessing customer needs and recommending and selling appropriate banking products and services.

Portfolio activity: Describes changes to the risk profile of existing lending-related exposures and their impact on the allowance for credit losses from changes in customer profiles and inputs used to estimate the allowances.

Principal transactions: Realized and unrealized gains and losses from trading activities (including physical commodities inventories that are accounted for at the lower of cost or fair value) and changes in fair value associated with financial instruments held by the Investment Bank for which the SFAS 159 fair value option was elected. Principal transactions revenue also include private equity gains and losses.

Purchased credit-impaired loans: Acquired loans deemed to be credit-impaired under SOP 03-3. SOP 03-3 allows purchasers to aggregate credit-impaired loans acquired in the same fiscal quarter into one or more pools, provided that the loans have common risk characteristics (e.g., FICO score, geographic location). A pool is then accounted for as a single asset with a single composite interest rate and an aggregate expectation of cash flows. Wholesale loans were determined to be credit-impaired if they met the definition of an impaired loan under SFAS 114 at the acquisition date. Consumer loans are determined to be purchased credit-impaired based upon specific risk characteristics of the loan, including product type, loan-to-value ratios, FICO scores, and past due status.

Receivables from customers: Primarily represents margin loans to prime and retail brokerage customers which are included in accrued interest and accounts receivable on the Consolidated Balance Sheets for the wholesale lines of business.

REMIC: Investment vehicles that hold commercial and residential mortgages in trust and issues securities representing an undivided interest in these mortgages. A REMIC, which can be a corporation, trust, association, or partnership, assembles mortgages into pools and issues pass-through certificates, multiclass bonds similar to a collateralized mortgage obligation ("CMO") or other securities to investors in the secondary mortgage market.

Reported basis: Financial statements prepared under accounting principles generally accepted in the United States of America ("U.S. GAAP"). The reported basis includes the impact of credit card securitizations but excludes the impact of taxable-equivalent adjustments.

Return on common equity less goodwill: Represents net income applicable to common stock divided by total average common equity (net of goodwill). The Firm uses return on common equity less goodwill, a non-GAAP financial measure, to evaluate the operating performance of the Firm. The Firm also utilizes this measure to facilitate operating comparisons to other competitors.

Risk layered loans: Loans with multiple high risk elements.

Glossary of terms

SAB: Staff Accounting Bulletin.

SAB 105: "Application of Accounting Principles to Loan Commitments."

SAB 109: "Written Loan Commitments Recorded at Fair Value Through Earnings."

Sales specialists: Retail branch office personnel who specialize in the marketing of a single product, including mortgages, investments, and business banking, by partnering with the personal bankers.

SFAS: Statement of Financial Accounting Standards.

SFAS 5: "Accounting for Contingencies."

SFAS 13: "Accounting for Leases."

SFAS 52: "Foreign Currency Translation."

SFAS 87: "Employers' Accounting for Pensions."

JPMorgan Chase & Co. (NYSE: JPM) is a leading global financial services firm with assets of $2.0 trillion and operations in more than 60 countries. The firm is a leader in investment banking, financial services for consumers, small business and commercial banking, financial transaction processing, asset management and private equity. A component of the Dow Jones Industrial Average, JPMorgan Chase serves millions of consumers in the United States and many of the world's most prominent corporate, institutional and government clients under its J.P. Morgan and Chase brands.

Information about J.P. Morgan capabilities can be found at www.jpmorgan.com and about Chase capabilities at www.chase.com. Information about the firm is available at www.jpmorganchase.com.

At JPMorgan Chase, we're focused on doing our part to lead the way forward during these difficult times.

While we continue to face challenges in the financial systems in the United States and around the world, we maintain a fortress balance sheet and are well-positioned for the future.

We are confident that we will continue to reinvest in our businesses for the benefit of our stakeholders, as we do the right thing for our customers and for the communities we serve.

AND WE ARE COMMITTED TO STAYING THE COURSE:

- By continuing to lend to creditworthy businesses of all sizes – including state and local governments, healthcare companies, universities and not-for-profits – to help them create jobs, fund medical research, and improve social services and job training.
- By helping struggling homeowners stay in their homes by opening additional loan-counseling centers and by offering mortgage modifications.
- By promoting responsible management of personal finances through innovative services, like Chase Blueprint, and more customer-friendly practices, like our new overdraft policy.
- By maintaining strong capital levels and always following responsible business practices.
- By continuing to provide grants to thousands of not-for-profit organizations around the world through the JPMorgan Chase Foundation.

As we move forward, JPMorgan Chase remains a long-term optimist about our future and our country. We have a strong platform for progress, and we look forward to working with our customers and our stakeholders to seize the opportunities that lie ahead of us.

Dear Fellow Shareholders,

The past two years have been among the most extraordinary and challenging in recent history for JPMorgan Chase, the financial services industry and the global economy. We have endured a once-in-a-generation economic, political and social storm, the impact of which will continue to be felt for years or even decades to come. As we see signs of recovery and the debates about financial reform wage on, it's easy for us to forget the fear and panic we felt a year ago. The market was down an astonishing 50% from its 2008 highs to its low on March 9, 2009. More important, as I write this letter, our country has lost 8.4 million jobs in what has turned out to be a more serious, sustained economic crisis than most of us have ever experienced before — or may experience again.

For JPMorgan Chase, these past two years have been part of a challenging, yet defining, decade. We began it as three separate companies: Bank One, Chase and J.P. Morgan, with each facing serious strategic and competitive challenges. Today, our strategic position is clear, and JPMorgan Chase is a leader in all of its businesses. If you had been a Bank One shareholder from 2000 to year-end 2009 (this represents approximately 40% of the current company) and you held on to your stock, you would have received a total return on your investment of 131%. Over the same time period, if you were a Chase or J.P. Morgan shareholder, your returns would have been 12% and 70%, respectively. By comparison, the Standard & Poor's 500 Index was down 9% over the same period.

Throughout this decade, we made and executed on many transformative decisions. When the global financial crisis unfolded in 2008, the people of JPMorgan Chase understood the vital role our firm needed to play and felt a deep responsibility to our many stakeholders. It is this sense of responsibility that enables us to move beyond the distractions of the moment and stay focused on what really matters: taking care of our clients, helping the communities in which we operate and protecting our company.

It is because of this focus — even amid the daunting and ongoing challenges — that we are able to weather this economic crisis and continue to play a central, if sometimes misunderstood, role in rebuilding the U.S. economy. This is a testimony to the collective strength of character and commitment of our people. Since those first chaotic days in early 2008, many of our people have worked around the clock, seven days a week, for months on end.

Jamie Dimon,
Chairman and
Chief Executive Officer

On March 16, 2008, we announced our acquisition of Bear Stearns at the request of the U.S. government; on September 25, 2008, 10 days after the collapse of Lehman Brothers, we bought Washington Mutual. We loaned $70 billion in the global interbank market when it was needed the most. With markets in complete turmoil, we were the only bank willing to commit to lend $4 billion to the state of California, $2 billion to the state of New Jersey and $1 billion to the state of Illinois. Additionally – and, frequently, when no one else would – we loaned or raised for our clients $1.3 trillion, providing more than $100 billion to local governments, municipalities, schools, hospitals and not-for-profits over the course of 2009.

Our industry and our country are continuing to face some serious challenges, but we believe that the strengths of our nation – our resiliency, ability to reform and innovate, work ethic and culture – will put us on the right track again to global financial soundness. JPMorgan Chase will remain focused, and we will continue doing our part.

In the following sections of this letter, I'll talk about a range of issues that bear on our company, our industry and our country:

I. How our company fared in 2009 – with a focus on what we *actually* do as a bank to serve our clients and customers and what we did to respond to the crisis and help the communities in which we operate
II. How we manage our people – JPMorgan Chase's most valuable asset
III. Our support of financial reform that will strengthen the financial system
IV. Our responsibility and America's success

Overall results – performance improved from 2008 but still was not great

Our revenue this year was a record $100 billion, up from $67 billion in 2008. The large increase in revenue was due primarily to the inclusion for the full year of Washington Mutual (WaMu) and the dramatic turnaround in revenue in our Investment Bank. Profits were $12 billion, up from $6 billion in the prior year but down from $15 billion in the year before that. While these results represent a large improvement over 2008, they still are an inadequate return on capital – a return on tangible equity of only 10%. Relative to our competition, our company fared extremely well. We did not suffer a loss in any single quarter over the two-year crisis (we may have been one of the few major global financial firms to achieve this). In absolute financial terms, however, our results were mediocre.

Maintaining our fortress balance sheet and commenting on our dividend

During this difficult year, the strategic imperatives that have defined and distinguished our company continued to serve us well. We maintained our focus on risk management; high-quality capital; strong loan loss reserves; honest, transparent reporting; and appropriately conservative accounting. We maintained an extremely strong Tier 1 Common ratio, which stood at 8.8% at year-end. We also increased our loan loss reserves over the course of the year from $23.2 billion to $31.6 billion, an extremely strong 5.5% of total loans outstanding. Our relentless focus on our balance sheet has always enabled us to prevail through tough times and seize opportunities while continuing to invest in our businesses. It served us extremely well over this period.

Early in 2009, we cut our annual dividend from $1.52 to $0.20 per share – a drastic move premised on the need to be prepared for a prolonged and potentially terrible economy. We hope to be able to increase the dividend to an annual range of $0.75 to $1.00 per share. To do so, we would like to see three specific things happen: several months of actual improvement in U.S. employment; a significant reduction in consumer charge-offs (which improves earnings and diminishes the need for additional loan loss reserves); and more certainty around the regulatory requirements for bank capital levels. Possible changes in capital and liquidity requirements as well as some tax proposals are creating uncertainty around our future capital needs. We hope there will be more clarity regarding these issues soon.

Many companies had to measurably dilute their shareholders because of this crisis. We did not. The only time we issued a material amount of stock was when we did it offensively to finance the WaMu purchase (and maintain our very high capital ratios). We also hope to be in a position to resume stock buybacks in the near future. But our first priority is – and always has been – to invest our capital to grow our businesses organically and, secondarily, to make valuable acquisitions. We buy back stock only when we think it is a good value for our shareholders relative to the value of other opportunities. And if we use our stock in an acquisition, we do so because we believe the value we're getting is at least equal to the value we're giving.

Increasing our efficiency

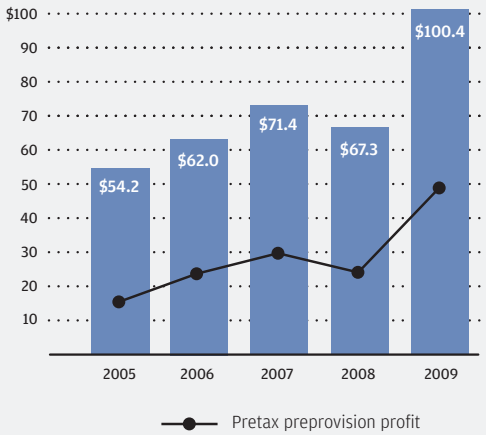
Overall, we are a far more efficient company than we were five years ago, following the JPMorgan Chase-Bank One merger. Since then, we've consolidated virtually all of our operating platforms, networks and data centers, and we have excellent technology and best-in-class financial and risk systems. We also have exceptional legal, finance, compliance, risk, human resources and audit staff. Today,

the cost of this improved level of operation and service per dollar of revenue is significantly lower than in the past. To give just one example, our total technology and operations and corporate overhead costs would be more than $9 billion higher today if they were running at the same cost per dollar of revenue as in 2005.

Continuing to invest

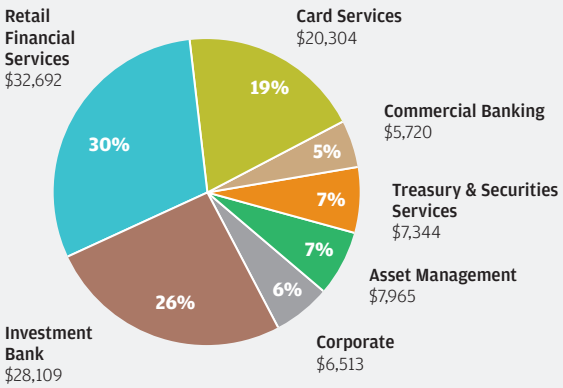
Through the worst of the past two years, we never stopped investing. This has included acquisitions, foremost among them Bear Stearns and Washington Mutual; investments in infrastructure, including systems and technology; new products, for example in Card Services; and the addition of bankers and branches around the world. These investments set us up for continued organic growth.

Preparing for tougher global competition



The competitive landscape is rapidly changing. Many companies did not make it or had to be dramatically restructured. We expect this trend to continue in both the United States and Europe. We and others who survived benefited from market share gains (in fact, we gained market share in virtually all of our businesses). But we must be prepared for all of our competitors to come roaring back. With certain competitors and in certain parts of the world, this already is happening. We do not take this lightly.

Protecting the company in uncertain times



You read about it every day: continued global trade imbalances, higher fiscal deficits run by governments around the world, uncertain interest rate movements and potential regulatory changes, among other issues. I could go on for pages. Rest assured, we are paying very close attention to the difficult issues we still face.

Following is a recap of our line of business results. In this section, I will focus on describing what we as a bank *actually* do, which seems to be so often misunderstood. As you read these results, I hope you will feel as I do – that we have excellent franchises, focused on doing a great job for our customers (even though we do make mistakes), and that we have been continuously and deliberately investing for future growth.

Net revenue

Results by line of business: Great leadership amid great challenges

The Investment Bank reported net income of $6.9 billion with an ROE of 21%

Overall results

The Investment Bank (IB) delivered record performance across the board: net income of $6.9 billion on revenue of $28.1 billion. These results were led by best-ever Global Markets revenue of $22 billion and record investment banking fees of $7.2 billion. The IB generated a return on equity of 21% on $33 billion of allocated capital, our best result in five years. We clearly benefited from higher bid-offer spreads and higher volumes as the industry consolidated and vulnerable companies were distracted. In terms of market share, we achieved a #1 ranking in every major global capital-raising league table category. We do not, however, take this position for granted and understand that maintaining and growing our market share will undoubtedly be tough going forward. We believe our success was due to the dedication of our 25,000 employees, who were working hard to serve our clients every day.

What we do in Corporate Finance

Globally, we have more than 2,000 investment bankers, who serve the corporate finance needs of 5,000 institutions around the world. More than 1,000 of these clients are sovereign governments, state and municipal governments, international quasi-government agencies, hospitals, schools and not-for-profits; the others are generally corporations and financial institutions. Our job is to help these clients find appropriate financing, make strategic acquisitions or divestitures, and help manage their balance sheets and other exposures – such as exposure to interest rates, foreign exchange or commodity prices.

In 2009, among their many activities, our investment bankers:

- Advised on 322 mergers and acquisitions globally – more than any other bank.
- Loaned or syndicated loans of more than $200 billion to 295 companies, helping them grow and create jobs.
- Raised $620 billion of equity or bonds in public markets for clients around the world.
- Raised $178 billion for the financial industry, or nearly 10% of the capital needed to rebuild the financial system.
- Raised $102 billion for states, municipalities, hospitals, schools and not-for-profits – to help build roads and bridges, improve social services, renovate local hospitals and train people for employment. This financing included $19 billion to educational organizations and $14 billion to healthcare organizations.
- Committed to provide financing when others were not able to do so; for example:
  – $4 billion to California;
  – $2 billion to New Jersey; and
  – $1 billion to Illinois.
- Arranged $60 billion to restructure stressed companies and help them recover (and keep their employees at work).
- Invested in 58 U.S. wind farms spread across 16 states. This portfolio can produce 5,843 megawatts of capacity – enough energy to power some 1.6 million U.S. homes. We also are a leader in sourcing, developing and trading emission-reduction credits, primarily through our investments in ClimateCare and EcoSecurities.

In difficult times, extending this level and type of credit is exceedingly risky and costly. For example, in 2008 and 2009, we wrote off or reserved for approximately $8.9 billion of credit-related losses related to IB lending activities.

Key earnings metrics

(in millions, except for ratio and per share data)

	2005	2006	2007	2008	2009
Investment Bank	$ 3,673	$ 3,674	$ 3,139	$ (1,175)	$ 6,899

What we do in Sales and Trading

Trading is perhaps the least understood area of our investment banking activities. We have 6,500 professionals on approximately 120 trading desks in 25 trading centers around the world; these professionals include more than 800 research analysts who educate investors on nearly 4,000 companies and provide insight on 40 developed and emerging markets. The job of our sales and trading professionals is to provide 16,000 investor clients globally with research expertise, advice and execution capabilities to help them buy and sell securities and other financial instruments. These investors range from state and municipal pension plans to corporations and governments. We have experienced specialists who are prepared to buy or sell large amounts of stocks and bonds, foreign currencies or commodities for clients and to give them immediate cash or liquidity when they need it – something we *never stopped* doing even at the most trying moments of the financial crisis. Additionally, we help organizations manage and hedge their risk through providing a range of derivatives products.

Although we run our sales and trading business to support clients, it is a risky business. We execute approximately 2 million trades and buy and sell close to $2.5 trillion of cash and securities each day. On an average day, we own, for our account, approximately $440 billion in securities – to us this is akin to the inventory of a store. We hold the securities so we can meet client demand. Our sales and trading functions not only play a critical role in helping to maintain large, liquid and well-functioning markets, but they are indispensable to institutions of all types seeking to raise capital in the first place.

As more clients chose to work with us in 2009, our sales and trading teams gained market share. We estimate that our market share of the top 10 players in Fixed Income and Equity Markets combined grew from approximately 9% in 2008 to more than 12% in 2009. Deservedly, these groups also received a lot of accolades – most gratifyingly, from client-based surveys.

How we intend to grow

In 2010, we will continue to focus on the fundamentals of investment banking: advising companies and investors, raising capital, making markets and executing for our clients worldwide. If we do this well, we are helping not only our clients but the global economic recovery as well.

We also are aggressively and organically growing many parts of our business. For example, the Prime Services business we acquired from Bear Stearns – which provides mostly large investors with custody, financing

and trade execution – largely was concentrated in the United States. We now are growing this business in Europe and Asia. Across the business, we will continue to invest in enhancing our technology, spending $1 billion this year on upgrades and innovations. We also are expanding our coverage in key markets, including China, India and Brazil – essentially by adding investment banking and trading professionals and providing them with the corresponding support they need (i.e., credit and systems) to cover more corporate and investor clients in these markets. For example, in the last five years in India, we have gone from covering 36 companies to 180 companies. We will simply grow with the emerging economies.

Cazenove

At the end of 2009, we announced that our U.K. joint venture with Cazenove Group Limited would become a wholly owned part of J.P. Morgan. Our initial investment in Cazenove in 2005 was extremely successful – among other things, it increased our U.K. investment banking market share* from 5% to 13%. We welcome all of these employees to J.P. Morgan – Cazenove's long tradition of integrity and client service sets a standard for all of us.

Commodities

We continue to build out our Commodities franchise. Price fluctuations in commodities like oil, gas and electricity affect many companies throughout the world. We help our corporate clients manage this risk by enhancing our trading and warehousing capacity. Since 2006, our Commodities business has more than doubled its revenue from serving clients. In February 2010, we announced our agreement to purchase a portion of RBS Sempra's commodities business for $1.7 billion. This acquisition will give us the ability in Europe to trade oil, gas and electricity far more extensively than we can now; it will enhance all of our prior U.S. capabilities; and it will add a capability to warehouse metals for clients. It also will nearly double the number of corporate clients we serve in Commodities, to more than 2,000.

Retail Financial Services reported net income of $97 million with an ROE of 0%

Overall results

Retail Financial Services (RFS) continued to be a tale of two cities. Retail Banking, which includes Consumer and Business Banking, earned $3.9 billion, primarily by serving customers through bank branches in 23 states. Consumer Lending lost $3.8 billion because of continued high charge-offs in the home lending business.

In our fastest conversion ever, we upgraded 1,800 Washington Mutual branches and more than 40 million accounts to Chase's systems, products and branding. As a result of these conversions, customers today have full access to 5,154 Chase branches across the country (from New York and Florida to California). Former WaMu customers have received greater access to better systems and products, and we did it at greatly reduced cost to the firm (approximately $2 billion firmwide). We now have one of the most attractive franchises in the country, with enormous opportunities to grow.

What we do in Retail Banking

Last year, our 61,000 people in 5,154 Chase branches in 23 states served more than 30 million U.S. consumers and small businesses by providing checking and savings accounts and investments, as well as home, business, auto and student loans. For our RFS professionals, 2009 was a year of numerous accomplishments:

- Retail operations teams processed 700 million teller transactions, 3.5 billion debit card purchases, 100 million ATM deposits, close to 6 billion checks and more than 1.3 billion statements.
- Investment advisors oversaw $120 billion in assets under management to help consumers toward their goals.
- We added 4.2 million mobile banking customers and another 5.2 million new online banking customers.

* Market share as measured in total fees.

- We also added 2,400 branch sales staff last year – personal and business bankers, mortgage officers and investment representatives – to better serve our customers.

In addition, we are revamping our overdraft policies to meet regulatory requirements, to make them clearer and simpler, and to give customers more control. Customers now can choose if they want overdraft services for their debit cards, and they will have a real-time ability to see their balances over the course of the day. These changes are ongoing and complex. We hope to complete them with minimal disruption and maximum consumer satisfaction. While costly (we estimate these changes will reduce our after-tax income by approximately $500 million annually), we believe these moves will strengthen our long-term relationship with our customers.

What we do in Small Business Banking

In 2009, our nearly 2,000 business bankers provided approximately $2.3 billion in new loans (our total outstanding loans are $17 billion) and other services to help 2 million business owners nationwide manage their businesses. Loan origination in 2009 was down 58%, as customer demand decreased significantly and our underwriting standards became more disciplined. We expect a substantial turnaround in 2010, and, in fact, we already are seeing increased demand from more qualified customers.

We are renewing our efforts to get more credit into the marketplace, including adding 375 small business bankers to our current workforce. In late 2009, we committed to boosting lending to small businesses by $4 billion in 2010 (to a total of $10 billion) through increased access to working capital, term loans for expansion, commercial mortgages, lines of credit and business credit cards.

What we do in Consumer Lending

Our Consumer Lending business includes home and auto loans for consumers. In terms of overall results, it was another difficult year for Consumer Lending, with losses of $3.8 billion, driven by increased charge-offs and additions to loan loss reserves in our home lending portfolios. As discussed last year, these losses were the result of departures from our traditional (and well-tested) underwriting standards, sharply falling home prices and the deepening recession. While there has been some improvement in delinquencies and home prices in some markets, we believe that significant improvement will depend largely on an improving economy.

As expected, charge-offs in Home Lending continued to rise during 2009, and we added $5.2 billion in reserves to our portfolio. We anticipate that this portfolio will continue to lose money for the next three years (excluding reserve changes) as we work through a backlog of problem loans. The losses come not only from charge-offs but from the costs of managing delinquencies and foreclosures (though we were able to reduce the number of homes that we own from 12,700 in 2008 to 7,400 in 2009).

More positively, we took a leadership role in helping American homeowners through the most difficult housing market of a generation. We added 6,000 people just to help homeowners through modification programs and other actions to prevent foreclosure. We also opened 34 Chase Homeownership Centers to allow struggling borrowers to talk with loan counselors face to face and have begun opening 17 more in early 2010. These efforts have allowed us to begin the mortgage modification process for nearly 600,000 homeowners (approximately one-third of which are modifications under the government's new Home Affordable Modification Program, or HAMP).

The mortgage business essentially has returned to the more disciplined underwriting of many years ago: 80% loan-to-value ratios and income verification. In 2009, we originated more than $150 billion in new home

loans, much of it refinancing that allowed homeowners to lower their payments by taking advantage of historically low interest rates. Most of the loans that we originate are sold to Fannie Mae, Freddie Mac or Ginnie Mae. We still underwrite jumbo loans (those with loan amounts larger than those permitted in government programs), but we have been very cautious. The home lending business will one day return to being a good business – it certainly is critical to the proper functioning of America's financial markets – and we intend to be a leader in it.

In 2009, we also became the largest U.S. auto lender, financing more than 1.1 million auto loans for consumers, up 25% from 2008. Our auto loans outstanding totaled $46 billion at the end of 2009.

How we intend to grow

To provide better service to our millions of customers, we plan to *add* 2,700 personal bankers and more than 400 investment sales representatives in 2010. These efforts should help us earn new customers and broaden our relationships with existing customers beyond checking accounts and other basic services. In addition, we expect to open at least 120 more branches in 2010 and to ramp up our pace of openings in 2011 and 2012 – especially in California and Florida, two of the fastest-growing U.S. markets, which were introduced to us through the WaMu acquisition.

Card Services reported a net loss of $2.2 billion

Overall results

By all measures, 2009 was a terrible year for our credit card business. The economic environment drove charge-off rates to all-time highs. Card Services lost $2.2 billion (compared with last year's profit of $780 million). While I don't want to diminish the negative overall results, there were some positives. We were able to grow market share in terms of accounts and customer spending; and our credit loss performance – 8.5% on Chase cards – while poor, was better than our competitors' performance.

What we do in Card Services

Our 23,000 Card Services employees around the world provide financial flexibility and convenience to customers who, in 2009, used Chase credit cards to meet more than $328 billion of their spending needs. With more than 145 million cards in circulation held by approximately 50 million customers with $163.4 billion in loan outstandings, Chase is among the largest U.S. card issuers, with a wide variety of general purpose credit cards for individual consumers and small businesses. We also issue cards with a number of partner organizations, such as the American Association of Retired Persons (AARP), Continental Airlines, Marriott, Southwest Airlines, United Airlines and Walt Disney.

How we dealt with new regulation

In 2009, in addition to the terrible environment, the U.S. credit card business faced fairly dramatic changes because of a new law enacted by Congress in May. The new law restricts issuers' ability to change rates and prohibits certain practices that were not considered consumer-friendly. These changes alone are expected to reduce our after-tax income by approximately $500 million to $750 million – but this could possibly change as both consumers and competitors change their behavior.

We believe that many, but not all, of the changes made were completely appropriate. In fact, we had voluntarily eliminated certain of the targeted practices – like double-cycle billing, which resulted in greater interest charges for customers who revolve a balance for the first time (2007); and universal default pricing, in which creditors consider credit histories with other lenders in setting rates (2008). However, because the new law makes it harder to raise rates on customers who have become far riskier and because all payments now must go toward reducing users' highest-rate balances (vs. lower-rate balances), we and other competitors have had to make some fairly drastic changes in the business:

- We have substantially reduced very low introductory or promotional balance transfers. This change alone reduced our outstanding balances by $20 billion.
- In the future, we no longer will be offering credit cards to approximately 15% of the customers to whom we currently offer them. This is mostly because we deem them too risky in light of new regulations restricting our ability to make adjustments over time as the client's risk profile changes.
- We reduced limits on credit lines, and we canceled credit cards for customers who had not done business with us over an extended period.

In fact, the industry as a whole reduced limits from a peak of $4.7 trillion to $3.3 trillion. While we believe this was proper action to protect both consumers and card issuers, doing so in the midst of a recession did reduce a source of liquidity for some people. Ultimately, however, the change may make the card business a more stable and better business.

How we intend to grow

Aggressive product innovation is fundamental to the development of the credit card business. Even through the recent tumultuous times, we never stopped investing in new products and services to meet our customers' needs. In 2009, Chase launched more products at one time than any other issuer. New products and services included two Chase-branded card programs, a rewards platform, and a new feature to help better manage spending and borrowing. Here are some of the highlights:

- The Chase Sapphire℠ card was developed from the ground up to address the needs of affluent consumers, with premium rewards and exceptional service.
- Ink℠ from Chase is a suite of business cards offering flexible payment options and resources for small business owners.
- Our new Ultimate Rewards℠ program offers countless redemption options through a single website: www.ultimaterewards.com.
- Blueprint℠ is an industry-first set of features to improve the way Chase customers manage their spending and borrowing, with tools to help consumers take charge of their finances, pay down balances and manage spending.

These new products* and programs would be considered major innovations at any time; but the fact that we launched them in one of the worst-ever U.S. consumer environments is especially noteworthy. By delivering convenience, customization and great service, we will build stronger customer relationships. Even as the credit card business has seen more than its share of difficulties during the past year, we believe our new products will help us rebuild trust with our customers. It's a process that will take time, but if we focus on delivering useful products and making financing easier for our customers, Card Services will return to being a business that is good for our customers and profitable for our company.

* If you would like to review any of our new products, go to our website: www.chase.com.

Commercial Banking reported net income of $1.3 billion with an ROE of 16%

Overall results

In 2009, Commercial Banking overcame many challenges to deliver exceptional financial performance. Even as substantially higher credit costs negatively affected quarterly results, the business exceeded its annual plan by focusing on client selection, marketing its business aggressively, managing risks and expenses, and excelling in client service. Highlights included a 20% boost in revenue to $5.7 billion; a 25% improvement in operating margin to $3.5 billion; double-digit increases in both average liability balances, up 10%, and average loan balances, up 30%; and a 20% jump in gross investment banking revenue to $1.2 billion – a full 25% above plan. These were *fabulous* results in any environment.

What we do in Commercial Banking

More than 1,400 bankers help fulfill the financing needs of nearly 25,000 clients and over 30,000 real estate investors and owners. The average length of a Commercial Banking client relationship with us is more than 18 years. In 2009, we added over 1,700 new Commercial Banking clients and expanded more than 7,600 relationships. With a team of banking, treasury and client service professionals situated in local markets coast to coast and around the world, Commercial Banking delivers financial services while steadfastly supporting communities. Last year, Commercial Banking extended more than $73 billion in new financing, which included nearly $8 billion to the government, not-for-profit and healthcare (GNPH) and education sectors. For example:

- We helped finance the construction of a $22.3 million healthcare center in the Bronx, New York, to serve an additional 18,000 patients per year.
- As part of more than $384 million in new and renewed commitments to GNPH and educational entities in Ohio, we provided Kent State University with needed financing.
- We assisted Children's Memorial Hospital in Chicago in financing the construction of a new $915 million building with a $196 million credit facility.

How we intend to grow

Having successfully completed the conversion of commercial client accounts acquired through Washington Mutual, Commercial Banking is well-positioned to grow. The business already is taking advantage of Chase's retail branch network to expand its offerings into five new states – California, Washington, Oregon, Georgia and Florida. We'll now cover these new markets by supporting a full range of clients, from middle market companies to large corporations. We are achieving this by hiring exceptional commercial bankers – more than 50 employees by the end of 2010 alone – to serve these additional markets. Several years from now, when this expansion ultimately is completed, we expect it will generate hundreds of millions of dollars in additional profits annually.

On another front, when JPMorgan Chase and Bank One merged, we set a target of more than $1 billion in revenue from investment banking products sold to Commercial Banking clients (up from $552 million). This year, we exceeded the goal and are poised to continue growing this business.

Treasury & Securities Services reported net income of $1.2 billion with an ROE of 25%

Overall results

Treasury & Securities Services (TSS) delivered solid but lower results, producing 2009 profits of $1.2 billion vs. $1.8 billion in the prior year. The business delivered net revenue of $7.3 billion, down 10% from the previous year. We describe TSS as our "Warren Buffett-style" business because it grows with our clients and with inflation; delivers excellent margins and high returns on capital; and is hard for would-be competitors to replicate because of its global scale, long-term client relationships and complex technology.

Our 2009 performance largely was driven by weakened market conditions and lower interest rates. Securities lending and foreign exchange volumes and spreads, in particular, saw significant declines. TSS also saw deposits level off after an exceptional period in late 2008 and early 2009, when we were a huge beneficiary of the markets' flight to quality. Despite the headwinds of 2009, the underlying business drivers remained strong: International electronic funds transfer volumes grew 13%, assets under custody increased 13% and the number of wholesale cards issued grew 19%.

What we do in Treasury & Securities Services

More than 6,000 TSS bankers serve more than 40,000 clients from all of our other lines of business in 60 locations around the world. TSS provides clients with critical products and services, including global custody in more than 90 global markets, holding nearly $15 trillion in assets; corporate cash management, moving an astounding $10 trillion a day of cash transactions around the world for clients; corporate card services, providing 27 million cards to more than 5,000 corporate clients and government agencies; and trade services, guaranteeing international payments for our clients, who are many of the world's largest global companies. Following are some specific examples of how TSS supports a range of clients:

- We delivered unemployment and other benefits to more than 12 million individuals in 2009, as the national leader in bringing electronic banking services to low-income households through electronic benefits transfer and debit and stored-value cards.
- We were selected by the Federal Reserve to serve as custodian for its program to purchase up to $1.25 trillion in mortgage-backed securities in order to provide support to the mortgage and housing markets.
- We are the leading cash management provider to the U.S. Postal Service, providing cash and check depository services to nearly one-third of the U.S. Postal Service's 80 districts.

How we intend to grow

TSS essentially grows by following its clients around the world, which means opening new branches and constantly improving products. In 2009, TSS opened new branches in China, Denmark, Finland, Norway and Sweden; launched new services in Tokyo, South Korea, Brazil and Mexico; and expanded capabilities in Australia, India, Europe, the Middle East and Africa. We will continue this expansion for the foreseeable future.

In addition, more than three years ago, TSS and the Investment Bank formed a joint venture to create our Global Corporate Bank. With a team of more than 100 corporate bankers, the Global Corporate Bank serves multinational clients by giving them access to TSS products and services and certain IB products, including derivatives, foreign exchange and debt. We intend to expand the Global Corporate Bank aggressively over the next several years by opening 20-30 locations and adding 150 corporate bankers, allowing us to cover approximately 1,000 new clients (3,100 total, up from 2,100).

Asset Management reported net income of $1.4 billion with an ROE of 20%

Overall results

Asset Management, with assets under supervision of $1.7 trillion, saw earnings increase by 5% in a year that began with strong negative headwinds and finished with a market rally. Overall, the year's results reflected several trends, including strong investment performance, continued growth in Private Banking, excellent investment performance from Highbridge Capital Management and a breakout year for our U.S. retail mutual funds business. All of these trends reflected an improving story from the challenges of the past two years.

What we do in Asset Management

Our Asset Management franchise consists of two primary businesses. The first is Investment Management, in which 6,500 employees help institutions and retail investors worldwide manage their cash; provide equity, fixed income and alternative investment strategies; and administer 401(k) services for large and mid-size U.S. employers. Overall, we manage more than $1.2 trillion in assets for our clients.

Our second primary business is Private Banking. Our 1,900 private bankers help the world's wealthiest individuals and families grow, manage and sustain their wealth with investing, portfolio structuring, capital advisory, philanthropy and banking services.

Throughout 2009, our Asset Management professionals advised institutions on how to strengthen pension plans for the benefit of their employees; advised more than 1.6 million 401(k) participants on achieving a secure retirement; executed comprehensive financial plans for family enterprises and business owners; distributed more than $100 million to charities on behalf of fiduciary clients; and brought market insight and top-performing products to financial advisors who guide millions of individual investors worldwide.

Within Asset Management, our Fixed Income group solidified its position as the #1 provider of global liquidity (we manage $590 billion), and our U.S. Equity platform had 82% of assets under management in the top two quartiles of peer fund group investment performance over five years. Our U.S. retail business had an exceptional year despite clients' broadly based risk aversion, bringing in record net asset flows and ranking third in net new long-term flows in the industry – due principally to the sale of strong-performing fixed income products.

Private Banking experienced record revenue due to inflows from clients and solid investing, lending and banking activity, as well as the addition of nearly 100 client advisors and five new Private Wealth Management offices (in Miami, Philadelphia, San Francisco, Seattle and Washington, D.C.).

In mid-2009, J.P. Morgan assumed 100% ownership of Highbridge Capital Management, one of the largest alternative asset managers in the United States, with $21 billion in client assets. We acquired Highbridge in 2004 to augment our alternative investment offerings for clients. Highbridge delivered the best investment performance in its history in 2009, and just five years into our partnership, its assets have grown threefold.

Importantly, rigorous risk management enabled Asset Management to provide valuable support to our clients and avoid many of the negative developments that surfaced during the financial crisis and damaged an untold number of investors.

How we intend to grow

Our Investment Management business is developing new global strategies, including funds focused on maritime investments, commodities, distressed debt and China. We also plan to enhance Investment Management's global distribution with the addition of more than 200 employees and increased budgets for marketing and client outreach.

In 2010, we plan to expand Private Banking globally by adding more than 500 bankers, investors and client service employees. In addition, we intend to continue to invest in the growth of the brokerage business we acquired from Bear Stearns. We anticipate a slowly improving but volatile investment environment in 2010 – yet, nonetheless, we expect Asset Management to continue to thrive by helping millions of individuals, families and institutions achieve their financial goals.

The Corporate sector reported net income of $3.7 billion

Our Corporate sector, excluding merger-related items, produced net income of $3.7 billion compared with $768 million in the prior year. The Corporate sector comprises three segments: Private Equity, unallocated corporate expenses and our corporate investment portfolio. Our Private Equity segment reported a net loss of $78 million vs. a net loss of $690 million in 2008. Remember, however, in 2007, we had an outstanding year with pretax Private Equity gains of more than $4 billion. We know that Private Equity returns, by their nature, are lumpy, but we expect to average 20% returns over the years.

Our corporate investment portfolio, which we own in order to manage excess cash, our collateral needs and interest rate exposure, grew from a low of $91 billion in March 2008 to an average of $324 billion in 2009. Our investment portfolio produced exceptional performance, the result of both managing interest rate exposures and buying securities that we thought were extremely safe investments and were trading at large discounts to fair value (e.g., mortgage ABS, Triple-A credit card ABS and Triple-A CLOs). The pretax unrealized gain of this portfolio went from a loss of $3.4 billion at the beginning of 2009 to a gain of $3.3 billion at year-end. It's important to note that your company manages its interest rate exposure extremely carefully and believes that taking this exposure is fundamentally not how we make our money. Any investor can take on interest rate exposure – we do not consider that a business. We do not borrow "cheap" from the Federal Reserve or any other source; we borrow at market rates, like everyone else does.

We may realize some of these Corporate investment gains in 2010, but we do not expect these exceptional results to continue. Over the course of the year, Corporate quarterly net income (excluding Private Equity, merger-related items and any significant nonrecurring items) is expected to decline to approximately $300 million.

II. HOW WE MANAGE OUR PEOPLE – JPMORGAN CHASE'S MOST VALUABLE ASSET

Nothing is more vital to the long-term growth of JPMorgan Chase than our ability to attract and retain talented and dedicated employees. Ours is a complicated business. Managing it requires complex systems, extensive quantitative skills and risk discipline. The pressure can be enormous and wide-ranging – from a trader dealing with large positions to a call center employee helping a customer modify a mortgage loan that no longer is affordable. Being smart is not enough; it also takes a high level of social intelligence and skill to handle all types of customers facing all kinds of challenging circumstances.

Success at our firm requires that employees treat clients and customers respectfully and fairly and stay true to the values embedded in our culture: personal commitment, honesty, teamwork, diversity and community awareness.

Ensuring we have the best people, training and leadership requires that we do many things right, from recruiting and training to recognizing, rewarding and developing leaders. This is what enables us to attract, retain and develop the best people.

Recruiting and training talent

The breadth, complexity and variety in the work our people do are impressive by any measure but are not well-understood. We have 220,000 employees around the world. While some of us have high-profile jobs and receive great attention – not always for the better these days – many others are not in the public eye. These individuals are essential to our global operations and include:

- Nineteen thousand programmers, application developers and information technology employees who tirelessly keep our 80 data centers, 55,000 servers, 225,000 desktops and global network up and running – and who were a major part of completing the Bear Stearns and WaMu conversions in record time.
- Eighty thousand employees fulfilling operations functions globally and thousands of customer service colleagues. In 2009, they responded to more than 245 million phone calls – to help customers stay in their homes, understand credit card payment plans and avoid financial problems during these difficult times.
- Thirteen thousand people in Legal & Compliance, Risk, Audit, Human Resources and Finance in 60 countries who rigorously analyze facts and figures, thoughtfully review the policies we have and address the issues we face. For example, we rely upon hundreds of credit risk officers to manage our various exposures, including $2 billion of new loans we make on average every day.
- Thousands more of our colleagues working behind the scenes to keep our operations safe and efficient, including mailroom attendants, mechanics and engineers, executive assistants, receptionists, security personnel and those who manage our facilities worldwide.

To fill these jobs, we hire thousands of employees each year, all of whom must be trained in our products, services and procedures in order to do their jobs well. Annually, we hire 1,800 people with advanced degrees (including M.B.A.s and Ph.D.s). Thousands of our people have advanced degrees in math, science and physics. While many of these people work in the Investment Bank, others work in Asset Management, Credit and Risk Analysis, Consumer Lending and Treasury & Securities Services, as well as in data centers across the firm.

Employees of JPMorgan Chase receive ongoing training and development to ensure they are well-equipped to manage the complex systems, risk management disciplines and client relationships that are critical to our franchise. Additionally, many are prepared to assume managerial and leadership roles over time. Our company has 94 management develop-

ment programs and more than 20,000 training programs (including online courses) that enable our people to hone and expand their skills in a rapidly changing business.

Ongoing assessment and development

At JPMorgan Chase, we are fortunate to attract world-class talent. We owe it to our employees, our customers and our shareholders to create an environment in which our people can do their best work. Toward this end, we believe in assessing their strengths and weaknesses and regularly giving them honest and thorough feedback. Additionally, we know that in order to sustain our strong competitive position, we must focus on developing exceptional leaders. This starts with a clear and shared understanding about the attributes we value most in senior managers. These qualities must be intentionally fostered and reinforced through a rigorous talent assessment process. This process now is embedded as part of how we operate. We also are developing a general management program for M.B.A. students to help us add to our bench and build general management talent on an ongoing basis.

Encouraging mobility and multiple careers

Talent mobility and optimization are key to our long-term success. We have to clearly outline what people need to do to move to the next level at JPMorgan Chase. We are working to do away with statements such as, "My boss won't let me go ... or my boss won't let me look at positions in other divisions." People have the right to explore different career opportunities and follow their dreams. While it's also an individual's responsibility to manage his or her own career, it's our job to help facilitate that. We strive to be proactive and thoughtful in that regard.

Intense focus on succession

We need to be honest and thoughtful about potential successors, particularly for senior jobs. We have redoubled our efforts to ensure that we have people in the pipeline who are capable of assuming senior levels of responsibility three, five or even seven years out or right away if necessary (the "hit by a truck" emergency scenario). This is true for my job as well.

Poor CEO succession has destroyed many a company. CEO and management succession often seems more like a psychological drama or a Shakespearean tragedy than the reasoned and mature process it should be. It is in our best interest to avoid such drama.

I want to assure you, our shareholders, that your Board believes that we have within the organization some outstanding people who could do my job today; and we will continue to rotate some of our senior people across the business to ensure that others are fully developed to take my job in the future. The Board of Directors not only believes that this is a priority but that it is of the utmost importance. And you can rest assured that your Board members are on the case. They personally know all of the Operating Committee members of the company (and many others), and the Board members periodically review – with and without me – your company's key succession plans.

Getting compensation right

Compensation is one of the most complex issues we confront – it is important to our employees, our company, our shareholders and, increasingly, the public at large. A poorly conceived compensation strategy can devastate a company by attracting the wrong people and incenting them to do the wrong things for the wrong reasons. At JPMorgan Chase, we put a great deal of time and thought into designing compensation plans that attract and motivate good people and reward good behavior. Of course, compensation aside, we always expect our people to do the right thing. A badly designed compensation plan never is an excuse for bad behavior.

Many people are concerned and angry about compensation practices across the financial services industry – and many of these concerns are quite legitimate. Senior leaders at some companies made a great deal of

money while their companies failed and, in the process, helped contribute to the crisis in our country. This angers me, too. But not all companies were reckless – and not all companies had bad compensation practices.

In this section, I'm going to describe how our overall 2009 compensation related to other industries, present some overall principles that guide us and explain how we apply these principles in compensating our people.

Comparing JPMorgan Chase with other industries

In 2009, JPMorgan Chase's total expenses were $52 billion. The total compensation (salaries and benefits and incentives) your company paid out was $27 billion.

JPMorgan Chase compensation – 2009

	Total (in billions)	Average per employee (in thousands)
Salaries	$ 12.5	$ 56
Benefits*	3.9	18
Incentive compensation**	10.6	46
Total compensation and benefits***	$ 27.0	$ 120

As seen above, we paid salaries and benefits of approximately $74,000 per person and incentive compensation on average of $46,000 per person for a total of $120,000 per person. These salary and benefit numbers are generally in line with other major companies – financial and non-financial.

The incentive awards come in various forms (cash, commissions, restricted stock, options, etc.). Approximately 32% of the incentive compensation for 2009 was in restricted stock and options that vest over a number of years. At JPMorgan Chase, the use of stock options is very restricted – we only use stock options for approximately 500 people a year – and represents just 1%-2% of the company's total compensation expense.

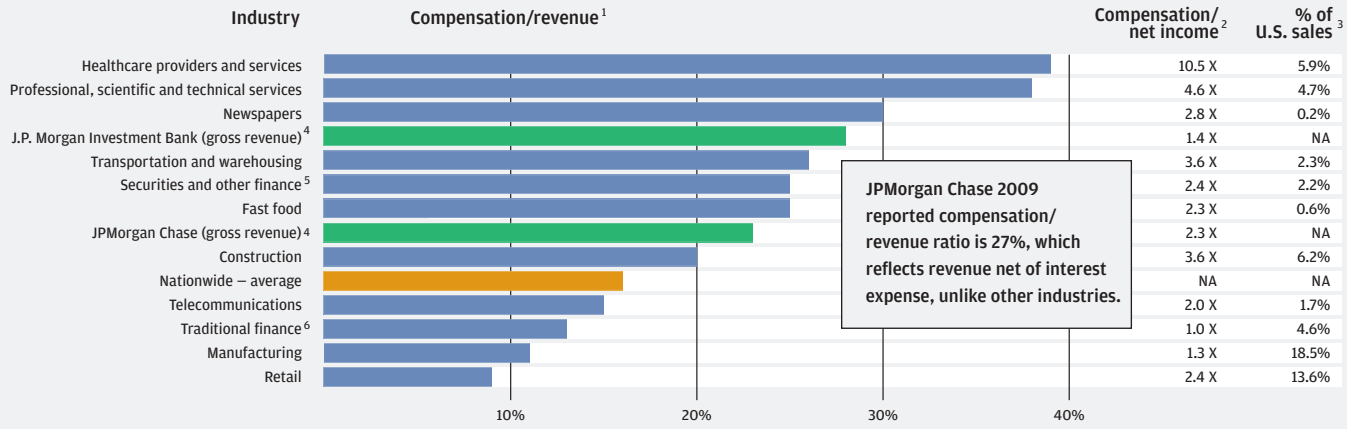
Many commentators, in an attempt to measure fairness and reasonableness of a company's compensation payouts, have looked at total compensation as a percentage of revenue. On this basis, JPMorgan Chase's total compensation (salaries, benefits and bonuses) was 27% for 2009; this number averaged 33% over the previous several years. For our Investment Bank alone – the part of the company receiving the most scrutiny – compensation was 33% of revenue, down from an average of 44% over the last five years.

The chart on the next page compares these same percentages with a wide mix of businesses. For the average U.S. business, total compensation as a percentage of revenue is approximately 16%. In general, at businesses that are people-intensive and not capital- or intellectual property-intensive, such as professional services companies, a high percentage of the company's revenue is paid out to the employees. Law firms, for example (which are not included in the following table), pay out more than 80% of their revenue to their employees. In highly capital-intensive companies, like telecommunications or certain manufacturing companies, payout ratios are considerably lower.

Some commentators also have looked at total compensation as a percent of profits. Here you see a similarly wide range of results.

Essentially, the financial dynamics and structures of various businesses are very different, and looking at these ratios always will produce divergent conclusions – they alone do not reveal very much.

It also is important to point out that at many companies, a significant amount of incentive compensation generally is paid regardless of whether or not the overall company does well. Many companies pay certain individuals based on their specific performance (sales and service employees) and not necessarily on the performance of the company.



JPMorgan Chase does employ a number of highly compensated individuals, probably more than in many other industries – but not

* This includes what JPMorgan Chase contributes to various benefits programs (i.e., 401(k) match, pension, health and welfare, etc.) and employment-related taxes.

** Represents 2009 expense based on U.S. GAAP.

*** While we have 220,000 employees, our health plan covers 400,000 people, which includes covered family members.

Compensation ratios by industry

The industry compensation ratios in the table above reflect 2007 information contained in U.S. Census Bureau data, Capital IQ Compustat records and company filings and are based on revenue before deducting interest expense, whereas JPMorgan Chase and other financial services firms report their compensation ratios based on revenue net of interest expense.

1 Compensation/revenue based on U.S. data only; JPMorgan Chase data based on worldwide totals.

2 Net income margin based on 2004-2008 average for S&P 500 companies and adjusted for exceptional losses/gains.

3 Compensation/sales based on U.S. Census Bureau data.

4 Revenue based on 2009 gross revenue before interest expense.

5 Includes investment banks, asset management firms, capital markets firms and other non-lending financial institutions.

6 Includes regional banks, credit card companies and other credit/lending institutions.

NA – Not applicable.

all. We are unable to find real comparisons. Much of the anger about highly compensated individuals at banks relates to the argument that all of these companies would have failed, which we do not believe is true (more detail on this in the next section). Finally, the more highly paid the individual is at JPMorgan Chase, the higher the percentage of compensation awarded in restricted stock and options.

Before we speak specifically about how we compensate individuals at JPMorgan Chase, it's appropriate to outline our principles.

Some key compensation principles at JPMorgan Chase

We believe the compensation principles we use are best practices and compare favorably with those outlined by outside authorities, such as the G-20, the Financial Services Authority, the Financial Stability Board, the Federal Reserve and the U.S. Treasury. Our principles are as follows:

- Pay a significant percentage of our incentive compensation in stock: at least 67% for the Operating Committee members and approximately 50% for the remainder of our senior management team.
- Structure the stock we grant – restricted stock units or options – to vest over multiple years.
- Require Operating Committee members to retain and hold approximately 75% of the stock they receive from the company after the stock vests.
- Generally do not provide multi-year guarantees to new hires and almost never to current employees.
- Institute meaningful recoupment policies, some of which we enhanced in 2008 and 2009 and are progressively more stringent at higher levels of management. For all employees, if anyone causes material financial or reputational harm to the firm or its business activities, we can recoup the employee's incentives, including stock.
- For approximately 500 senior individuals, unvested stock also can be recouped for failure to properly identify, raise or assess, in a timely manner and as reasonably expected, material risks to the firm.
- For the Operating Committee and for me, unvested stock or options can be recouped not only for the reasons mentioned above but also if reasonable progress toward personal and company goals is not met. This is at the discretion of the Board of Directors.

- Pay our people for performing well over multiple years and for helping to build enduring performance.
- Ensure that financial results – a key metric (but not the only one) we use to pay our people – always include profits adjusted for risk; that is, the more capital a business uses, the more it is assessed a charge for that capital.
- Recognize revenue for complex and long-dated trades or products over multiple years to properly reflect the risk. Try to be as conservative as possible regarding accounting – aiming not to recognize profits at all when we think doing so is inappropriate.

Some of our other compensation principles go beyond what regulators have asked for but, we believe, are equally important. For example:

- We do not have change-of-control agreements, special executive retirement plans or golden parachutes, or special severance packages for senior executives.
- We do not pay bonuses for completing a merger, which we regard as part of the job. When the merger has proved to be successful, compensation might go up.
- We feel strongly that financial outcomes alone do not represent a comprehensive picture of performance. Broader contributions – such as continually honing leadership skills; maintaining integrity and compliance; recruiting and training a diverse, outstanding workforce; building better systems; and fostering innovation, to name just some important qualities – matter a great deal. In fact, in our business, basing compensation solely on financial or quantitative measures, and ignoring qualitative measures, can be disastrous. Good performance in a particular year does not necessarily indicate that the individual did a good job.
- We are mindful that a rising tide lifts all boats so we take into account how much a strong market, as opposed to the initiative of the individual or group, contributed to the results.
- We must be highly competitive on compensation, which is absolutely crucial to being a great company. While we aim to be a company that pays its employees well, it should be because we have been a well-performing company.
- We want our employees to be shareholders. All of the policies described above have been effective in this regard: Our employees own 488 million shares and options, a significant portion of which is unvested – i.e., of no value to the individual if he or she were to leave the company for a competitor. Ownership does not guarantee that our employees will act like owners, but it certainly improves the odds.

How we pay individuals

Our starting point when it comes to compensation is, as it should be, risk-adjusted financial performance. We keep thousands of profit-and-loss statements (by branch, by trading desk, etc.). While we don't maintain incentive compensation pools at such a granular level, we do have hundreds of such pools; we try to maintain a very disciplined approach to relate compensation as closely as possible to performance.

However, we do not stop there. We make adjustments based on our own judgments about how the company is doing (in absolute and in competitive terms) and for very specific business decisions, such as additions to staff or large, new investments that affect profits. In some cases, the impact of these sorts of discretionary factors will be negligible. In other cases, the discretion we exercise may have a significant effect on the size of an incentive compensation pool. If we feel the pool amount was not earned, we do not pay it.

Some individuals are paid incentive compensation based on very specific metrics; for example, people in our call centers, retail branches and operating centers. These metrics may be increased or reduced somewhat by the company's performance. There also are a few senior people who are paid on specific metrics. For example, bankers who manage money for our clients have their compensation tightly tied to the kind of job they did for their clients. I think you would agree that this is completely appropriate.

Most of our senior people are *not* paid by formula – we use multiple metrics to assess performance and then apply a great deal of judgment. In general, the more senior the executive, the more the compensation should relate to the company's performance overall. This is especially true for the leadership team of each business.

When it comes to an individual, we look at his or her performance, the unit results and the overall performance of the company. Since we generally know these individuals well, we evaluate their performance over a multi-year period. It is important that we recognize our best people – many of those in senior positions have generally proved themselves over many, many years.

We also are keenly aware of our competition and know what it would take to replace a person if we had to hire someone new. We cannot operate in a vacuum.

Our most senior people – members of our Operating Committee – have their compensation tightly tied to the company's performance, and they also are evaluated on their leadership skills. In 2008, when the company's earnings were down 64%, your senior management's compensation was down 67% (this doesn't include me; I received no year-end incentive).

We know there are people in this industry who have been extraordinarily well-paid – and, in some cases, overpaid. Some of these people have benefited from profits that turned out to be ephemeral or were the result of excessive leverage in the system. Some benefited from extreme competition for their specific talents, often from hedge funds and other such businesses. While no firm can claim it gets compensation right every time, we at JPMorgan Chase do think we have generally been disciplined when it comes to our decisions. We believe we have the right compensation practices, but that is only one part of building a great company. The most important part is developing great leaders.

Developing leaders

Earlier in this section, I mentioned that my number one priority is to put a healthy and productive succession process in place. As I will be increasingly focused on this process, I would like to share my thoughts about the essential qualities a leader must have, particularly as they relate to a large multinational corporation like JPMorgan Chase.

Leadership is an honor, a privilege and a deep obligation. When leaders make mistakes, a lot of people can get hurt. Being true to oneself and avoiding self-deception are as important to a leader as having people to turn to for thoughtful, unbiased advice. I believe social intelligence and "emotional quotient," or EQ, matter in management. EQ can include empathy, clarity of thought, compassion and strength of character.

Good people want to work for good leaders. Bad leaders can drive out almost anyone who's good because they are corrosive to an organization; and since many are manipulative and deceptive, it often is a challenge to find them and root them out.

At many of the best companies throughout history, the constant creation of good leaders is what has enabled the organizations to stand the true test of greatness – the test of time.

Below are some essential hallmarks of a good leader. While we cannot be great at all of these traits – I know I'm not – to be successful, a leader needs to get most of them right.

Discipline

This means holding regular business reviews, talent reviews and team meetings and constantly striving for improvement – from having a strong work ethic to making lists and doing real, detailed follow-up. Leadership is like exercise; the effect has to be sustained for it to do any good.

Fortitude

This attribute often is missing in leaders: They need to have a fierce resolve to act. It means driving change, fighting bureaucracy and politics, and taking ownership and responsibility.

High standards

Abraham Lincoln said, "Things may come to those who wait ... but only the things left by those who hustle." Leaders must set high standards of performance all the time, at a detailed level and with a real sense of urgency. Leaders must compare themselves with the best. Huge institutions have a tendency toward slowing things down, which demands that leaders push forward constantly. True leaders must set the highest standards of integrity – those standards are not embedded in the business but require conscious choices. Such standards demand that we treat customers and employees the way we would want to be treated ourselves or the way we would want our own mother to be treated.

Ability to face facts

In a cold-blooded, honest way, leaders emphasize the negatives at management meetings and focus on what can be improved (of course, it's okay to celebrate the successes, too). All reporting must be accurate, and all relevant facts must be reported, with full disclosure and on one set of books.

Openness

Sharing information all the time is vital – we should debate the issues and alternative approaches, not the facts. The best leaders kill bureaucracy – it can cripple an organization – and watch for signs of politics, like sidebar meetings after the real meeting because people wouldn't speak their mind at the right time. Equally important, leaders get out in the field regularly so as not to lose touch. Anyone in a meeting should feel free to speak his or her mind without fear of offending anyone else. I once heard someone describe the importance of having "at least one truth-teller at the table." Well, if there is just one truth-teller at the table, you're in trouble – *everyone* should be a truth-teller.

Setup for success

An effective leader makes sure all the right people are in the room – from Legal, Systems and Operations to Human Resources, Finance and Risk. It's also necessary to set up the right structure. When tri-heads report to co-heads, all decisions become political – a setup for failure, not success.

Morale-building

High morale is developed through fixing problems, dealing directly and honestly with issues, earning respect and winning. It does not come from overpaying people or delivering sweet talk, which permits the avoidance of hard decision making and fosters passive-aggressive behaviors.

Loyalty, meritocracy and teamwork

While I deeply believe in loyalty, it often is misused. Loyalty should be to the principles for which someone stands and to the institution: Loyalty to an individual frequently is another form of cronyism. Leaders demand a lot from their employees and should be loyal to them – but loyalty and mutual respect are two-way streets. Loyalty to employees does not mean that a manager owes them a particular job. Loyalty to employees means building a healthy, vibrant company; telling them the truth; and giving them meaningful work, training and opportunities. If employees fall down, we should get them the help they need. Meritocracy and teamwork also are critical but frequently misunderstood. Meritocracy means putting the best person in the job, which promotes a sense of justice in the organization rather than the appearance of cynicism: "Here they go again, taking care of their friends." Finally, while teamwork is important and often

code for "getting along," equally important is an individual's ability to have the courage to stand alone and do the right thing.

Fair treatment

The best leaders treat all people properly and respectfully, from clerks to CEOs. Everyone needs to help everyone else at the company because everyone's collective purpose is to serve clients. When strong leaders consider promoting people, they pick those who are respected and ask themselves, *Would I want to work for him? Would I want my kid to report to her?*

Humility

Leaders need to acknowledge those who came before them and helped shape the enterprise – it's not all their own doing. There's a lot of luck involved in anyone's success, and a little humility is important. The overall goal must be to help build a great company – then we can do more for our employees, our customers and our communities.

The grey area of leadership

There are many aspects of the leadership process that are open for interpretation. This grey area contributes to the complexity of the challenges that leaders – and those who govern them – face. I would like to share with you where I stand with regard to a few of these issues.

Successful leaders are hard to find

There are examples of individuals who have been thrust, wholly unprepared, into positions of leadership and actually perform well – I think of President Harry Truman, among others. I would submit, however, that relying on luck is a risky proposition. History shows that bad or inexperienced leaders can produce disastrous results. While there are possibly innate and genetic parts of leadership (perhaps broad intelligence and natural energy), other parts are deeply embedded in the internal values of an individual; for example, work ethic, integrity, knowledge and good judgment. Many leaders have worked their entire lives to get where they are, and while perhaps some achieved their stature through accident or politics, that is not true for most. Anyone on a sports team, in government or in virtually any other endeavor knows when he or she encounters the rare combination of emotional skill, integrity and knowledge that makes a leader.

Successful leaders are working to build something

Most leaders I know are working to build something of which they can be proud. They usually work hard, not because they must but because they want to do so; they set high standards because as long as leaders are going to do something, they are going to do the best they can. They believe in things larger than themselves, and the highest obligation is to the team or the organization. Leaders demand loyalty, not to themselves but to the cause for which they stand.

Nonetheless, compensation does matter

While I agree that money should not be the primary motivation for leaders, it is not realistic to say that compensation should not count at any level. People have responsibilities to themselves and to their families. They also have a deep sense of "compensation justice," which means they often are upset when they feel they are not fairly compensated against peers both within and outside the company. There are markets for talent, just like products, and a company must pay a reasonable price to compete.

Big business needs entrepreneurs, too

The popular perception is that entrepreneurs – those who believe in free enterprise – exist only in small companies and that entrepreneurs in small companies should be free to pursue happiness or monetary gain as appropriate. Free enterprise, entrepreneurship and the pursuit of happiness also exist in most large enterprises. And you, our shareholders, should insist on it. Without the capacity to innovate, respond to new and rapidly changing markets, and anticipate enormous challenges, large companies would cease to exist. The people who achieve these objectives want to be compensated fairly, just as they would be if they had built a successful start-up.

Performance isn't always easy to judge

Managers responsible for businesses must necessarily evaluate individuals along a spectrum of factors. Did these individuals act with integrity? Did they hire and train good people? Did they build the systems and products that will strengthen the company, not just in the current year but in future years? Did they develop real management teams? In essence, are they building something with sustainable, long-term value? Making these determinations requires courage and judgment.

Sometimes leaders should be supported and paid even when a unit does poorly

If a company's largest, and perhaps most important, business unit is under enormous stress and strain, unlikely to earn money regardless of who is running it, a manager might ask his best leader to take on the job. This may be the toughest job in the company, one that will take years to work through before the ship has been righted. When the manager asks a leader to take on the responsibility, she quite appropriately will want to know whether she will be supported in the toughest of times: "Will you make sure the organization doesn't desert me?" "Will you stop the politics of people using my unit's poor performance against me?" "Will you compensate me fairly?" My answer to all of these questions would be yes. And as long as I thought she were doing the job well, I would want to pay her like our best leaders, profits aside. Conversely, we all know that a rising tide lifts all boats. When that's the case, paying that leader too much is possibly the worst thing one can do – because it teaches people the wrong lesson.

Evaluating the CEO

The CEO should be held strictly accountable by the Board of Directors. The Board should continually review the CEO's performance and give feedback (and coaching). The Board alone should determine the compensation for the CEO. At every regularly scheduled Board meeting at JPMorgan Chase, the directors also have a private meeting without me. Compensation committees and the Board need to be independent thinkers – and yours are. They review lots of data to evaluate the performance of the company, including reviewing competitors' performance and their compensation practices. Our Board members do not rely on compensation consultants to make decisions for them. The Board members believe that determining how to compensate the CEO (and all of our senior management) is their responsibility and cannot be outsourced.

In two of the last 10 years, I received no bonus, which I thought was absolutely appropriate. In 2000, Bank One was in terrible shape – we had to lay off approximately 10,000 people, and I thought it completely inappropriate that I take a bonus. That year, my first at Bank One, I had a guarantee – I gave it up. The second time was in 2008, and our financial results were just too mediocre to contemplate a bonus for the CEO. Since we did pay many other people in those two years, we also lived by the principle that the CEO does not have to be the highest paid person in the company.

In all the years I've worked at this company, much of my compensation (approximately 65%) has been in stock. I've never sold a share and do not intend to do so as long as I'm in this job. In fact, when I joined Bank One, I bought a lot of stock outright, not because I thought it was cheap (in fact, I thought it was overvalued) but because I wanted to be tethered tightly to the company and its performance.

III. OUR SUPPORT OF FINANCIAL REFORM THAT WILL STRENGTHEN THE FINANCIAL SYSTEM

We need rational policies based on facts and analysis

The recent financial crisis has caused great distress across the country and around the world, but it also has provided us with a path for going forward. The era of bailouts must end, and the oversight of system-wide risk must increase, among other changes. David Hume said, "Reason is ... slave of the passions ..." But if we rewrite the rules for banks out of anger or populism, we'll end up with the wrong solutions and put barriers in the way of future economic growth. Good policy and financial reform must be based on facts and analysis and need to be comprehensive, coordinated, consistent and relevant.

As *New York Times* columnist Thomas L. Friedman noted earlier this year, "We need a new banking regulatory regime that reduces recklessness without reducing risk-taking, which is the key to capitalism." In striking this regulatory balance, the details matter. We should focus on building good regulation – not simply more or less of it. The last thing we need is to enact new policies that over-regulate and work at cross-purposes without reducing system-wide risk. None of us can afford the costs of unnecessary or bad regulation.

While we acknowledge that making good decisions takes time, we think it is important to complete financial reform this year. The lack of regulatory clarity is creating problems for banks and for the entire economy. Businesses need confidence and certainty to grow (and to create jobs). Passing sensible financial reforms will provide some of the certainty the business sector needs. With this in mind, I would like to discuss the critical lessons learned and how they are central to getting regulatory reform right.

The crisis had many causes

In my 2008 letter to shareholders, I discussed the fundamental causes and contributors to the financial crisis. I won't repeat them in detail here, but, broadly speaking, they were as follows:

- The burst of a major housing bubble, caused by bad mortgage underwriting, a somewhat unregulated mortgage business and some misguided government policies.
- Excessive, pervasive leverage across the system, including banks, investment banks, hedge funds, consumers and the shadow banking system.
- The dramatic growth of structural risks and the unanticipated damage they caused (the flaws of money market funds and the repo system). Remember, we had a "run" on the capital markets.
- Regulatory lapses and mistakes: Basel capital rules that required too little capital and didn't account for liquidity and relied too much on rating agencies; the Securities and Exchange Commission allowing U.S. investment banks to get too leveraged; and poor regulation of Fannie Mae and Freddie Mac, among many elements of an archaic, siloed regulatory system. However, we should not and do not blame regulators for the failures of individual companies, ever – management is solely to blame.
- The pro-cyclical nature of virtually all policies, actions and events (e.g., loan loss reserving, capital requirements and the market itself).
- The impact of huge trade and financing imbalances on interest rates, consumption and speculation levels.

The heart of the problem – across all sectors – was bad risk management. Many market participants improperly used value-at-risk (VaR) measurements; they did not run stress tests to be prepared for the possibility of a highly stressed environment; they excessively relied on rating agencies; they stretched too much for current earnings; and they didn't react quickly when markets got bad.

At JPMorgan Chase, we never overly relied on VaR, and we regularly ran stress tests to make sure we were prepared for bad environments. Our goal was and is to remain profitable every quarter.

While it is tempting to identify a scapegoat – banks, businesses, the government or consumers – it is pretty obvious that no one was solely to blame and that no one should be completely absolved from blame.

Yes, we made mistakes ...

... and we have identified and described them in great detail in prior years' chairman's letters. Our two largest mistakes were making too many leveraged loans and lowering our mortgage underwriting standards. While our mortgage underwriting was considerably better than many others', we did underwrite some high loan-to-value mortgages based on stated, not verified, income. We accept complete responsibility for any and all mistakes we made or may have made.

There also are many mistakes that we did not make, among them: structured investment vehicles (SIVs), extreme leverage, excessive reliance on short-term funding, collateralized debt obligations and improper management of our derivatives book.

Some of the mistakes we made may have contributed to the crisis. For those, of course, we are sorry – to both the public and our shareholders. However, it would be a huge stretch to say that these mistakes *caused* the crisis. In fact, at the height of the crisis, we aggressively took actions that we believed helped mitigate some of the fallout from the crisis and contributed to the stabilization and recovery (e.g., our purchase of Bear Stearns and WaMu and our interbank lending; that is, loans that banks make directly to each other).

Yes, we should thank the government for its extraordinary actions

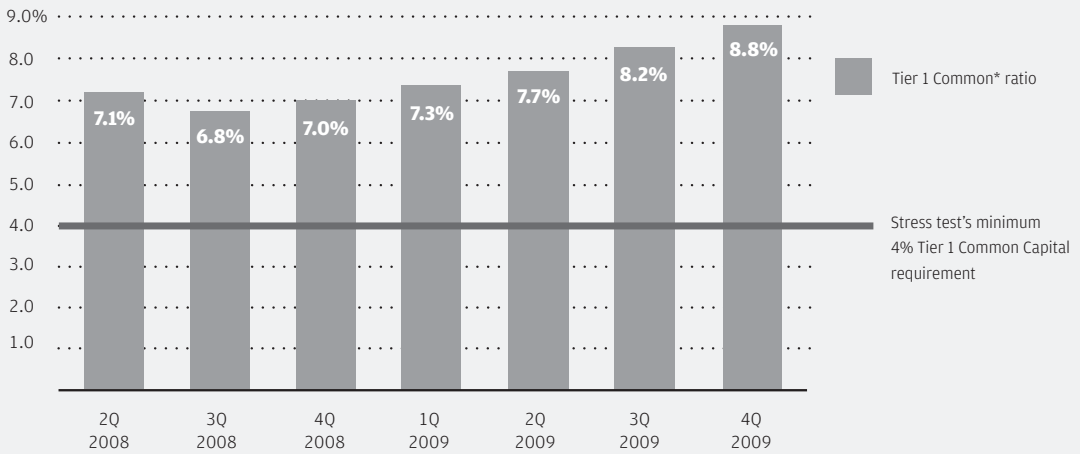
As noted in last year's letter, we think the government acted boldly and urgently in dealing with a complex and rapidly changing situation. Without many of these actions, we believe the outcome could have been much worse. A great number of the actions that the Treasury and the Federal Reserve took, directly and indirectly, benefited a number of institutions and may have saved many from failure and bankruptcy.

Without these actions, however, not all banks would have failed

The premise that all banks would have failed had it not been for the government's actions is incorrect. This premise is behind much of the anger toward banks and some of the policy recommendations that are meant to punish banks. We should acknowledge that the worst offenders among financial companies no longer are in existence. And while it is true that some of the surviving banks would not, or might not, have survived, not all banks would have failed. I know I speak for a number of banks when I say that some of us accepted the Troubled Asset Relief Program (TARP) capital not because we needed it to survive but because we believed we were doing the right thing to help the country and the economy. We were told the government wanted even the healthy banks to take TARP to set an example for all banks and to make it easier for the weaker institutions to accept the capital without being stigmatized. JPMorgan Chase and many other banks were in a position to try to help, and that is what we did.

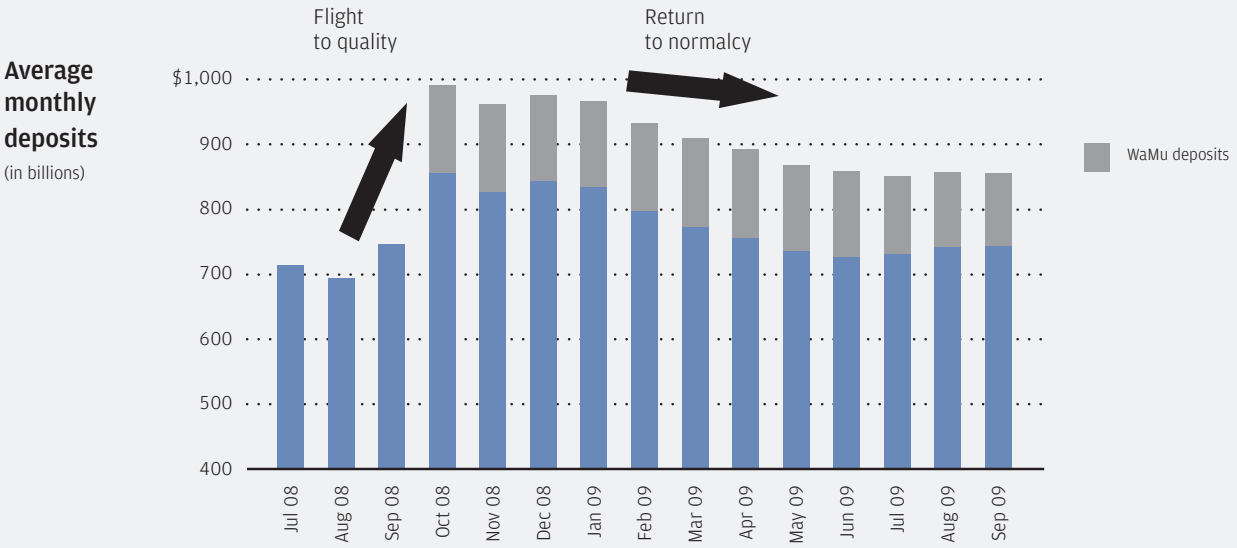
At the worst point in the crisis, we aggressively provided credit

Throughout the financial crisis, JPMorgan Chase never posted a quarterly loss. We served as a safe haven for depositors, worked closely with the federal government and remained an active lender.



Our fortress balance sheet enabled us to buy Bear Stearns in March 2008, adding $289 billion in assets; then we acquired Washington Mutual just six months later, adding a further $264 billion of assets. Through it all, JPMorgan Chase absorbed the stress of higher consumer and wholesale credit losses while maintaining high liquidity and acceptable growth in our capital. We acquired Washington Mutual *just 10 days after* Lehman Brothers' collapse on September 15, 2008, and, in order to maintain our fortress balance sheet, immediately sold $11.5 billion in common stock the following morning. The takeover of Bear Stearns and WaMu provided essential credit and support to the system and minimized a potentially disastrous disruption that could have resulted from their failures. In the several months after Lehman's failure, our interbank lending grew from almost nothing to as high as $70 billion, and our average lending was approximately $100 billion per month, even higher than it had been in the prior months. We also purchased, at one point, a net $250 billion of securities, which helped facilitate much-needed liquidity in the marketplace.

We consistently maintained extremely high capital levels



As the chart below shows, we ended 2008 with Tier 1 Common Capital of 7.0% (the critical measure used by the Federal Reserve for its bank stress tests), and we ended 2009 with Tier 1 Common Capital of 8.8%.

In May 2009, the U.S. government ran a stress test on 19 banks. The test assumed an adverse environment of 10.4% unemployment and a 48% peak-to-trough decline in the housing price index across a two-year time span. Upon completion of the test, the results required 10 banks to raise common equity to maintain 4% Tier 1 Common Capital through the end of the stress scenarios. Under the government's test, JPMorgan Chase always had common equity of $40 billion *in excess* of the 4% minimum (for the record, the $25 billion of TARP capital we accepted was preferred stock and, therefore, never was part of this calculation). The bottom line is that we passed the stress test with flying colors.

Quarterly capital levels

* The Tier 1 Common ratio is Tier 1 Common Capital divided by risk-weighted assets. Tier 1 Common Capital is predominantly Tier 1 Capital less preferred equity, noncontrolling interests and trust preferred capital debt securities. Tier 1 Common Capital is the first element of capital to absorb losses. See page 90 for further discussion.

We kept our liquidity extremely high

As we entered the most tumultuous financial markets since the Great Depression, we experienced the opposite of a "run on the bank" as deposits flowed in (in a two-month period, $150 billion flowed in – we barely knew what to do with it). At JPMorgan Chase, our deposits always exceeded our loans; deposits always have been considered one of the safest sources of funding for a bank. The average bank has loans that are generally greater than 110% of its deposits. For JPMorgan Chase, loans were approximately 75% of deposits. In fact, our excess deposits greatly reduced the need to finance ourselves in riskier wholesale markets.

In the long-term wholesale unsecured markets, we borrowed on average $270 billion. Only $40 billion was borrowed unsecured in the short-term credit markets – an extraordinarily low amount for a company of our size. When we borrow in the secured markets, we do so under the assumption that we would have access to some, not all, of that funding in a crisis.

We always maintained excess liquidity at the bank holding company. We had and continue to have enough cash or cash equivalents on hand to fund ourselves for more than two years, even in the event that we are unable to borrow from the unsecured credit markets at all.

We were prepared for things to get even worse

While the economic environment had become as bad as any of us had ever seen, we reluctantly prepared for the situation to get worse, with a possible U.S. unemployment rate of 15% or higher. Such an adverse environment would have required drastic actions: a large headcount reduction, elimination of marketing and other investments, and a decrease in lending to preserve capital. Steps like these would have saved more than $12 billion in expenses and created considerable additional capital. However, it also would have imposed deep hardship on many of our employees, suppliers and customers. Fortunately, we never had to execute such a drastic plan. This was precisely what the government was trying to avoid, and I believe its actions helped prevent many companies from taking steps like those mentioned above.

Government programs were a mixed blessing

While we deeply appreciate the government's actions – and they clearly had benefits for the system and for JPMorgan Chase – they also were a mixed blessing.

In June 2009, we paid back the TARP capital in full. The $25 billion we borrowed for eight months cost us money, because we never were able to lend the $25 billion and earn a rate

higher than the 5% coupon we were paying on the preferred shares. In addition, we gave the government warrants worth almost $1 billion – a direct cost to our shareholders.

We did participate in the Federal Deposit Insurance Corporation (FDIC) guarantee program, under which we issued $40 billion of debt with an FDIC guarantee. Many banks that used this program would not have had access to the capital markets without this guarantee and possibly could have failed. For JPMorgan Chase, it was not a question of access or need – to the extent we needed it, the markets always were open to us – but the program did save us money. As part of this program, we have paid the FDIC $1.3 billion, and, after paying the FDIC, it will save us a significant amount of money over the next few years.

Our company was highly criticized for accepting the TARP capital and for using the FDIC program. After April 1, 2009, even though we were eligible to continue using the FDIC program, we stopped using it. There were many other government programs (with acronyms such as TALF and PPIP) that we believe were beneficial to the capital markets, but that we did not need and chose not to use, so as to avoid the stigma. (We did use the Term Auction Facility (TAF), a special government-sponsored depository facility, but this was done at the request of the Federal Reserve to help motivate others to use the system.)

While no one knows what would have happened in the absence of all these government programs, there is a strong argument that those that entered the crisis in a position of strength may have gathered huge benefits at the expense of failing competitors – but it is hard to argue that this would have been good for the country.

We did not anticipate the anger or backlash the acceptance of TARP capital would evoke from the public, politicians and the media – but, even with hindsight, I think we would have had to accept TARP capital because doing so was in the best interest of the country. I do wish it would have been possible to distinguish between the healthy and unhealthy banks in a way that didn't damage the success of the program – so as not to create a situation where the public was left with the impression that all banks were bailed out. Last, I do regret having used the FDIC guarantee because we didn't need it, and it just added to the argument that all banks had been bailed out and fueled the anger directed toward banks.

The government runs the FDIC, but the banks pay for it

While the FDIC is a government institution that insures bank deposits, our shareholders should know that the costs associated with failed banks are borne in full by the banks, not by taxpayers. We think this is completely appropriate. Even if the FDIC's special Temporary Liquidity Guarantee Program (TLGP) had lost money, those losses would have been charged back to the surviving banks. Therefore, it is these surviving banks that have paid for the cost to the FDIC of the approximately 200 bank failures since the beginning of 2008.

Of those failures, the largest one, WaMu (with assets exceeding $260 billion), has cost the FDIC nothing. That is because JPMorgan Chase bought WaMu. All of the other banks that have failed were far smaller (the next largest failure was IndyMac, with $32 billion). All of these failures combined have cost the FDIC an estimated $55 billion.

Between deposit insurance and TLGP funding for 2008 and 2009, plus estimates for our share of assessments over the next three years, JPMorgan Chase alone will have given the FDIC a total of approximately $6 billion to cover the cost of failed banks.

Banks are lending – a little less but more responsibly

A great deal of media attention recently has focused on what it will take to get banks lending again. The reality is that banks never have stopped lending: As of the end of February 2010, according to the latest data from the regulatory reports, total loans held by commercial banks stood at $6.5 trillion – higher than at the end of June 2007 and more than 30% higher than in 2004.

How is it that businesses and consumers clearly feel they have less access to bank credit while the banks claim they are still lending? This disconnect can be explained as follows:

1. The flow of non-bank lending, which has accounted for 65% of the credit supplied in the United States, dried up. Many non-bank lenders (think of the shadow banking system, SIVs, the asset-backed commercial paper market and the securitization markets) virtually collapsed. These sources of credit alone – and they were funded by insurance companies, pension plans, and corporate and foreign investors – reduced the credit they were providing to the system by nearly half a trillion dollars.

2. Bank lending did go up in the months immediately after Lehman's collapse, but during the course of 2009, bank lending started to decline in total. While more than 100 banks, including JPMorgan Chase, stepped up and acquired failing banks, they could not and did not fully replace the extension of credit the failing banks had been providing. For example, at JPMorgan Chase, we did not continue the subprime lending and option-ARM mortgages that WaMu had been providing.

3. Many banks also tightened their loan standards, which further reduced new loans.

4. Additionally, customer demand for loans decreased across large and small businesses. In fact, at JPMorgan Chase alone, loans to large companies dropped (from $85 billion to $50 billion). This was not due to our reluctance to make the loans but rather to large companies taking advantage of the ability to finance at lower rates in the reopened capital markets.

Banks have a responsibility to make sound loans. Bad loans are one of the things that got us into this mess in the first place. And, unfortunately, making good loans often means declining applications for loans that do not meet safe and sound lending criteria. While it may not seem obvious at the time, turning down an application that fails to meet these criteria actually may be in both our and our client's best interest. We have a responsibility to lend only to those who can handle the debt. Unlike many other businesses, this puts us in the unpopular position of saying no to some of our customers.

Banks are not fighting regulation

We at JPMorgan Chase and at other banks have consistently acknowledged the need for proper regulatory reform, and I also spoke about this topic in great detail in last year's letter.

Looking back, one of the surprising aspects about the recent crisis is that most of the specific problems associated with it (global trade imbalances, the housing bubble, excessive leverage, money market funds, etc.) were individually well-known and discussed. But no one, as far as I know, put together all of the factors and predicted the toxic combination it would become – and the crisis it would cause.

So what can we do to help fix the situation going forward? We must focus on the problem: bad risk management. This not only caused financial institutions to fail, but it also revealed fundamental flaws in the system itself. These flaws existed at both a macro level, where the interplay of the numerous critical factors was missed, and a micro level: for example, the failure to prevent AIG from taking excessive, one-sided positions in trading derivatives and the failure to limit mortgages to families who could afford them and to keep loan-to-value ratios to a more reasonable 80%-90%.

Over the last 50 years, we have allowed our regulatory system to become dangerously outdated. The structure is archaic and leaves huge gaps in the system. Today, in America, banks account for only one-third of the credit outstanding, with all kinds of non-banks taking and trading risks and providing credit to the system. So the idea that banking is confined to deposit-holding entities is inaccurate and deceptive. The failure of so many firms in a range of sizes and categories – from Bear Stearns and Lehman Brothers to IndyMac and WaMu to Fannie Mae, Freddie Mac and AIG, as well as local community banks – proves that regulation needs to be administered by product and economic substance, not by legal entity. We have a chance to simplify and strengthen our regulatory system, and, if we do it right, it will not only be able to handle the complex challenges we face today but will be able to do so in a way that will be flexible enough to continuously adapt to our changing world.

We support a systemic regulator

Going forward, we will need a systemic regulator charged with effectively monitoring the spread and level of risk across the financial system in its entirety. Think of it as a "super risk" regulator. Such a regulator would not eliminate all future problems, but it would be able to mitigate them. If we had eliminated just *some* of the problems, it might have stopped the crisis from getting this bad. Congress appears to be well on its way to creating just such a regulator, and we hope it succeeds.

Some issues the systemic risk regulator should keep in mind are the following:

- Focusing the process on managing risk. This should not be a political process. It should function like a strong risk management committee.
- Eliminating gaps and overlaps in the system. For example, mortgages were regulated by multiple entities, some of which did a terrible job, causing a "race to the bottom" as even good companies started to do bad things to maintain market share.
- Analyzing areas like the mortgage market and other elements of the consumer-finance system to ensure that when new rules are written, they create a sound, safe, effective and consumer-friendly mortgage market.
- Carefully tracking new products, as they often are the source of many problems.
- Reviewing credit across the whole system – including "hidden" extensions of credit, such as enhanced money market funds and SIVs.
- Aggressively monitoring financial markets and potential excesses, or bubbles. It may be hard to detect bubbles, and it may be inadvisable, once detected, to exert a direct influence on them with macro economic policy. However, it is appropriate to try to minimize the collateral damage bubbles can cause. It also would be appropriate to try to manage bubbles, not by using monetary policy but by restricting credit on specific markets (i.e., it would have been appropriate to ask lenders to reduce loan-to-value ratios in mortgages or to minimize speculation in the financial markets by reducing the leverage used in the repo markets).
- Recognizing distortions as they develop in the broader economy (fiscal deficits, trade imbalances, structural state budget deficits) and forcing policy bodies to anticipate the problems that may result.
- Encouraging international coordination as much as possible – not only so companies compete on a level playing field but also because crises don't stop at national borders.

These are just some of the ways a systemic regulator could help fix the flaws in our regulatory framework and create a system that *continually adapts and improves itself.*

We support an enhanced resolution authority – and the elimination of "too big to fail"

Even if we achieve the primary goal of regulating financial firms to prevent them from failing, we still have to get government out of the business of rescuing poorly managed firms. All firms should be allowed to fail no matter how big or interconnected they are to other firms. That's why we at JPMorgan Chase have argued for an enhanced resolution authority that would let regulators wind down failing firms in a controlled way that minimizes damage to the economy and will never cost the taxpayer anything. Fixing the "too big to fail" problem alone would go a long way toward solving many of the issues at the heart of the crisis. Just giving regulators this authority, in and of itself, would reduce the likelihood of failure as managements and boards would recognize there is no safety net. Think of this enhanced resolution as "specialized bankruptcy" for financial companies. The principles of such a system would be as follows:

- A failure should be based on a company's inability to finance itself.
- The regulator (or specialized bankruptcy court) should be able to terminate managements and boards.
- Shareholders *should* be wiped out when a bank fails – just like in a bankruptcy.
- The regulator could operate the company both to minimize damage to the company and to protect the resolution fund.
- The regulator could liquidate assets or sell parts of the company as it sees fit.
- Unsecured creditors *should* recover money only after everyone else is paid – like in a bankruptcy. (In fact, the resolution authority should keep a significant amount of the recovery to pay for its efforts and to fund future resolutions.)
- In essence, secured creditors should be treated like they are treated in a bankruptcy.
- The resolution fund should be paid for by the financial industry (like the FDIC is today).
- All institutions under this regime should live with *the exact same rules.*
- Regulators should make sure that companies have enough equity and unsecured debt to prevent the resolution fund from ever running out of money. To give an example, while Lehman had $26 billion in equity, it also had $128 billion in unsecured debt. A resolution regulator, in my opinion, would clearly have been able to let Lehman meet its obligations, wind it down and/or sell it off and still have plenty of money left over to return some money to the unsecured creditors. Had this been done wisely, the economy would have been better off.
- If a firm fails, there should be enough clarity about the financial, legal and tax structures of that firm to allow regulators, cooperating across international boundaries, to wind it down in a controlled manner – what some refer to as "living wills."
- While there is no argument about who should pay for the resolution (i.e., banks), there are some technical issues about how it should be funded. The resolution regulator does need to be able to fund these companies while they are being wound down, and there are plenty of appropriate ways to accomplish this.

Once it is established that any firm can fail, firms of all sizes and shapes should be allowed to thrive. It is wrong to assume that big firms inherently are risky. Banks shouldn't be big for the sake of being big, but scale can create value for shareholders and for consumers who are beneficiaries of better products that are delivered more quickly and less expensively. These benefits extend beyond individuals to include businesses that are bank clients, particularly those that are global in scale and reach, and the economy as a whole.

Many banks' capabilities, size and diversity enabled them to withstand the crisis and emerge from it as stronger firms. This strength, in turn, made it possible for many firms to acquire weaker firms at the government's request and help to alleviate potential damage to the economy.

Closing comments on regulation

While we support the general principles behind enhanced regulation of derivatives, securitizations and enhanced consumer protections, we do not support each and every part of what is being recommended. The devil is in the details, and it is critical that the reforms actually provide the important safeguards without unnecessarily disrupting the health of the overall financial system.

We also believe there are some serious ideas that need attention if the system is to be made more fail-safe:

- Repo markets could be better structured, monitored and controlled.
- Loan reserving could be made far less pro-cyclical.
- Securitization markets could be fixed so that both originators and distributors have skin in the game.
- A system could be put into place to prevent a "run" on money market funds.
- The ability to buy shareholder or creditor voting rights without owning and being exposed to the risks of owning the underlying securities should be extremely limited. Investors should not have the ability to vote the capital securities actually owned if the investors are voting for the failure of the company and stand to gain more on their short positions than on their long positions.
- Finally, we support strong controls on so-called "naked short selling."

During the past year's discussion among regulators and legislators, many other ideas have been proposed or recommended – from the Volcker Rule to new bank taxes to changes in Basel capital. These ideas are all in varying stages of development and are too undefined to comment on here. What we would urge our regulators and legislators to do is proceed with clarity and purpose and avoid broadly penalizing all firms alike – regardless of whether they were reckless or prudent.

IV. OUR RESPONSIBILITY AND AMERICA'S SUCCESS

As we grapple with the enormity of the issues facing the nation, we must not lose sight of our strengths. America has successfully brought these strengths to bear on crises in the past – some much bigger than the current one – and I am optimistic about our ability to do so again.

America's success as a nation requires a strong and growing economy. A strong and growing economy requires the right kind of government policies and a private sector that is innovative as well as responsible. Responsible businesses can be both small and large – and, in a global economy, it behooves America to have large multinational companies that are operating on a global stage. Creating a culture that ties it all together requires a greater sense of shared responsibility.

America's success is not a God-given right – it is something we always must work hard to achieve.

The need for a strong economy and good government

America's success depends upon many things, including good government (and the strength of our exceptional military). But it cannot succeed without a healthy and vibrant economy. That is what allows us to share the rewards of success, defend our nation, educate our children and build a better future.

A strong U.S. economy, one with the ability to continually improve and reform itself, depends on good government. Bureaucracy is lethal, and we cannot let it drain the energy, talent, creativity, drive and goodwill of our citizens – or those we encourage through our example, many of whom come to work and innovate in America. To thrive, our country and our economy need:

- Legal clarity and consistency.
- The fair application and steadfast enforcement of the rule of law.
- Trade policies conducive to growing the American economy and the global competitiveness of U.S. companies.
- Immigration policies that allow America to attract the world's best and brightest – an essential ingredient of our success as a nation.
- Sensible and effective regulation that protects investors and the public.
- A strong and efficient infrastructure (from highways and bridges to electrical grids, etc.).
- The proactive promotion of economic growth and rules that foster U.S. capital accumulation.
- Policies facilitating job growth, as opposed to those that inadvertently make it harder to hire.

Countries can have different social values and objectives (though I believe most countries and most citizens would like to reduce poverty and suffering). But countries should not confuse values and objectives with maintaining a strong economy.

Healthy and growing countries can do wonderful things for their people. And countries that fail to create healthy economies frequently relegate their people to increasing levels of pain and suffering. Many countries have professed wanting to help their people but, instead, have damaged their countries and hurt their people. Maybe the intentions were real, but, even if they were, the road to hell is often paved with good intentions.

Brazil is an example of a country that seems to be successfully using pro-growth policies to expand its economy while using the wealth from that economic growth to finance important social programs. Over the last 20 years, Brazil has adopted many policies that dramatically strengthened its economy. It also bolstered its institutions, privatized its businesses, improved the rule of law, left the bulk of capital allocation to the private capital markets and developed world-class companies.

Eight years ago, Brazil elected a left-leaning president, but he continued policies to strengthen the economy. He also used some of the wealth to start a program called Bolsa Familia that gave Brazil's poorest citizens vaccinations, education and $80 a month for food.

The lesson is clear: Good policies and economic growth are not the enemy of social progress – they are the fuel for progress.

Businesses need to be responsible – and healthy and vibrant

At JPMorgan Chase, we feel a deep responsibility to build a company that benefits our customers, our employees, our shareholders and the communities in which we operate around the world. The best companies don't make decisions for short-term profits. Contrary to public opinion, corporations are not in business solely to maximize quarterly earnings but rather to serve clients and earn their trust over a long period of time and, in so doing, earn a fair profit. Profits in any one year, in effect, are a reflection of decisions that may go back decades.

We always have been deeply committed to being good corporate citizens and adhering to the following practices:

- Treating our customers and employees with the respect they deserve.
- Building safe and useful products.
- Maintaining ethical and responsible business practices.
- Meeting our fiduciary responsibilities and creating real value for shareholders.
- Developing a company for the long run – one that stands the test of time.
- Making a meaningful difference through philanthropic endeavors in supporting our communities.
- Acknowledging our mistakes (which are a natural part of doing business), fixing them and learning from them.
- Supporting the economies in which we work through job creation and appropriate tax payments. JPMorgan Chase, on average, pays more than $12 billion a year in taxes to governments around the world.

Building a great company allows investment in the future, provides opportunities to employees, builds better products for customers and serves communities. Companies that are not healthy and vibrant cannot do these things.

Businesses – small to large – are one of America's key strengths

A healthy business sector is fundamental to our economic strength: Of the 130 million people who go to work every day in the United States, nearly 110 million are employed by private businesses. These private businesses are and always have been the nation's primary drivers of job creation and innovation.

The strength of the business sector is rooted in its diversity, from the smallest start-up or family-owned firm to the largest multinational corporation.

Indeed, the relationship between larger and smaller businesses is symbiotic. Studies show that for every one job created at a larger business, five jobs are created at smaller businesses that provide supporting goods and services. At JPMorgan Chase, in particular, we spend more than $15 billion per year with approximately 40,000 vendors, who provide jobs to millions of employees.

We need global flagship companies – including banks

In the current political environment, size in the business community has been demonized, but the fact is that some businesses require size in order to make necessary investments, take extraordinary risks and provide vital support globally. America's largest companies operate around the world and employ millions of people. This includes companies that can make huge investments – as much as $10 billion to $20 billion a year – and compete in as many as 50 to 100 countries to assure Amer-

ica's long-term success. Combined, big and small businesses spend $1.5 trillion per year on capital expenditures and $300 billion on research and development. It is estimated that more than 70% of the capital expenditures are made by large companies.

The productivity of our workers and the huge economies of scale of our corporations (generated from years of investing and innovating) are what ultimately drive our economy and income growth. Employees at large companies share in that productivity: Compensation and benefits for employees at large companies are substantially higher than at small firms.*

It is estimated that large enterprises and large foreign multinationals active in the United States have accounted for the majority of U.S. productivity growth since 1995.

Companies such as Ford, Boeing, Pfizer, Caterpillar, Apple, Microsoft and Google are exemplars of initiative and innovation worldwide. Cutting-edge companies like Hewlett-Packard underpin vibrant networks of small and mid-size suppliers and vendors. Academic research shows that these investments abroad actually create more jobs in the United States.

Large companies such as the ones mentioned above need banking partners with large enough balance sheets to finance transactions around the world. And it's not just multinational corporations that rely on such scale: States and municipalities also depend on the capital that a firm like JPMorgan Chase can provide. To be sure, smaller banks play a vital role in our nation's economy but cannot always provide the type of service, capital, breadth of products and speed of execution that clients need. Only large banks have the scale and resources to connect markets around the globe, in places like China, India, Brazil, South Africa and Russia; to execute diverse and large-scale transactions; to offer a range of products and services, from loan underwriting and risk management to local lines of credit; to process terabytes of financial data; and to provide financing in the billions.

U.S. banks actually are less consolidated than those in the rest of the world, and our financial system is less dominated by large banks than that of almost any other nation. For example, in 2007, the three largest U.S. banks held 34% of total U.S. bank assets – the second-lowest figure among Organisation for Economic Co-operation and Development (OECD) nations, just ahead of Luxembourg; the average for the rest of the OECD nations was more than double, at 69%. Not only is our banking system not particularly concentrated, but our large banks are not relatively large compared with the size of the U.S. economy. The arguments that "big is bad" and that "too consolidated is bad" are refuted by many examples of countries with large, consolidated banking systems that did not have problems at all (e.g., Canada).

Capping the size of America's largest banks won't change the needs of big business. Instead, it will force these companies to turn to foreign banks that won't face the same restrictions. JPMorgan Chase's capabilities, size and diversity were essential to withstanding the financial crisis in 2008 and emerging as a stronger firm.

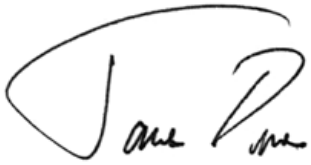
Everyone needs to be responsible

America was built on the principles of rugged individualism and self-responsibility. We need to continue to foster a sense of responsibility in all participants in the economy. Bad outcomes are not always someone else's fault – we need to cultivate an environment where consumers, lenders, borrowers, businesses and investors all take responsibility for their actions and don't look for someone else to blame. We have to stop slipping into a cacophony of finger-pointing and blame. And while bad actors always should be punished, we also should note that not all who got into trouble were irresponsible. We fully acknowledge, for example, that many individuals found themselves in a difficult position that was caused by a medical condition or loss of employment beyond their control, and they should be treated fairly and respectfully.

The crisis of the past couple of years has had far-reaching consequences, among them the declining public image of banks and bankers.

* The U.S. Bureau of Labor Statistics shows that employees of large firms (with 500 or more employees) have average hourly earnings ($25/hour, including wages and salaries) 46% higher than employees of small firms (with fewer than 50 employees). Similarly, large firms provide 88% of their employees access to medical benefits compared with 55% at small firms.

While JPMorgan Chase certainly made its share of mistakes in this tumultuous time, our firm always has remained focused on the fundamentals of banking and the part we can play to support our clients and communities. Our 220,000 people go to work every day to do a great job serving clients, whose trust we have to earn over many years. The vast majority of our people, customers, operations and shareholders are far from Wall Street – they actually are part of the everyday life of Main Street, in virtually every part of the country. And they are active and contributing members of society in communities around the world.



Very often, when the public or politicians take punitive efforts against banks like ours, they think they are punishing only the senior management team, when, in fact, they are punishing ordinary shareholders as well. Contrary to popular perception, Main Street owns our biggest banks and corporations through savings and retirement funds. Our shareholders represent a true cross section of America, including teachers, retirees and public employees. When we reduce the debate over responsibility and regulation to simplistic and inaccurate notions, such as Main Street vs. Wall Street, big business vs. small business or big banks vs. small banks, we are indiscriminately blaming the good and the bad – this is simply another form of ignorance and prejudice.

By extension, when we vilify whole industries or all of the business community, we are denigrating ourselves and much of what made this country successful. We also should refrain from indiscriminate blame of any whole group of people, including politicians or the media. We need to focus a bit less on daily media and polls and more on the books that will be written after this crisis subsides. We all should ask ourselves whether we, in a time of stress, did the right things the right way for the right reasons.

Conclusion

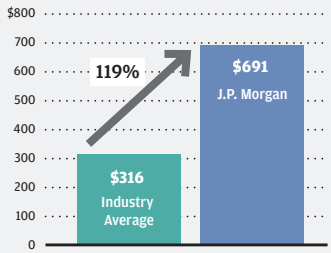
The United States faces many challenges. In the short run, overcoming this economic crisis and getting our unemployed back to work are most important. In the long run, we must confront our health and education systems; develop a real, substantive energy policy; and build the infrastructure for the future. We also must confront the large U.S. deficit, being honest about the facts and being fiscally responsible for ourselves – it is dangerous to wait for the global markets to pressure us into that discipline. These are all serious challenges, but, if we work together, we can fix them.

Your company continues to do everything it can, in every community in which we work, to help the world recover as quickly as possible. In 2009, as they have so many times before, our people rose to the challenge, working amid tremendous uncertainty in a fragile economic and political environment. They also have coped with the anger directed toward the financial services industry. Through it all, they did not lose focus on why we are all here: to serve clients and, therefore, our communities around the world. On behalf of JPMorgan Chase and its management and shareholders, I express my deepest gratitude to our people. I am proud to be their partner.

Jamie Dimon
Chairman and Chief Executive Officer

March 26, 2010

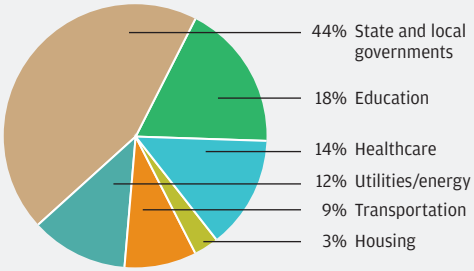
Investment Bank



Across our business, our goal is to help clients succeed, contribute to orderly and well-functioning markets, and support global economic growth. One of the most important functions we serve is extending credit to companies to help them grow.

J.P. Morgan is a leading global investment bank with one of the largest client bases in the world. We serve more than 20,000 clients, including corporations, governments, states, municipalities, healthcare organizations, educational institutions, banks and investors. Our clients operate in more than 100 countries. We offer a complete range of financial services to help clients achieve their goals. We provide strategic advice, lend money, raise capital, help manage risk, make markets and extend liquidity, and we hold global leadership positions in all of our major business lines.

2009 HIGHLIGHTS AND ACCOMPLISHMENTS



- Delivered record net income of $6.9 billion on record revenue of $28.1 billion, led by record Global Markets revenue of $22 billion and record reported IB fees of $7.2 billion.
- Earned a return on equity of 21% on $33 billion of average allocated capital.
- As the market leader, arranged and raised $204 billion in corporate loans for 295 issuer clients globally.[a] The average size of loans led by J.P. Morgan was roughly $691 million, more than double the market's average size of $316 million.

Average corporate loan size:
J.P. Morgan deals vs. industry average[a]
(in millions)

- Helped clients issue $620 billion of stocks and bonds, $170 billion more than any other bank in the world.[a] As the top underwriter in each category, J.P. Morgan raised $105 billion and $515 billion in the global equity and debt markets, respectively.[a] Excluding self-led bank deals, J.P. Morgan was a lead underwriter on eight of the 10 largest transactions in both the equity and debt markets.
- Arranged and raised $178 billion of capital for banks and financial institutions around the world; that amounts to nearly 10% of the capital raised in 2009 to restore the global banking system to health.[a]
- Advised clients on 322 mergers and acquisitions globally, more than any other bank.[a] In fact, J.P. Morgan acted as advisor on 11 of the year's largest 25 deals[a], including advising on the year's largest deal, Pfizer's acquisition of Wyeth, and serving as sole advisor to ExxonMobil on its acquisition of XTO Energy. J.P. Morgan also advised on 119 cross-border deals, more than any other bank.[a]
- In the U.S., helped raise approximately $102 billion, including $19 billion of extended credit, for state and local governments, healthcare organizations and educational institutions, to help build local infrastructure, improve social services, expand universities and hospitals, and fund medical research. In addition, committed to provide financing urgently needed to fund cash flow shortfalls, including $4 billion to the state of California and $2 billion to the state of New Jersey.

J.P. Morgan helped raise $102 billion for governments, public sector organizations and institutions

- Invested in renewable energy projects, including 58 wind farms across 16 U.S. states, as well as in environmentally responsible companies; in 2009, J.P. Morgan acquired EcoSecurities, a leader in sourcing and developing emission reduction credits.

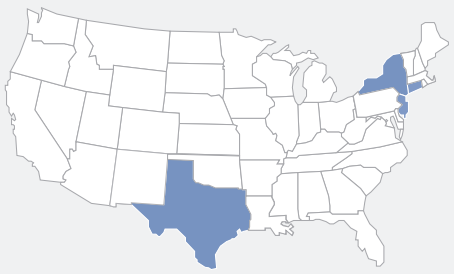
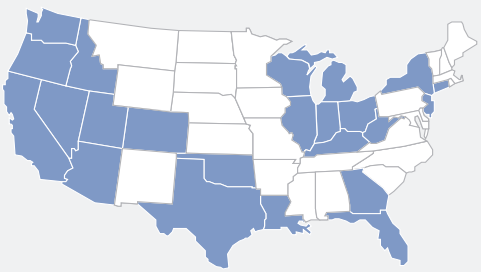
Retail Financial Services

Our bankers work with consumers and small business owners to meet everyday financial needs and to pursue lifetime dreams. They can use an ATM, debit card or credit card, save, pay bills, borrow for a car, a home, a business expansion or college, and invest for a well-earned retirement.



Retail Financial Services serves consumers and businesses through personal service at branches, through ATMs and online, mobile and telephone banking, and through retail mortgage correspondents, auto dealerships and school financial aid offices.

Customers can use more than 5,100 bank branches (third largest nationally) and 15,400 ATMs (second largest nationally), as well as online and mobile banking around the clock. Nearly 24,000 personal bankers and specialists assist customers with checking and savings accounts, mortgages, business loans and investments across the 23-state footprint from New York and Florida to California. Consumers also can obtain loans through more than 15,700 auto dealerships and nearly 2,100 schools and universities nationwide.



2009 HIGHLIGHTS AND ACCOMPLISHMENTS

- Provided customers full access to 5,154 bank branches in 23 states after converting the computer systems in 1,800 Washington Mutual branches and rebranding them Chase.
- Added 2,400 personal bankers, business bankers, investment specialists and mortgage officers in bank branches to serve customers better.
- Increased in-branch sales of mortgages by 84%, investments by 23% and credit cards by 3%.
- Expanded convenience for Chase customers by opening 117 new branches.
- Increased the total number of checking accounts 5% to 26 million.
- Added more than 800 ATMs and made nearly 4,300 additional ATMs deposit-friendly by eliminating envelopes and providing images of deposited checks on the screen and on receipts.
- Expanded mobile banking capabilities by adding iPhone applications.
- Generated Retail Banking revenue of $18 billion, up 42% from 2008.
- Originated $150.7 billion of mortgage loans to help families to lower their payments by refinancing or to purchase a home.
- Offered nearly 600,000 mortgage modifications in an unprecedented initiative to help struggling homeowners stay in their homes.
- Opened 34 face-to-face loan-counseling centers – with 17 more opening in early 2010 – and sent counselors to 388 public reach-out events.
- Originated $23.7 billion of auto financing to become the largest U.S. auto lender while maintaining disciplined underwriting.

Chase has expanded its network from 540 branches in four states in early 2004 to more than 5,100 branches in 23 states by the end of 2009 to serve customers better

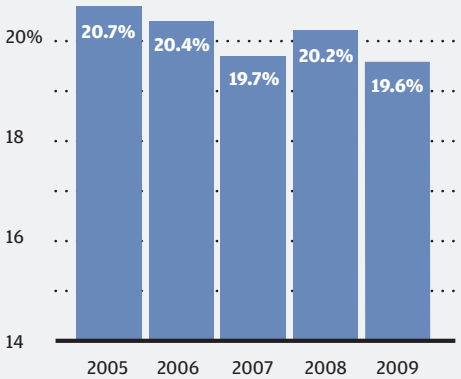
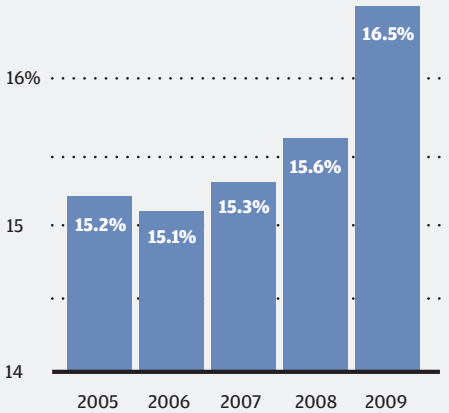
Card Services

We deliver products and services that meet both the spending and borrowing needs of our more than 50 million customers in the U.S. In addition to offering industry-leading products through the Chase brand, we are one of the largest issuers of co-brand credit cards, partnering with many of the world's most prominent brands.



Card Services is one of the nation's largest credit card issuers, with more than 145 million credit cards in circulation and over $163 billion in managed loans. Customers used Chase cards to meet more than $328 billion of their spending needs in 2009.

Chase continues to innovate despite a very difficult business environment, launching new products and services, such as Blueprint℠, Ultimate Rewards℠, Chase Sapphire℠ and Ink℠ from Chase, and earning a market leadership position in building loyalty and rewards programs. Through its merchant acquiring business, Chase Paymentech Solutions, Chase is one of the leading processors of credit card payments.



2009 HIGHLIGHTS AND ACCOMPLISHMENTS

- Added 10.2 million new Visa, MasterCard and private label credit card accounts.
- Launched Blueprint℠, an innovative feature that allows customers to have more control of their spending and borrowing. Blueprint℠ is designed to help customers pay down balances, manage everyday spending and pay off major purchases.
- Invested in activities – such as the launch of Ultimate Rewards℠, a new rewards platform for Chase's proprietary credit cards – designed to attract new customers and further engage current cardmembers.
- Introduced Chase Sapphire℠, a new rewards product designed for affluent cardholders.
- Launched Ink℠ from Chase, a new product suite of cards for small business owners.
- Successfully completed the conversion of the Washington Mutual credit card portfolio to the Chase platform.
- Continued improvements in risk management, customer satisfaction, and systems and infrastructure.
- Processed 18 billion transactions through Chase Paymentech Solutions.

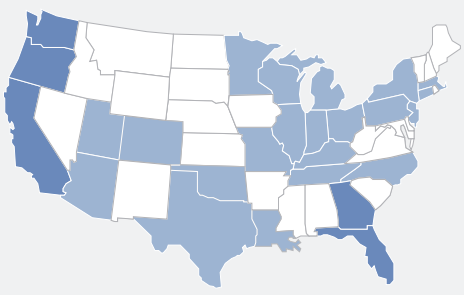
Commercial Banking

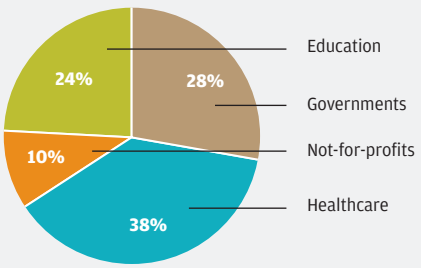
With offices in more than 100 U.S. cities and eight countries around the world, we are a stable and dependable local banking partner with access to global financial solutions. Our bankers build long-term relationships to help our clients succeed by supporting their lending, treasury, investment banking and asset management needs.



Commercial Banking serves nearly 25,000 clients nationally, including corporations, municipalities, financial institutions and not-for-profit entities with annual revenue generally ranging from $10 million to $2 billion, and more than 30,000 real estate investors/owners.

Delivering extensive industry knowledge, local expertise and dedicated service, Commercial Banking partners with the firm's other businesses to provide comprehensive solutions, including lending, treasury services, investment banking and asset management, to meet its clients' domestic and international financial needs.

2009 HIGHLIGHTS AND ACCOMPLISHMENTS



- Maintained Top 3 leadership position nationally in market penetration and lead share.(a)
- Ranked #1 multi-family lender(b) and #2 asset-based lead left arranger.(c)
- Delivered more than $1 billion in gross investment banking fees.
- Increased revenue by 20% to a record $5.7 billion.
- Improved operating margin by 25% to $3.5 billion on record revenue and continued focus on expense management.
- Delivered a double-digit increase in average liability balances, up 10%.
- Added in excess of 1,700 new clients and expanded more than 7,600 existing relationships.
- Expanded into five additional states across the United States with local middle market bankers delivering complete lending and treasury solutions.
- Demonstrated credit and risk management discipline with an allowance coverage ratio of more than 3% of retained loans and a decrease of more than 12% in real estate exposure.
- Achieved the second lowest nonperforming loan ratio in our peer group.
- Experienced online banking revenue growth of nearly 10% and remote deposit volume of nearly $6 billion.
- Recognized for our commitment to fiscal responsibility by earning a 2009 National Greenwich Excellence Award for Financial Stability in Middle Market Banking.(d)
- Successfully completed the conversion of Washington Mutual clients' commercial accounts onto Chase platforms.
- Continued to support communities by extending nearly $8 billion in new financing to more than 500 government entities, healthcare companies, educational institutions and not-for-profit organizations.

Commercial Banking serves nearly 25,000 clients in 26 states across the country

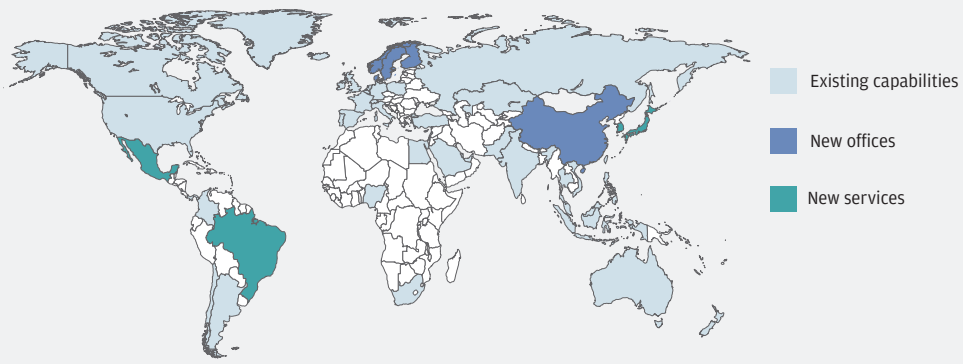
Treasury & Securities Services

We actively work with clients on a global basis to fully optimize their working capital, manage their collateral and help mitigate their risk effectively.

J.P. Morgan's Treasury & Securities Services division is a global leader in transaction, investment and information services. We are one of the world's largest cash management providers, processing a market-leading average of $3.1 trillion in U.S. dollar transfers daily, as well as a leading global custodian with $14.9 trillion in assets under custody. We operate through two divisions:



Treasury Services provides cash management, trade, wholesale card and liquidity products and services to small- and mid-sized companies, multinational corporations, financial institutions and government entities.

Worldwide Securities Services holds, values, clears and services securities, cash and alternative investments for investors and broker-dealers and manages depositary receipt programs globally.

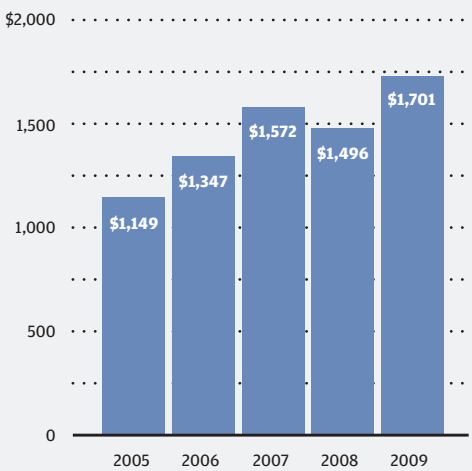
2009 HIGHLIGHTS AND ACCOMPLISHMENTS

- Continued strong underlying growth in the following key business drivers: international electronic funds transfer volumes grew 13%, assets under custody grew 13% and the number of wholesale cards issued grew 19%.
- Received more than 100 industry awards and top rankings, including Securities Lending Manager of the Year (*Global Pensions*), Best Overall Hedge Fund Administrator (*HFMWeek*), Pension Fund Custodian of the Year (*ICFA* magazine), Fund Administrator of the Year: Europe (*ICFA* magazine), Best Depositary Receipt Bank (*The Asset*), Best Overall Bank for Cash Management: North America (*Global Finance*), Best Liquidity Solutions Provider (*The Asset*), Best Global Cash Management Services in Asia Pacific (*Asiamoney*) and many others.
- The only financial institution invited by the U.S. Department of the Treasury's Financial Management Service (FMS) and the Department of Defense to participate in a series of meetings in the U.S., Kuwait and Afghanistan to assist FMS and the U.S. Army toward implementing a prepaid card program that would not only help U.S. troops but also benefit the local population in Afghanistan.
- Strengthened our international presence: Opened branches in China, Denmark, Finland, Norway and Sweden; launched services in Tokyo, South Korea, Brazil and Mexico; and expanded capabilities in Australia, India, Europe, the Middle East and Africa.
- Acquired ANZ's Custodian Services business, including access to more than 100 clients and AUD99 billion in assets under custody, further strengthening our position as one of the leading providers of third-party custodial services in the Australian and New Zealand marketplace.
- Remained the #1 clearer of U.S. dollars in the world and have been #1 in Automated Clearing House originations for the past 34 years.
- Announced the formation of the Prime-Custody Solutions Group, a team responsible for delivering the firm's integrated prime brokerage and custody platform to clients.
- Led depositary receipt initial public offering (IPO) capital raising with a 77% market share and three of the five largest IPOs of the year, including landmark deals from both Brazil and China.

We expanded our global footprint to better serve clients around the world

Asset Management

Our business has been built upon our core principle of putting our clients' interests first. Inherent in that commitment is a fiduciary responsibility of successfully managing our clients' assets – which is the foundation of what we do – every minute of every day.



Asset Management, with assets under supervision of $1.7 trillion, is a global leader in investment and wealth management.

Asset Management clients include institutions, retail investors and high-net-worth individuals in every major market throughout the world. Asset Management offers its clients global investment management in equities, fixed income, real estate, hedge funds, private equity and liquidity, including money market instruments and bank deposits. Asset Management also provides trust and estate, banking and brokerage services to high-net-worth clients and retirement services to corporations and individuals. The majority of Asset Management's client assets are in actively managed portfolios.

2009 HIGHLIGHTS AND ACCOMPLISHMENTS

- As the #1 money market fund manager in the world, managed more than $500 billion in global liquidity assets on behalf of clients. In 2009, the J.P. Morgan US Dollar Liquidity Fund became the largest mutual fund in Europe and the first of its kind to reach $100 billion in assets.
- Achieved record revenue of $2.6 billion in the Private Bank led by strong brokerage activity as we put timely, innovative investment opportunities to work for clients.
- Provided clients with superior risk-adjusted returns. The percentage of global long-term mutual fund assets under management in the first or second quartiles was 74% for the five-year period and 62% for the three-year period ended December 31, 2009.
- Ranked third in long-term U.S. mutual fund flows as retail investors sought the stability and performance of J.P. Morgan Funds.

Assets under supervision
(in billions)

- Ranked #4 U.S. Mutual Fund Family based on investment performance over five-year period.(a)
- Expanded Private Wealth Management into five new markets: Miami, Philadelphia, San Francisco, Seattle and Washington, D.C.
- Granted more than $100 million to charities throughout the world on behalf of Private Bank fiduciary clients.
- *Euromoney* rated the Private Bank as the top private bank for ultra-high-net-worth clients globally.
- China International Fund Management, the joint venture between J.P. Morgan Asset Management and Shanghai International Trust & Investment Co., was named the best overall performing foreign asset manager operating in China by a PricewaterhouseCoopers survey.
- Received the Gold Standard Award for Funds Management in the United Kingdom for the seventh year in a row from leading publishing house Incisive Media.
- Named Asset Management Company of the Year in Asia and Hong Kong by *The Asset* magazine.
- Completed the acquisition of Highbridge Capital Management. In 2009, Highbridge clients experienced the best investment performance in its 17-year operating history. Since the formation of the partnership in 2004, client assets under management have grown threefold.

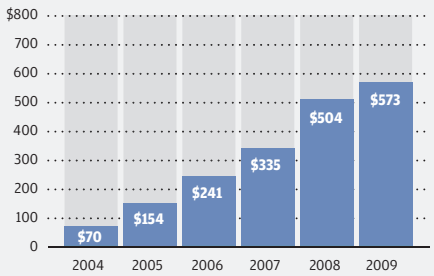
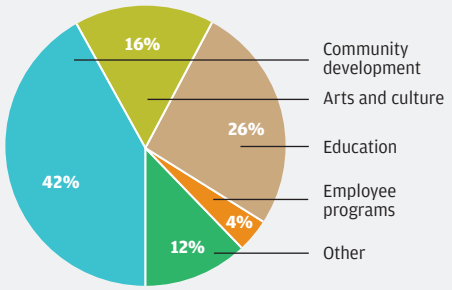
Corporate Responsibility



We do our best to manage and operate our company with a consistent set of business principles and core values. First and foremost, this means always trying to do the right thing.

At JPMorgan Chase, corporate responsibility is about what we do every day in our businesses and how we do it. We are committed to managing our businesses to create value for our consumer, small business and corporate clients, as well as our shareholders, communities and employees, and to being a responsible corporate citizen.

2009 HIGHLIGHTS AND ACCOMPLISHMENTS



- Invested more than $573 billion in low- and moderate-income families and communities in the first six years of our 10-year, $800 billion Community Development commitment and also earned the highest possible rating of Outstanding in our latest Community Reinvestment Act examination.

First six years of cumulative spend of our 10-year, $800 billion commitment to invest in low- and moderate-income families and communities
(in billions)

- Provided in excess of $690 million in financing for the construction or preservation of more than 5,500 units of affordable housing and made investments in low-income communities through our New Markets Tax Credits. Recognized leader in supporting community development financial institutions.
- Demonstrated our support for impact investing through our principal investment and placements activity in the microfinance sector, through our research on microfinance issues, and as a founding sponsor of the Global Impact Investing Network. Expanded commitment to Grameen Foundation's Bankers without Borders®, an innovative program bringing private sector talent to the microfinance sector.
- Launched the innovative philanthropic campaign, Chase Community Giving, engaging more than 2 million Facebook users in helping to direct over $5 million to small and local charities.
- Strategically contributed more than $100 million in high-need neighborhoods across the globe while supporting thousands of not-for-profits charged with strengthening the communities we serve. Multiplied the impact of our philanthropic investments through active partnership with employee volunteers, community leaders, and other private and public funders.

*2009 charitable contributions**

* Percentages include charitable giving from JPMorgan Chase & Co. and the JPMorgan Chase Foundation

- Continued energy efficiency programs to meet our 20% greenhouse gas reduction target. Bought 100,000 carbon credits to offset emissions from employee air travel. Increased number of branches built to smart and responsible construction practices to more than 90, including 13 LEED certified branches. Significantly increased procurement of paper from certified responsibly managed sources from 8% of total volume to over 69% and continued efforts to eliminate paper statements across the firm.
- Reviewed more than 180 financial transactions to determine and, where possible, mitigate adverse environmental and social impacts.
- Maintained more than $1 billion in annual spend with diverse suppliers despite a reduction in firmwide spend.

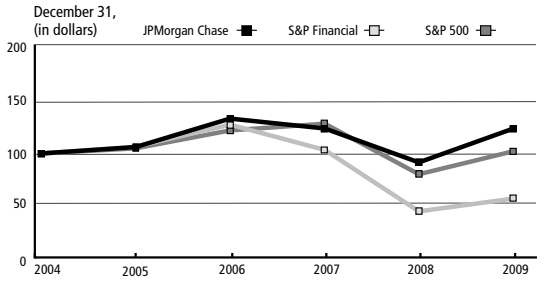
Headcount	**222,316**	224,961	180,667	174,360	168,847



(a) Pre-provision profit is total net revenue less noninterest expense. The Firm believes that this financial measure is useful in assessing the ability of a lending institution to generate income in excess of its provision for credit losses.
(b) Results for 2008 included an accounting conformity loan loss reserve provision related to the acquisition of Washington Mutual Bank's banking operations.
(c) On October 1, 2006, JPMorgan Chase & Co. completed the exchange of selected corporate trust businesses for the consumer, business banking and middle-market banking businesses of The Bank of New York Company Inc. The results of operations of these corporate trust businesses are being reported as discontinued operations for each of the periods presented.
(d) On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual. On May 30, 2008, a wholly-owned subsidiary of JPMorgan Chase merged with and into The Bear Stearns Companies Inc. ("Bear Stearns"), and Bear Stearns became a wholly-owned subsidiary of JPMorgan Chase. The Washington Mutual acquisition resulted in negative goodwill, and accordingly, the Firm recorded an extraordinary gain. For additional information on these transactions, see Note 2 on pages 151–156 of this Annual Report.
(e) Effective January 1, 2009, the Firm implemented new FASB guidance for participating securities. Accordingly, prior-period amounts have been revised as required. For further discussion of the guidance, see Note 25 on page 232 of this Annual Report.
(f) The calculation of 2009 earnings per share and net income applicable to common equity include a one-time, noncash reduction of $1.1 billion, or $0.27 per share, resulting from repayment of U.S. Troubled Asset Relief Program ("TARP") preferred capital in the second quarter of 2009. Excluding this reduction, the adjusted ROE and ROTCE were 7% and 11% for 2009. For further discussion, see "Explanation and reconciliation of the Firm's use of non-GAAP financial measures" on pages 58–60 of this Annual Report.
(g) For further discussion of ROTCE, a non-GAAP financial measure, see "Explanation and reconciliation of the Firm's use of non-GAAP financial measures" on pages 58–60 of this Annual Report.
(h) Tier 1 common is calculated as Tier 1 capital less qualifying perpetual preferred stock, qualifying trust preferred securities and qualifying minority interest in subsidiaries. The Firm uses the Tier 1 common capital ratio, a non-GAAP financial measure, to assess and compare the quality and composition of the Firm's capital with the capital of other financial services companies. For further discussion, see Regulatory capital on pages 90–92 of this Annual Report.

FIVE-YEAR STOCK PERFORMANCE

The following table and graph compare the five-year cumulative total return for JPMorgan Chase & Co. ("JPMorgan Chase" or the "Firm") common stock with the cumulative return of the S&P 500 Stock Index and the S&P Financial Index. The S&P 500 Index is a commonly referenced U.S. equity benchmark consisting of leading companies from different economic sectors. The S&P Financial Index is an index of 78 financial companies, all of which are within the S&P 500. The Firm is a component of both industry indices.

The following table and graph assume simultaneous investments of $100 on December 31, 2004, in JPMorgan Chase common stock and in each of the above S&P indices. The comparison assumes that all dividends are reinvested.

December 31, (in dollars)	2004	2005	2006	2007	2008	**2009**
JPMorgan Chase	$100.00	$ 105.68	$ 132.54	$ 123.12	$ 91.84	**$ 123.15**
S&P Financial Index	100.00	106.48	126.91	103.27	46.14	**54.09**
S&P 500 Index	100.00	104.91	121.48	128.16	80.74	**102.11**

This section of the JPMorgan Chase's Annual Report for the year ended December 31, 2009 ("Annual Report") provides management's discussion and analysis ("MD&A") of the financial condition and results of operations of JPMorgan Chase. See the Glossary of terms on pages 251–253 for definitions of terms used throughout this Annual Report. The MD&A included in this Annual Report contains statements that are forward-looking within the meaning of the Private Securities Litigation Reform Act of 1995. Such statements are based on the current beliefs and expectations of JPMorgan Chase's management and are subject to significant risks and uncertainties. These risks and uncertainties could cause the Firm's results to differ materially from those set forth in such forward-looking statements. Certain of such risks and uncertainties are described herein (see Forward-looking statements on page 143 of this Annual Report) and in the JPMorgan Chase Annual Report on Form 10-K for the year ended December 31, 2009 ("2009 Form 10-K"), in Part I, Item 1A: Risk factors, to which reference is hereby made.

INTRODUCTION

JPMorgan Chase & Co., a financial holding company incorporated under Delaware law in 1968, is a leading global financial services firm and one of the largest banking institutions in the United States of America ("U.S."), with $2.0 trillion in assets, $165.4 billion in stockholders' equity and operations in more than 60 countries as of December 31, 2009. The Firm is a leader in investment banking, financial services for consumers and businesses, financial transaction processing and asset management. Under the J.P. Morgan and Chase brands, the Firm serves millions of customers in the U.S. and many of the world's most prominent corporate, institutional and government clients.

JPMorgan Chase's principal bank subsidiaries are JPMorgan Chase Bank, National Association ("JPMorgan Chase Bank, N.A."), a national bank with branches in 23 states in the U.S.; and Chase Bank USA, National Association ("Chase Bank USA, N.A."), a national bank that is the Firm's credit card issuing bank. JPMorgan Chase's principal nonbank subsidiary is J.P. Morgan Securities Inc., the Firm's U.S. investment banking firm.

JPMorgan Chase's activities are organized, for management reporting purposes, into six business segments, as well as Corporate/Private Equity. The Firm's wholesale businesses comprise the Investment Bank, Commercial Banking, Treasury & Securities Services and Asset Management segments. The Firm's consumer businesses comprise the Retail Financial Services and Card Services segments. A description of the Firm's business segments, and the products and services they provide to their respective client bases, follows.

Investment Bank

J.P. Morgan is one of the world's leading investment banks, with deep client relationships and broad product capabilities. The clients of the Investment Bank ("IB") are corporations, financial institutions, governments and institutional investors. The Firm offers a full range of investment banking products and services in all major capital markets, including advising on corporate strategy and structure, capital-raising in equity and debt markets, sophisticated risk management, market-making in cash securities and derivative instruments, prime brokerage, and research. IB also commits the Firm's own capital to principal investing and trading activities on a limited basis.

Retail Financial Services

Retail Financial Services ("RFS"), which includes the Retail Banking and Consumer Lending businesses, serves consumers and businesses through personal service at bank branches and through ATMs, online banking and telephone banking, as well as through auto dealerships and school financial-aid offices. Customers can use more than 5,100 bank branches (third-largest nationally) and 15,400 ATMs (second-largest nationally), as well as online and mobile banking around the clock. More than 23,900 branch salespeople assist customers with checking and savings accounts, mortgages, home equity and business loans, and investments across the 23-state footprint from New York and Florida to California. Consumers also can obtain loans through more than 15,700 auto dealerships and nearly 2,100 schools and universities nationwide.

Card Services
Card Services ("CS") is one of the nation's largest credit card issuers, with more than 145 million credit cards in circulation and over $163 billion in managed loans. Customers used Chase cards to meet more than $328 billion of their spending needs in 2009.

Chase continues to innovate, despite a very difficult business environment, launching new products and services such as Blueprint, Ultimate Rewards, Chase Sapphire and Ink from Chase, and earning a market leadership position in building loyalty and rewards programs. Through its merchant acquiring business, Chase Paymentech Solutions, Chase is one of the leading processors of credit-card payments.

Commercial Banking
Commercial Banking ("CB") serves nearly 25,000 clients nationally, including corporations, municipalities, financial institutions and not-for-profit entities with annual revenue generally ranging from $10 million to $2 billion, and more than 30,000 real estate investors/owners. Delivering extensive industry knowledge, local expertise and dedicated service, CB partners with the Firm's other businesses to provide comprehensive solutions, including lending, treasury services, investment banking and asset management to meet its clients' domestic and international financial needs.

Treasury & Securities Services
Treasury & Securities Services ("TSS") is a global leader in transaction, investment and information services. TSS is one of the world's largest cash management providers and a leading global custodian. Treasury Services ("TS") provides cash management, trade, wholesale card and liquidity products and services to small and mid-sized companies, multinational corporations, financial institutions and government entities. TS partners with the Commercial Banking, Retail Financial Services and Asset Management businesses to serve clients firmwide. As a result, certain TS revenue is included in other segments' results. Worldwide Securities Services holds, values, clears and services securities, cash and alternative investments for investors and broker-dealers, and it manages depositary receipt programs globally.

Asset Management
Asset Management ("AM"), with assets under supervision of $1.7 trillion, is a global leader in investment and wealth management. AM clients include institutions, retail investors and high-net-worth individuals in every major market throughout the world. AM offers global investment management in equities, fixed income, real estate, hedge funds, private equity and liquidity products, including money-market instruments and bank deposits. AM also provides trust and estate, banking and brokerage services to high-net-worth clients, and retirement services for corporations and individuals. The majority of AM's client assets are in actively managed portfolios.

This executive overview of management's discussion and analysis highlights selected information and may not contain all of the information that is important to readers of this Annual Report. For a complete description of events, trends and uncertainties, as well as the capital, liquidity, credit, operational and market risks and the critical accounting estimates affecting the Firm and its various lines of business, this Annual Report should be read in its entirety.

Business overview

JPMorgan Chase reported 2009 net income of $11.7 billion, or $2.26 per share, compared with net income of $5.6 billion, or $1.35 per share, in 2008. Total net revenue in 2009 was $100.4 billion, compared with $67.3 billion in 2008. Return on common equity was 6% in 2009 and 4% in 2008. Results benefited from the impact of the acquisition of the banking operations of Washington Mutual Bank ("Washington Mutual") on September 25, 2008, and the impact of the merger with The Bear Stearns Companies Inc. ("Bear Stearns") on May 30, 2008.

The increase in net income for the year was driven by record net revenue, including record revenue in the Investment Bank reflecting modest net gains on legacy leveraged-lending and mortgage-related positions compared with net markdowns in the prior year. Partially offsetting the growth in the Firm's revenue was an increase in the provision for credit losses, driven by an increase in the consumer provision, and higher noninterest expense reflecting the impact of the Washington Mutual transaction.

The business environment in 2009 gradually improved throughout the year. The year began with a continuation of the weak conditions experienced in 2008 – the global economy contracted sharply in the first quarter, labor markets deteriorated rapidly and unemployment rose, credit was tight, liquidity was diminished, and businesses continued to downsize and cut inventory levels rapidly. Throughout the year, the Board of Governors of the Federal Reserve System ("Federal Reserve") took actions to stabilize the financial markets and promote an economic revival. It held its policy rate close to zero and indicated that this policy was likely to remain in place for some time, given economic conditions. In addition, it greatly expanded a program it launched at the end of 2008, with a plan to buy up to $1.7 trillion of securities, including Treasury securities, mortgage-backed securities and obligations of government-sponsored agencies. The U.S. government and various regulators continued their efforts to stabilize the U.S. economy, putting in place a financial rescue plan that supplemented the interest rate and other actions that had been taken by the Federal Reserve and the U.S. Department of the Treasury (the "U.S. Treasury") in the second half of 2008. These efforts began to take effect during 2009. Developing economies rebounded significantly and contraction in developed economies slowed. Credit conditions improved in the summer, with most credit spreads narrowing dramatically. By the third quarter of the year, many spreads had returned to pre-crisis levels. By the fourth quarter, economic activity was expanding and signs emerged that the deterioration in the labor market was abating, although by the end of the year unemployment reached 10%, its highest level since 1983. The housing sector showed some signs of improvement and household spending appeared to be expanding at a moderate rate, though it remained constrained by a weak labor market, modest income growth, lower housing wealth, and tight credit. Businesses were continuing to reduce capital investment, though at a slower pace, and remained reluctant to add to payrolls. Financial market conditions in the fourth quarter became more supportive of economic growth.

Amidst this difficult operating environment, JPMorgan Chase benefited from the diversity of its leading franchises, as demonstrated by the continued earnings strength of its Investment Bank, Commercial Banking, Asset Management, and Retail Banking franchises. Significant market share and efficiency gains helped all of the Firm's businesses maintain leadership positions: the Investment Bank ranked #1 for Global Investment Banking fees for 2009; in Commercial Banking, at year-end 2009, the total revenue related to investment banking products sold to CB clients doubled from its level at the time of the JPMorgan Chase–Bank One merger. In addition, the Firm completed the integration of Washington Mutual and continued to invest in its businesses, demonstrated by growth in checking and credit card accounts.

Throughout 2009, the Firm remained focused on maintaining a strong balance sheet. In addition to the capital generated from earnings, the Firm issued $5.8 billion of common stock and reduced its quarterly dividend. The Firm also increased its consumer allowance for credit losses by $7.8 billion, bringing the total allowance for credit losses to $32.5 billion, or 5.5% of total loans. The Firm recorded a $1.1 billion one-time noncash adjustment to common stockholders' equity related to the redemption of the $25.0 billion of Series K Preferred Stock issued to the U.S. Treasury under the Capital Purchase Program. Even with this adjustment, the

Firm ended 2009 with a very strong Tier 1 Capital ratio of 11.1% and a Tier 1 Common ratio of 8.8%.

Throughout this turbulent financial period, JPMorgan Chase supported and served its 90 million customers and the communities in which it operates; delivered consumer-friendly products and policies; and continued to lend. The Firm extended nearly $250 billion in new credit to consumers during the year and for its corporate and municipal clients, either lent or assisted them in raising approximately $1 trillion in loans, stocks or bonds. The Firm also remained committed to helping homeowners meet the challenges of declining home prices and rising unemployment. Since 2007, the Firm has initiated over 900,000 actions to prevent foreclosures through its own programs and through government mortgage-modification programs. During 2009 alone, JPMorgan Chase offered approximately 600,000 loan modifications to struggling homeowners. Of these, 89,000 loans have achieved permanent modification. By March 31, 2010, the Firm will have opened 51 Chase Homeownership Centers across the country and already has over 14,000 employees dedicated to mortgage loss mitigation.

Management remains confident that JPMorgan Chase's capital and reserve strength, combined with its significant earnings power, will allow the Firm to meet the uncertainties that lie ahead and still continue investing in its businesses and serving its clients and shareholders over the long term.

The discussion that follows highlights the performance of each business segment compared with the prior year and presents results on a managed basis unless otherwise noted. For more information about managed basis, see Explanation and Reconciliation of the Firm's Use of Non-GAAP Financial Measures on pages 58–60 of this Annual Report.

Investment Bank reported record net income in 2009 compared with a net loss in 2008. The significant rebound in earnings was driven by record net revenue, partially offset by increases in both noninterest expense and the provision for credit losses. The increase in net revenue was driven by record Fixed Income Markets revenue, reflecting strong results across most products, as well as modest net gains on legacy leveraged lending and mortgage-related positions, compared with over $10 billion of net markdowns in the prior year. Investment banking fees rose to record levels, as higher equity and debt underwriting fees were partially offset by lower advisory fees. Record Equity Markets revenue was driven by solid client revenue, particularly in prime services, and strong trading results. The net revenue results for IB in 2009 included losses from the tightening of the Firm's credit spread on certain structured liabilities and derivatives, compared with gains in 2008 from the widening of the spread on those liabilities. The provision for credit losses increased, driven by continued weakness in the credit environment. IB ended the year with a ratio of allowance for loan losses to end-of-period loans retained of 8.25%. Noninterest expense increased, reflecting higher performance-based compensation offset partially by lower headcount-related expense.

Retail Financial Services net income decreased from the prior year, as an increase in the provision for credit losses and higher noninterest expense were predominantly offset by double-digit growth in net revenue. Higher net revenue reflected the impact of the Washington Mutual transaction, wider loan and deposit spreads, and higher net mortgage servicing revenue. The provision for credit losses increased from the prior year as weak economic conditions and housing price declines continued to drive higher estimated losses for the home equity and mortgage loan portfolios. RFS ended the year with a ratio of allowance for loan losses to ending loans, excluding purchased credit-impaired loans of 5.09%. Noninterest expense was higher, reflecting the impact of the Washington Mutual transaction and higher servicing and default-related expense.

Card Services reported a net loss for the year, compared with net income in 2008. The decline was driven by a significantly higher provision for credit losses, partially offset by higher net revenue. The double-digit growth in managed net revenue was driven by the impact of the Washington Mutual transaction, wider loan spreads and higher merchant servicing revenue related to the dissolution of the Chase Paymentech Solutions joint venture; these were partially offset by higher revenue reversals associated with higher charge-offs, a decreased level of fees and lower average loan balances. The provision for credit losses increased, reflecting continued weakness in the credit environment. CS ended the year with a ratio of allowance for loan losses to end-of-period loans of 12.28%. Noninterest expense increased due to the dissolution of the Chase Paymentech Solutions joint venture and the impact of the Washington Mutual transaction, partially offset by lower marketing expense.

Commercial Banking net income decreased from 2008, as an increase in provision for credit losses and higher noninterest expense were predominantly offset by higher net revenue. Double-digit growth in net revenue reflected the impact of the Washington Mutual transaction and record levels of lending- and deposit-related and investment banking fees. Revenue rose in all business segments: Middle Market Banking, Commercial Term Lending, Mid-Corporate Banking and Real Estate Banking. The provision for credit losses increased, reflecting continued weakness throughout the year in the credit environment across all business segments, predominantly in real estate–related segments. CB ended the year with a ratio of allowance for loan losses to end-of-period loans retained of 3.12%. Noninterest expense increased due to the impact of the Washington Mutual transaction and higher Federal Deposit Insurance Corporation ("FDIC") insurance premiums.

Treasury & Securities Services net income declined from the prior year, driven by lower net revenue. The decrease in net revenue reflected lower Worldwide Securities Services net revenue, driven by lower balances and spreads on liability products; lower securities lending balances, primarily as a result of declines in asset valuations and demand; and the effect of market depreciation on certain custody assets. Treasury Services net revenue also declined, reflecting lower deposit balances and spreads, offset by higher trade revenue driven by wider spreads and growth across cash management and card product volumes. Noninterest expense rose slightly compared with the prior year, reflecting higher FDIC insurance premiums offset by lower headcount-related expense.

Asset Management net income increased from the prior year, due to higher net revenue, offset largely by higher noninterest expense and a higher provision for credit losses. The increase in net revenue reflected higher valuations of the Firm's seed capital investments, net inflows, wider loan spreads and higher deposit balances, offset partially by the effect of lower market levels and narrower deposit spreads. Asset Management's businesses reported mixed revenue results: Institutional and Private Bank revenue were up while Retail and Private Wealth Management revenue were down. Assets under supervision increased for the year, due to the effect of higher market valuations and inflows in fixed income and equity products offset partially by outflows in cash products. The provision for credit losses increased compared with the prior year, reflecting continued weakness in the credit environment. Noninterest expense was higher, reflecting the effect of the Bear Stearns merger, higher performance-based compensation and higher FDIC insurance premiums, offset largely by lower headcount-related expense.

Corporate/Private Equity net income increased in 2009, reflecting elevated levels of trading gains and net interest income, securities gains, an after-tax gain from the sale of MasterCard shares and reduced losses from Private Equity compared with 2008. Trading gains and net interest income increased due to the Firm's significant purchases of mortgage-backed securities guaranteed by U.S. government agencies, corporate debt securities, U.S. Treasury and government agency securities and other asset-backed securities. These investments were generally associated with the Chief Investment Office's management of interest rate risk and investment of cash resulting from the excess funding the Firm continued to experience during 2009. The increase in securities was partially offset by sales of higher-coupon instruments (part of repositioning the investment portfolio) as well as prepayments and maturities.

Firmwide, the managed provision for credit losses was $38.5 billion, up by $13.9 billion, or 56%, from the prior year. The prior year included a $1.5 billion charge to conform Washington Mutual's allowance for loan losses, which affected both the consumer and wholesale portfolios. For the purposes of the following analysis, this charge is excluded. The consumer-managed provision for credit losses was $34.5 billion, compared with $20.4 billion in the prior year, reflecting an increase in the allowance for credit losses in the home lending and credit card loan portfolios. Consumer-managed net charge-offs were $26.3 billion, compared with $13.0 billion in the prior year, resulting in managed net charge-off rates of 5.85% and 3.22%, respectively. The wholesale provision for credit losses was $4.0 billion, compared with $2.7 billion in the prior year, reflecting continued weakness in the credit environment throughout 2009. Wholesale net charge-offs were $3.1 billion, compared with $402 million in the prior year, resulting in net charge-off rates of 1.40% and 0.18%, respectively. The Firm's nonperforming assets totaled $19.7 billion at December 31, 2009, up from $12.7 billion. The total allowance for credit losses increased by $8.7 billion from the prior year-end, resulting in a loan loss coverage ratio at December 31, 2009, of 5.51%, compared with 3.62% at December 31, 2008.

Total stockholders' equity at December 31, 2009, was $165.4 billion.

2010 Business outlook

The following forward-looking statements are based on the current beliefs and expectations of JPMorgan Chase's management and are subject to significant risks and uncertainties. These risks and uncertainties could cause the Firm's actual results to differ materially from those set forth in such forward-looking statements.

JPMorgan Chase's outlook for 2010 should be viewed against the backdrop of the global and U.S. economies, financial markets activity, the geopolitical environment, the competitive environment and client activity levels. Each of these linked factors will affect the performance of the Firm and its lines of business. The Firm continues to monitor the U.S. and international economies and political environments. The outlook for capital markets remains uncertain, and further declines in U.S. housing prices in certain markets and increases in the unemployment rate, either of which could adversely affect the Firm's financial results, are possible. In addition, as a result of recent market conditions, the U.S. Congress and regulators have increased their focus on the regulation of financial institutions; any legislation or regulations that may be adopted as a result could limit or restrict the Firm's operations, and could impose additional costs on the Firm in order to comply with such new laws or rules.

Given the potential stress on consumers from rising unemployment and continued downward pressure on housing prices, management remains cautious with respect to the credit outlook for the consumer loan portfolios. Possible continued weakness in credit trends could result in higher credit costs and require additions to the consumer allowance for credit losses. Based on management's current economic outlook, quarterly net charge-offs could reach $1.4 billion for the home equity portfolio, $600 million for the prime mortgage portfolio and $500 million for the subprime mortgage portfolio over the next several quarters. The managed net charge-off rate for Card Services (excluding the Washington Mutual credit card portfolio) could approach 11% by the first quarter of 2010, including the adverse timing effect of a payment holiday program of approximately 60 basis points. The managed net charge-off rate for the Washington Mutual credit card portfolio could approach 24% over the next several quarters. These charge-off rates are likely to move even higher if the economic environment deteriorates beyond management's current expectations. Similarly, wholesale credit costs and net charge-offs could increase in the next several quarters if the credit environment deteriorates.

The Investment Bank continues to operate in an uncertain environment, and as noted above, results could be adversely affected if the credit environment were to deteriorate further. Trading results can be volatile and 2009 included elevated client volumes and spread levels. As such, management expects Fixed Income and Equity Markets revenue to normalize over time as conditions stabilize.

In the Retail Banking segment within Retail Financial Services, although management expects underlying growth, results will be under pressure from the credit environment and ongoing lower consumer spending levels. In addition, the Firm has made changes, consistent with (and in certain respects, beyond) the requirements of newly-enacted legislation, in its policies relating to non-sufficient

funds and overdraft fees. Although management estimates are, at this point in time, preliminary and subject to change, such changes are expected to result in an annualized reduction in net income of approximately $500 million, beginning in the first quarter of 2010.

In the Consumer Lending segment within Retail Financial Services, at current production and estimated run-off levels, the Home Lending portfolio of $263 billion at December 31, 2009, is expected to decline by approximately 10–15% and could possibly average approximately $240 billion in 2010 and approximately $200 billion in 2011. Based on management's preliminary estimate, which is subject to change, the effect of such a reduction in the Home Lending portfolio is expected to reduce 2010 net interest income in the portfolio by approximately $1 billion from the 2009 level. Additionally, revenue could be negatively affected by elevated levels of repurchases of mortgages previously sold to, for example, government-sponsored enterprises.

Management expects noninterest expense in Retail Financial Services to remain at or above 2009 levels, reflecting investments in new branch builds and sales force hires as well as continued elevated servicing, default and foreclosed asset related costs.

Card Services faces rising credit costs in 2010, as well as continued pressure on both charge volumes and credit card receivables growth, reflecting continued lower levels of consumer spending. In addition, as a result of the recently-enacted credit card legislation, management estimates, which are preliminary and subject to change, are that CS's annual net income may be adversely affected by approximately $500 million to $750 million. Further, management expects average Card outstandings to decline by approximately 10–15% in 2010 due to the run-off of the Washington Mutual portfolio and lower balance transfer levels. As a result of all these factors, management currently expects CS to report net losses in each of the first two quarters of 2010 (of approximately $1 billion in the first quarter and somewhat less than that in the second quarter) before the effect of any potential reserve actions. Results in the second half of 2010 will likely be dependent on the economic environment and potential reserve actions.

Commercial Banking results could be negatively affected by rising credit costs, a decline in loan demand and reduced liability balances.

Earnings in Treasury & Securities Services and Asset Management will be affected by the impact of market levels on assets under management, supervision and custody. Additionally, earnings in Treasury & Securities Services could be affected by liability balance flows.

Earnings in Private Equity (within the Corporate/Private Equity segment) will likely be volatile and continue to be influenced by capital markets activity, market levels, the performance of the broader economy and investment-specific issues. Corporate's net interest income levels and securities gains will generally trend with the size of the investment portfolio in Corporate; however, the high level of trading gains in Corporate in the second half of 2009 is not likely to continue. In the near-term, Corporate quarterly net income (excluding Private Equity, merger-related items and any significant nonrecurring items) is expected to decline to approximately $300 million, subject to the size and duration of the investment securities portfolio.

Lastly, with regard to any decision by the Firm's Board of Directors concerning any increase in the level of the common stock dividend, their determination will be subject to their judgment that the likelihood of another severe economic downturn has sufficiently diminished, that overall business performance has stabilized, and that such action is warranted taking into consideration the Firm's earnings outlook, need to maintain adequate capital levels, alternative investment opportunities, and appropriate dividend payout ratios. When in the Board's judgment, based on the foregoing, the Board believes it appropriate to increase the dividend to an annual payout level in the range of $0.75 to $1.00 per share, the Board would likely move forward with such an increase, and follow at some later time with an additional increase or additional increases sufficient to return to the Firm's historical dividend ratio of approximately 30% to 40% of normalized earnings over time.

This following section provides a comparative discussion of JPMorgan Chase's Consolidated Results of Operations on a reported basis for the three-year period ended December 31, 2009. Factors that related primarily to a single business segment are discussed in more detail within that business segment. For a discussion of the Critical Accounting Estimates Used by the Firm that affect the Consolidated Results of Operations, see pages 135–139 of this Annual Report.

Revenue

Year ended December 31, (in millions)	2009	2008	2007
Investment banking fees	**$ 7,087**	$ 5,526	$ 6,635
Principal transactions	**9,796**	(10,699)	9,015
Lending- and deposit-related fees	**7,045**	5,088	3,938
Asset management, administration and commissions	**12,540**	13,943	14,356
Securities gains	**1,110**	1,560	164
Mortgage fees and related income	**3,678**	3,467	2,118
Credit card income	**7,110**	7,419	6,911
Other income	**916**	2,169	1,829
Noninterest revenue	**49,282**	28,473	44,966
Net interest income	**51,152**	38,779	26,406
Total net revenue	**$100,434**	$ 67,252	$ 71,372

2009 compared with 2008

Total net revenue was $100.4 billion, up by $33.2 billion, or 49%, from the prior year. The increase was driven by higher principal transactions revenue, primarily related to improved performance across most fixed income and equity products, and the absence of net markdowns on legacy leveraged lending and mortgage positions in IB, as well as higher levels of trading gains and investment securities income in Corporate/Private Equity. Results also benefited from the impact of the Washington Mutual transaction, which contributed to increases in net interest income, lending- and deposit-related fees, and mortgage fees and related income. Lastly, higher investment banking fees also contributed to revenue growth. These increases in revenue were offset partially by reduced fees and commissions from the effect of lower market levels on assets under management and custody, and the absence of proceeds from the sale of Visa shares in its initial public offering in the first quarter of 2008.

Investment banking fees increased from the prior year, due to higher equity and debt underwriting fees. For a further discussion of investment banking fees, which are primarily recorded in IB, see IB segment results on pages 63–65 of this Annual Report.

Principal transactions revenue, which consists of revenue from trading and private equity investing activities, was significantly higher compared with the prior year. Trading revenue increased, driven by improved performance across most fixed income and equity products; modest net gains on legacy leveraged lending and mortgage-related positions, compared with net markdowns of $10.6 billion in the prior year; and gains on trading positions in Corporate/Private Equity, compared with losses in the prior year of $1.1 billion on markdowns of Federal National Mortgage Association ("Fannie Mae") and Federal Home Loan Mortgage Corporation ("Freddie Mac") preferred securities. These increases in revenue were offset partially by an aggregate loss of $2.3 billion from the tightening of the Firm's credit spread on certain structured liabilities and derivatives, compared with gains of $2.0 billion in the prior year from widening spreads on these liabilities and derivatives. The Firm's private equity investments produced a slight net loss in 2009, a significant improvement from a larger net loss in 2008. For a further discussion of principal transactions revenue, see IB and Corporate/Private Equity segment results on pages 63–65 and 82–83, respectively, and Note 3 on pages 156–173 of this Annual Report.

Lending- and deposit-related fees rose from the prior year, predominantly reflecting the impact of the Washington Mutual transaction and organic growth in both lending- and deposit-related fees in RFS, CB, IB and TSS. For a further discussion of lending- and deposit-related fees, which are mostly recorded in RFS, TSS and CB, see the RFS segment results on pages 66–71, the TSS segment results on pages 77–78, and the CB segment results on pages 75–76 of this Annual Report.

The decline in asset management, administration and commissions revenue compared with the prior year was largely due to lower asset management fees in AM from the effect of lower market levels. Also contributing to the decrease were lower administration fees in TSS, driven by the effect of market depreciation on certain custody assets and lower securities lending balances; and lower brokerage commissions revenue in IB, predominantly related to lower transaction volume. For additional information on these fees and commissions, see the segment discussions for TSS on pages 77–78, and AM on pages 79–81 of this Annual Report.

Securities gains were lower in 2009 and included credit losses related to other-than-temporary impairment and lower gains on the sale of MasterCard shares of $241 million in 2009, compared with $668 million in 2008. These decreases were offset partially by higher gains from repositioning the Corporate investment securities portfolio in connection with managing the Firm's structural interest rate risk. For a further discussion of securities gains, which are mostly recorded in Corporate/Private Equity, see the Corporate/Private Equity segment discussion on pages 82–83 of this Annual Report.

Mortgage fees and related income increased slightly from the prior year, as higher net mortgage servicing revenue was largely offset by lower production revenue. The increase in net mortgage servicing revenue was driven by growth in average third-party loans serviced as a result of the Washington Mutual transaction. Mortgage production revenue declined from the prior year, reflecting an increase in estimated losses from the repurchase of previously-sold loans, offset partially by wider margins on new originations. For a discussion of mortgage fees and related income, which is recorded primarily in RFS's Consumer Lending business, see the Consumer Lending discussion on pages 68–71 of this Annual Report.

Credit card income, which includes the impact of the Washington Mutual transaction, decreased slightly compared with the prior year,

due to lower servicing fees earned in connection with CS securitization activities, largely as a result of higher credit losses. The decrease was partially offset by wider loan margins on securitized credit card loans; higher merchant servicing revenue related to the dissolution of the Chase Paymentech Solutions joint venture; and higher interchange income. For a further discussion of credit card income, see the CS segment results on pages 72–74 of this Annual Report.

Other income decreased from the prior year, due predominantly to the absence of $1.5 billion in proceeds from the sale of Visa shares during its initial public offering in the first quarter of 2008, and a $1.0 billion gain on the dissolution of the Chase Paymentech Solutions joint venture in the fourth quarter of 2008; and lower net securitization income in CS. These items were partially offset by a $464 million charge recognized in 2008 related to the repurchase of auction-rate securities at par; the absence of a $423 million loss incurred in the second quarter of 2008, reflecting the Firm's 49.4% share of Bear Stearns' losses from April 8 to May 30, 2008; and higher valuations on certain investments, including seed capital in AM.

Net interest income increased from the prior year, driven by the Washington Mutual transaction, which contributed to higher average loans and deposits. The Firm's interest-earning assets were $1.7 trillion, and the net yield on those assets, on a fully taxable-equivalent ("FTE") basis, was 3.12%, an increase of 25 basis points from 2008. Excluding the impact of the Washington Mutual transaction, the increase in net interest income in 2009 was driven by a higher level of investment securities, as well as a wider net interest margin, which reflected the overall decline in market interest rates during the year. Declining interest rates had a positive effect on the net interest margin, as rates paid on the Firm's interest-bearing liabilities decreased faster relative to the decline in rates earned on interest-earning assets. These increases in net interest income were offset partially by lower loan balances, which included the effect of lower customer demand, repayments and charge-offs.

2008 compared with 2007

Total net revenue of $67.3 billion was down $4.1 billion, or 6%, from the prior year. The decline resulted from the extremely challenging business environment for financial services firms in 2008. Principal transactions revenue decreased significantly and included net markdowns on mortgage-related positions and leveraged lending funded and unfunded commitments, losses on preferred securities of Fannie Mae and Freddie Mac, and losses on private equity investments. Also contributing to the decline in total net revenue were losses and markdowns recorded in other income, including the Firm's share of Bear Stearns' losses from April 8 to May 30, 2008. These declines were largely offset by higher net interest income, proceeds from the sale of Visa shares in its initial public offering, and the gain on the dissolution of the Chase Paymentech joint venture.

Investment banking fees were down from the record level of the prior year due to lower debt underwriting fees, as well as lower advisory and equity underwriting fees, both of which were at record levels in 2007. These declines were attributable to reduced market activity. For a further discussion of investment banking fees, which are primarily recorded in IB, see IB segment results on pages 63–65 of this Annual Report.

In 2008, principal transactions revenue declined by $19.7 billion from the prior year. Trading revenue decreased by $14.5 billion to a negative $9.8 billion, compared with positive $4.7 billion in 2007. The decline in trading revenue was largely driven by net markdowns of $5.9 billion on mortgage-related exposures, compared with $1.4 billion in net markdowns in the prior year; net markdowns of $4.7 billion on leveraged lending funded and unfunded commitments, compared with $1.3 billion in net markdowns in the prior year; losses of $1.1 billion on preferred securities of Fannie Mae and Freddie Mac; and weaker equity trading results, compared with a record level in 2007. In addition, trading revenue was adversely affected by additional losses and costs to reduce risk related to Bear Stearns positions. Partially offsetting the decline in trading revenue were record results in rates and currencies, credit trading, commodities and emerging markets, as well as strong Equity Markets client revenue; and total gains of $2.0 billion from the widening of the Firm's credit spread on certain structured liabilities and derivatives, compared with $1.3 billion in 2007. Private equity results also declined substantially from the prior year, recording losses of $908 million in 2008, compared with gains of $4.3 billion in 2007. In addition, the first quarter of 2007 included a fair value adjustment related to the adoption of new FASB guidance on fair value measurement. For a further discussion of principal transactions revenue, see IB and Corporate/Private Equity segment results on pages 63–65 and 82–83, respectively, and Note 3 on pages 156–173 of this Annual Report.

Lending- and deposit-related fees rose from 2007, predominantly resulting from higher deposit-related fees and the impact of the Washington Mutual transaction. For a further discussion of Lending- and deposit-related fees, which are mostly recorded in RFS, TSS and CB, see the RFS segment results on pages 66–71, the TSS segment results on pages 77–78 and the CB segment results on pages 75–76 of this Annual Report.

The decline in asset management, administration and commissions revenue compared with 2007 was driven by lower asset management fees in AM, due to lower performance fees and the effect of lower market levels. This decline was partially offset by an increase in commissions revenue, related predominantly to higher brokerage transaction volume within IB's Equity Markets revenue, which included additions from Bear Stearns' Prime Services business; and higher administration fees in TSS, driven by wider spreads in securities lending and increased product usage by new and existing clients. For additional information on these fees and commissions, see the segment discussions for IB on pages 63–65, RFS on pages 66–71, TSS on pages 77–78 and AM on pages 79–81 of this Annual Report.

The increase in securities gains compared with the prior year was due to the repositioning of the Corporate investment securities portfolio, as part of managing the structural interest rate risk of the

Firm; and higher gains from the sale of MasterCard shares. For a further discussion of securities gains, which are mostly recorded in the Firm's Corporate/Private Equity business, see the Corporate/Private Equity segment discussion on pages 82–83 of this Annual Report.

Mortgage fees and related income increased from the prior year, driven by higher net mortgage servicing revenue, which benefited from an improvement in mortgage servicing rights ("MSR") risk management results and increased loan servicing revenue. Mortgage production revenue increased slightly, as growth in originations was predominantly offset by markdowns on the mortgage warehouse and increased losses related to the repurchase of previously sold loans. For a discussion of mortgage fees and related income, which is recorded primarily in RFS's Consumer Lending business, see the Consumer Lending discussion on pages 68–71 of this Annual Report.

Credit card income rose compared with the prior year, driven by increased interchange income, due to higher customer charge volume in CS and higher debit card transaction volume in RFS; the impact of the Washington Mutual transaction; and increased servicing fees resulting from a higher level of securitized receivables. These results were partially offset by increases in volume-driven payments to partners and expense related to rewards programs. For a further discussion of credit card income, see CS's segment results on pages 72–74 of this Annual Report.

Other income increased compared with the prior year, due predominantly to the proceeds from the sale of Visa shares in its initial public offering of $1.5 billion, the gain on the dissolution of the Chase Paymentech joint venture of $1.0 billion, and gains on sales of certain other assets. These proceeds and gains were partially offset by lower valuations on certain investments, including seed capital in AM; a $464 million charge related to the offer to repurchase auction-rate securities at par; losses of $423 million reflecting the Firm's 49.4% ownership in Bear Stearns' losses from April 8 to May 30, 2008; and lower net securitization income in CS.

Net interest income increased from the prior year driven, in part, by the Washington Mutual transaction, which contributed to higher average loans and deposits, and, to a lesser extent, by the Bear Stearns merger. The Bear Stearns Prime Services business contributed to higher net interest income, as this business increased average balances in other interest-earning assets (primarily customer receivables) and other interest-bearing liabilities (primarily customer payables). The Firm's interest-earning assets were $1.4 trillion, and the net yield on those assets, on an FTE basis, was 2.87%, an increase of 48 basis points from 2007. Excluding the impact of the Washington Mutual transaction and the Bear Stearns merger, the increase in net interest income in 2008 was driven by a wider net interest margin, which reflected the overall decline in market interest rates during the year. The decline in rates had a positive effect on the net interest margin, as rates paid on the Firm's interest-bearing liabilities decreased faster relative to the decrease in rates earned on interest-earning assets. Growth in consumer and wholesale loan balances also contributed to the increase in net interest income.

Provision for credit losses

Year ended December 31, (in millions)	2009	2008	2007
Wholesale	**$ 3,974**	$ 3,327	$ 934
Consumer	**28,041**	17,652	5,930
Total provision for credit losses	**$ 32,015**	$ 20,979	$ 6,864

2009 compared with 2008

The provision for credit losses in 2009 rose by $11.0 billion compared with the prior year, predominantly due to a significant increase in the consumer provision. The prior year included a $1.5 billion charge to conform Washington Mutual's allowance for loan losses, which affected both the consumer and wholesale portfolios. For the purpose of the following analysis, this charge is excluded. The consumer provision reflected additions to the allowance for loan losses for the home equity, mortgage and credit card portfolios, as weak economic conditions, housing price declines and higher unemployment rates continued to drive higher estimated losses for these portfolios. Included in the 2009 addition to the allowance for loan losses was a $1.6 billion provision related to estimated deterioration in the Washington Mutual purchased credit-impaired portfolio. The wholesale provision increased from the prior year, reflecting continued weakness in the credit environment in 2009 compared with the prior year. For a more detailed discussion of the loan portfolio and the allowance for loan losses, see the segment discussions for RFS on pages 66–71, CS on pages 72–74, IB on pages 63–65 and CB on pages 75–76, and the Allowance for Credit Losses section on pages 123–125 of this Annual Report.

2008 compared with 2007

The provision for credit losses in 2008 rose by $14.1 billion compared with the prior year, due to increases in both the consumer and wholesale provisions. The increase in the consumer provision reflected higher estimated losses for home equity and mortgages resulting from declining housing prices; an increase in estimated losses for the auto, student and business banking loan portfolios; and an increase in the allowance for loan losses and higher charge-offs of credit card loans. The increase in the wholesale provision was driven by a higher allowance resulting from a weakening credit environment and growth in retained loans. The wholesale provision in the first quarter of 2008 also included the effect of the transfer of $4.9 billion of funded and unfunded leveraged lending commitments to retained loans from the held-for-sale portfolio. In addition, in 2008 both the consumer and wholesale provisions were affected by a $1.5 billion charge to conform assets acquired from Washington Mutual to the Firm's loan loss methodologies. For a more detailed discussion of the loan portfolio and the allowance for loan losses, see the segment discussions for RFS on pages 66–71, CS on pages 72–74, IB on pages 63–65 and CB on pages 75–76, and the Credit Risk Management section on pages 101–125 of this Annual Report.

Noninterest expense

The following table presents the components of noninterest expense.

Year ended December 31, (in millions)	2009	2008	2007
Compensation expense	**$ 26,928**	$ 22,746	$ 22,689
Noncompensation expense:			
Occupancy expense	**3,666**	3,038	2,608
Technology, communications and equipment expense	**4,624**	4,315	3,779
Professional & outside services	**6,232**	6,053	5,140
Marketing	**1,777**	1,913	2,070
Other expense[a][b]	**7,594**	3,740	3,814
Amortization of intangibles	**1,050**	1,263	1,394
Total noncompensation expense	**24,943**	20,322	18,805
Merger costs	**481**	432	209
Total noninterest expense	**$ 52,352**	$ 43,500	$ 41,703

(a) Includes a $675 million FDIC special assessment in 2009.
(b) Includes foreclosed property expense of $1.4 billion, $213 million and $56 million for 2009, 2008 and 2007, respectively. For additional information regarding foreclosed property, see Note 13 on pages 200–204 of this Annual Report.

2009 compared with 2008

Total noninterest expense was $52.4 billion, up $8.9 billion, or 20%, from the prior year. The increase was driven by the impact of the Washington Mutual transaction, higher performance-based compensation expense, higher FDIC-related costs and increased mortgage servicing and default-related expense. These items were offset partially by lower headcount-related expense, including salary and benefits but excluding performance-based incentives, and other noncompensation costs related to employees.

Compensation expense increased in 2009 compared with the prior year, reflecting higher performance-based incentives, as well as the impact of the Washington Mutual transaction. Excluding these two items, compensation expense decreased as a result of a reduction in headcount, particularly in the wholesale businesses and in Corporate.

Noncompensation expense increased from the prior year, due predominantly to the following: the impact of the Washington Mutual transaction; higher ongoing FDIC insurance premiums and an FDIC special assessment of $675 million recognized in the second quarter of 2009; higher mortgage servicing and default-related expense, which included an increase in foreclosed property expense of $1.2 billion; higher litigation costs; and the effect of the dissolution of the Chase Paymentech Solutions joint venture. The increase was partially offset by lower headcount-related expense, particularly in IB, TSS and AM; a decrease in amortization of intangibles, predominantly related to purchased credit card relationships; lower mortgage reinsurance losses; and a decrease in credit card marketing expense. For a discussion of amortization of intangibles, refer to Note 17 on pages 222–225 of this Annual Report.

For information on merger costs, refer to Note 10 on page 194 of this Annual Report.

2008 compared with 2007

Total noninterest expense for 2008 was $43.5 billion, up $1.8 billion, or 4%, from the prior year. The increase was driven by the additional operating costs related to the Washington Mutual transaction and Bear Stearns merger and investments in the businesses, partially offset by lower performance-based incentives.

Compensation expense increased slightly from the prior year, predominantly driven by investments in the businesses, including headcount additions associated with the Bear Stearns merger and Washington Mutual transaction, largely offset by lower performance-based incentives.

Noncompensation expense increased from the prior year as a result of the Bear Stearns merger and Washington Mutual transaction. Excluding the effect of these transactions, noncompensation expense decreased due to a net reduction in other expense related to litigation; lower credit card and consumer lending marketing expense; and a decrease in the amortization of intangibles, as certain purchased credit card relationships were fully amortized in 2007, and the amortization rate for core deposit intangibles declined in accordance with the amortization schedule. These decreases were offset partially by increases in professional & outside services, driven by investments in new product platforms in TSS, and business and volume growth in CS credit card processing and IB brokerage, clearing and exchange transaction processing. Also contributing to the increases were the following: an increase in other expense due to higher mortgage reinsurance losses and mortgage servicing expense due to increased delinquencies and defaults in RFS; an increase in technology, communications and equipment expense, reflecting higher depreciation expense on owned automobiles subject to operating leases in RFS, and other technology-related investments across the businesses; and an increase in occupancy expense, partly related to the expansion of RFS's retail distribution network. For a further discussion of amortization of intangibles, refer to Note 17 on pages 222–225 of this Annual Report.

For information on merger costs, refer to Note 10 on page 194 of this Annual Report.

Income tax expense

The following table presents the Firm's income before income tax expense/(benefit) and extraordinary gain, income tax expense/(benefit) and effective tax rate.

Year ended December 31, (in millions, except rate)	**2009**	2008	2007
Income before income tax expense/ (benefit) and extraordinary gain	**$ 16,067**	$ 2,773	$ 22,805
Income tax expense/(benefit)	**4,415**	(926)	7,440
Effective tax rate	**27.5%**	(33.4)%	32.6%

2009 compared with 2008

The change in the effective tax rate compared with the prior year was primarily the result of higher reported pretax income and changes in the proportion of income subject to U.S. federal and state and local taxes. Benefits related to tax-exempt income, business tax credits and tax audit settlements increased in 2009 relative to 2008; however, the impact of these items on the effective tax rate was reduced by the significantly higher level of pretax income in 2009. In addition, 2008 reflected the realization of benefits of $1.1 billion from the release of deferred tax liabilities associated with the undistributed earnings of certain non-U.S. subsidiaries that were deemed to be reinvested indefinitely. For a further discussion of income taxes, see Critical Accounting Estimates Used by the Firm on pages 135–139 and Note 27 on pages 234–236 of this Annual Report.

2008 compared with 2007

The decrease in the effective tax rate in 2008 compared with the prior year was the result of significantly lower reported pretax income, combined with changes in the proportion of income subject to U.S. federal taxes. Also contributing to the decrease in the effective tax rate was increased business tax credits and the realization of a $1.1 billion benefit from the release of deferred tax liabilities. These deferred tax liabilities were associated with the undistributed earnings of certain non-U.S. subsidiaries that were deemed to be reinvested indefinitely. These decreases were partially offset by changes in state and local taxes, and equity losses representing the Firm's 49.4% ownership interest in Bear Stearns' losses from April 8 to May 30, 2008, for which no income tax benefit was recorded.

Extraordinary gain

On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual. This transaction was accounted for under the purchase method of accounting for business combinations. The adjusted net asset value of the banking operations after purchase accounting adjustments was higher than the consideration paid by JPMorgan Chase, resulting in an extraordinary gain. The preliminary gain recognized in 2008 was $1.9 billion. In the third quarter of 2009, the Firm recognized a $76 million increase in the extraordinary gain associated with the final purchase accounting adjustments for the acquisition. For a further discussion of the Washington Mutual transaction, see Note 2 on pages 151–156 of this Annual Report.

EXPLANATION AND RECONCILIATION OF THE FIRM'S USE OF NON-GAAP FINANCIAL MEASURES

The Firm prepares its consolidated financial statements using accounting principles generally accepted in the United States of America ("U.S. GAAP"); these financial statements appear on pages 146–149 of this Annual Report. That presentation, which is referred to as "reported basis," provides the reader with an understanding of the Firm's results that can be tracked consistently from year to year and enables a comparison of the Firm's performance with other companies' U.S. GAAP financial statements.

In addition to analyzing the Firm's results on a reported basis, management reviews the Firm's results and the results of the lines of business on a "managed" basis, which is a non-GAAP financial measure. The Firm's definition of managed basis starts with the reported U.S. GAAP results and includes certain reclassifications that assume credit card loans securitized by CS remain on the balance sheets, and presents revenue on a FTE basis. These adjustments do not have any impact on net income as reported by the lines of business or by the Firm as a whole.

The presentation of CS results on a managed basis assumes that credit card loans that have been securitized and sold in accordance with U.S. GAAP remain on the Consolidated Balance Sheets, and that the earnings on the securitized loans are classified in the same manner as the earnings on retained loans recorded on the Consolidated Balance Sheets. JPMorgan Chase uses the concept of managed basis to evaluate the credit performance and overall financial performance of the entire managed credit card portfolio. Operations are funded and decisions are made about allocating resources, such as employees and capital, based on managed financial information. In addition, the same underwriting standards and ongoing risk monitoring are used for both loans on the Consolidated Balance Sheets and securitized loans. Although securitizations result in the sale of credit card receivables to a trust, JPMorgan Chase retains the ongoing customer relationships, as the customers may continue to use their credit cards; accordingly, the customer's credit performance will affect both the securitized loans and the loans retained on the Consolidated Balance Sheets. JPMorgan Chase believes managed basis information is useful to investors, enabling them to understand both the credit risks associated with the loans reported on the Consolidated Balance Sheets and the Firm's retained interests in securitized loans. For a reconciliation of reported to managed basis results for CS, see CS segment results on pages 72–74 of this Annual Report. For information regarding the securitization process, and loans and residual interests sold and securitized, see Note 15 on pages 206–213 of this Annual Report.

The following summary table provides a reconciliation from the Firm's reported U.S. GAAP results to managed basis.

(Table continues on next page)

Year ended December 31, (in millions, except per share and ratio data)	2009 Reported results	2009 Credit card (d)	2009 Fully tax-equivalent adjustments	2009 Managed basis	2008 Reported results	2008 Credit card (d)	2008 Fully tax-equivalent adjustments	2008 Managed basis

Total assets – average	**2,024,201**	**82,233**	**—**	**2,106,434**	1,791,617	76,904	—	1,868,521

(a) 2008 included an accounting conformity loan loss reserve provision related to the acquisition of Washington Mutual's banking operations.
(b) Effective January 1, 2009, the Firm implemented new FASB guidance for participating securities. Accordingly, prior-period amounts have been revised. For further discussion of the guidance, see Note 25 on page 232 of this Annual Report.
(c) Based on income before extraordinary gain.
(d) See pages 72–74 of this Annual Report for a discussion of the effect of credit card securitizations on CS.

On January 1, 2010, the Firm adopted the new consolidation accounting guidance for VIE's. As the Firm will be deemed to be the primary beneficiary of its credit card securitization trusts as a result of this guidance, the Firm will consolidate the assets and liabilities of these credit card securitization trusts at their carrying values on January 1, 2010, and credit card–related income and credit costs associated with these securitization activities will be prospectively recorded on the 2010 Consolidated Statements of Income in the same classifications that are currently used to report such items on a managed basis. For additional information on the new accounting guidance, see "Accounting and reporting developments" on pages 140–142 of this Annual Report.

Total net revenue for each of the business segments and the Firm is presented on a FTE basis. Accordingly, investments that receive tax credits and revenue from tax-exempt securities are presented in the managed results on a basis comparable to taxable investments and securities. This non-GAAP financial measure allows management to assess the comparability of revenue arising from both taxable and tax-exempt sources.

The corresponding income tax impact related to these items is recorded within income tax expense.

Tangible common equity ("TCE") represents common stockholders' equity (i.e., total stockholders' equity less preferred stock) less identifiable intangible assets (other than MSRs) and goodwill, net of related deferred tax liabilities. ROTCE, a non-GAAP financial ratio, measures the Firm's earnings as a percentage of TCE and is, in management's view, another meaningful measure to assess the Firm's use of equity.

Management also uses certain non-GAAP financial measures at the business-segment level, because it believes these other non-GAAP financial measures provide information to investors about the underlying operational performance and trends of the particular business segment and therefore facilitate a comparison of the business segment with the performance of its competitors.

Calculation of certain U.S. GAAP and non-GAAP metrics

The table below reflects the formulas used to calculate both the following U.S. GAAP and non-GAAP measures.

Return on common equity
Net income* / Average common stockholders' equity

Return on tangible common equity[e]
Net income* / Average tangible common equity

Return on assets
Reported net income / Total average assets
Managed net income / Total average managed assets[f] (including average securitized credit card receivables)

Overhead ratio
Total noninterest expense / Total net revenue

* Represents net income applicable to common equity

(e) The Firm uses ROTCE, a non-GAAP financial measure, to evaluate the Firm's use of equity and to facilitate comparisons with competitors. Refer to the following page for the calculation of average tangible common equity.

(f) The Firm uses return on managed assets, a non-GAAP financial measure, to evaluate the overall performance of the managed credit card portfolio, including securitized credit card loans.

Average tangible common equity

Year ended December 31, (in millions)	2009	2008
Common stockholders' equity	**$ 145,903**	$129,116
Less: Goodwill	**48,254**	46,068
Less: Certain identifiable intangible assets	**5,095**	5,779
Add: Deferred tax liabilities[(a)]	**2,547**	2,369
TCE	**$ 95,101**	$ 79,638

(a) Represents deferred tax liabilities related to tax-deductible goodwill and to identifiable intangibles created in non-taxable transactions, which are netted against goodwill and other intangibles when calculating TCE.

Impact on ROE of redemption of TARP preferred stock issued to the U.S. Treasury

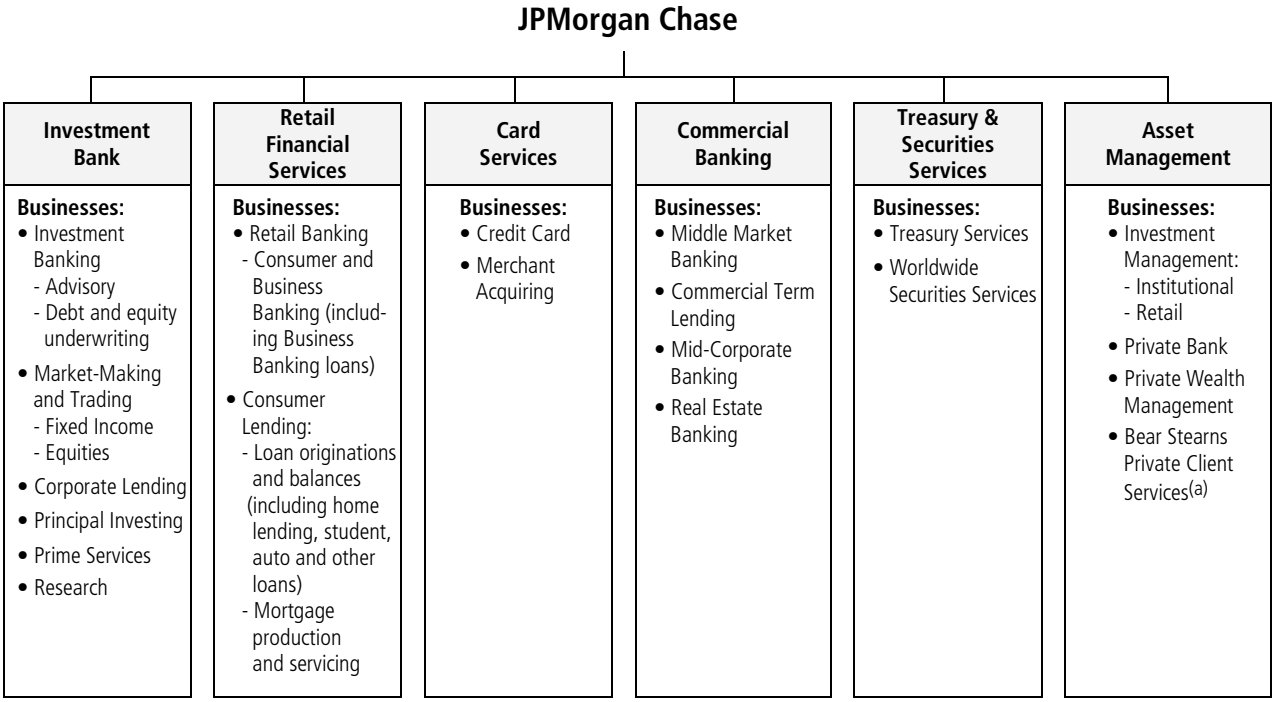
The calculation of 2009 net income applicable to common equity includes a one-time, noncash reduction of $1.1 billion resulting from the repayment of TARP preferred capital. Excluding this reduction, ROE would have been 7% for 2009. The Firm views adjusted ROE, a non-GAAP financial measure, as meaningful because it enables the comparability to prior periods.

Year ended December 31, 2009 (in millions, except ratios)	As reported	Excluding the TARP redemption
Return on equity		
Net income	$ 11,728	$ 11,728
Less: Preferred stock dividends	1,327	1,327
Less: Accelerated amortization from redemption of preferred stock issued to the U.S. Treasury	1,112	—
Net income applicable to common equity	$ 9,289	$ 10,401
Average common stockholders' equity	$ 145,903	$ 145,903
ROE	6%	7%

Impact on diluted earnings per share of redemption of TARP preferred stock issued to the U.S. Treasury

Net income applicable to common equity for the year ended December 31, 2009, included a one-time, noncash reduction of approximately $1.1 billion resulting from the repayment of TARP preferred capital. The following table presents the effect on net income applicable to common stockholders and the $0.27 reduction to diluted earnings per share for the year ended December 31, 2009.

Year ended December 31, 2009 (in millions, except per share)	As reported	Effect of TARP redemption
Diluted earnings per share		
Net income	$ 11,728	$ —
Less: Preferred stock dividends	1,327	—
Less: Accelerated amortization from redemption of preferred stock issued to the U.S. Treasury	1,112	1,112
Net income applicable to common equity	$ 9,289	$ (1,112)
Less: Dividends and undistributed earnings allocated to participating securities	515	(62)
Net income applicable to common stockholders	$ 8,774	$ (1,050)
Total weighted average diluted shares outstanding	3,879.7	3,879.7
Net income per share	$ 2.26	$ (0.27)



Other financial measures

The Firm also discloses the allowance for loan losses to total retained loans, excluding home lending purchased credit-impaired loans and loans held by the Washington Mutual Master Trust. For a further discussion of this credit metric, see Allowance for Credit Losses on pages 123–125 of this Annual Report.

BUSINESS SEGMENT RESULTS

The Firm is managed on a line-of-business basis. The business segment financial results presented reflect the current organization of JPMorgan Chase. There are six major reportable business segments: the Investment Bank, Retail Financial Services, Card Services, Commercial Banking, Treasury & Securities Services and Asset Management, as well as a Corporate/Private Equity segment.

The business segments are determined based on the products and services provided, or the type of customer served, and they reflect the manner in which financial information is currently evaluated by management. Results of these lines of business are presented on a managed basis.

(a) Bear Stearns Private Client Services was renamed to JPMorgan Securities at the beginning of 2010.

Description of business segment reporting methodology

Results of the business segments are intended to reflect each segment as if it were essentially a stand-alone business. The management reporting process that derives business segment results allocates income and expense using market-based methodologies. Business segment reporting methodologies used by the Firm are discussed below. The Firm continues to assess the assumptions, methodologies and reporting classifications used for segment reporting, and further refinements may be implemented in future periods.

Revenue sharing

When business segments join efforts to sell products and services to the Firm's clients, the participating business segments agree to share revenue from those transactions. The segment results reflect these revenue-sharing agreements.

Funds transfer pricing

Funds transfer pricing is used to allocate interest income and expense to each business and transfer the primary interest rate risk exposures to the Treasury group within the Corporate/Private Equity business segment. The allocation process is unique to each business segment and considers the interest rate risk, liquidity risk and regulatory requirements of that segment's stand-alone peers. This process is overseen by senior management and reviewed by the Firm's Asset-Liability Committee ("ALCO"). Business segments may retain certain interest rate exposures, subject to management approval, that would be expected in the normal operation of a similar peer business.

Capital allocation

Each business segment is allocated capital by taking into consideration stand-alone peer comparisons, economic risk measures and regulatory capital requirements. The amount of capital assigned to each business is referred to as equity. For a further discussion, see Capital management–Line of business equity on pages 92–93 of this Annual Report.

Expense allocation

Where business segments use services provided by support units within the Firm, the costs of those support units are allocated to the business segments. The expense is allocated based on their

actual cost or the lower of actual cost or market, as well as upon usage of the services provided. In contrast, certain other expense related to certain corporate functions, or to certain technology and operations, are not allocated to the business segments and are retained in Corporate. Retained expense includes: parent company costs that would not be incurred if the segments were stand-alone businesses; adjustments to align certain corporate staff, technology and operations allocations with market prices; and other one-time items not aligned with the business segments.

Segment results – Managed basis[a]

The following table summarizes the business segment results for the periods indicated.

Year ended December 31,	Total net revenue			Noninterest expense		
(in millions)	**2009**	2008	2007	**2009**	2008	2007

(a) Represents reported results on a tax-equivalent basis and excludes the impact of credit card securitizations.

(b) In the second quarter of 2009, IB began reporting its credit reimbursement from TSS as a component of its total net revenue, whereas TSS continues to report its credit reimbursement to IB as a separate line item on its income statement (not part of total net revenue). Corporate/Private Equity includes an adjustment to offset IB's inclusion of the credit reimbursement in total net revenue. Prior periods have been revised for IB and Corporate/Private Equity to reflect this presentation.

(c) Net income included an extraordinary gain of $76 million and $1.9 billion related to the Washington Mutual transaction for 2009 and 2008, respectively.

J.P. Morgan is one of the world's leading investment banks, with deep client relationships and broad product capabilities. The Investment Bank's clients are corporations, financial institutions, governments and institutional investors. The Firm offers a full range of investment banking products and services in all major capital markets, including advising on corporate strategy and structure, capital raising in equity and debt markets, sophisticated risk management, market-making in cash securities and derivative instruments, prime brokerage, research and thought leadership. IB also commits the Firm's own capital to principal investing and trading activities on a limited basis.

Selected income statement data

(a) The 2009 results reflect modest net gains on legacy leveraged lending and mortgage-related positions, compared with net markdowns of $10.6 billion and $2.7 billion in 2008 and 2007, respectively.

(b) TSS was charged a credit reimbursement related to certain exposures managed within IB credit portfolio on behalf of clients shared with TSS. IB recognizes this credit reimbursement in its credit portfolio business in all other income. Prior periods have been revised to conform to the current presentation.

(c) Total net revenue included tax-equivalent adjustments, predominantly due to income tax credits related to affordable housing and alternative energy investments as well as tax-exempt income from municipal bond investments of $1.4 billion, $1.7 billion and $927 million for 2009, 2008 and 2007, respectively.

(d) The income tax benefit in 2008 includes the result of reduced deferred tax liabilities on overseas earnings.

(e) Results for 2008 include seven months of the combined Firm's (JPMorgan Chase & Co.'s and Bear Stearns') results and five months of heritage JPMorgan Chase results. 2007 reflects heritage JPMorgan Chase & Co. results only.

The following table provides IB's total net revenue by business segment.

Year ended December 31, (in millions)	2009	2008[d]	2007
Revenue by business			
Investment banking fees:			
Advisory	**$ 1,867**	$ 2,008	$ 2,273
Equity underwriting	**2,641**	1,749	1,713
Debt underwriting	**2,661**	2,150	2,630
Total investment banking fees	**7,169**	5,907	6,616
Fixed income markets[a]	**17,564**	1,957	6,339
Equity markets[b]	**4,393**	3,611	3,903
Credit portfolio[c]	**(1,017)**	860	1,433
Total net revenue	**$ 28,109**	$12,335	$18,291
Revenue by region			
Americas	**$ 15,156**	$ 2,610	$ 8,245
Europe/Middle East/Africa	**9,790**	7,710	7,330
Asia/Pacific	**3,163**	2,015	2,716
Total net revenue	**$ 28,109**	$12,335	$18,291

(a) Fixed income markets primarily include client and portfolio management revenue related to market-making across global fixed income markets, including foreign exchange, interest rate, credit and commodities markets.

(b) Equities markets primarily include client and portfolio management revenue related to market-making across global equity products, including cash instruments, derivatives and convertibles.

(c) Credit portfolio revenue includes net interest income, fees and the impact of loan sales activity, as well as gains or losses on securities received as part of a loan restructuring, for IB's credit portfolio. Credit portfolio revenue also includes the results of risk management related to the Firm's lending and derivative activities, and changes in the credit valuation adjustment, which is the component of the fair value of a derivative that reflects the credit quality of the counterparty. Additionally, credit portfolio revenue incorporates an adjustment to the valuation of the Firm's derivative liabilities. See pages 101–125 of the Credit Risk Management section of this Annual Report for further discussion.

(d) Results for 2008 include seven months of the combined Firm's (JPMorgan Chase & Co.'s and Bear Stearns') results and five months of heritage JPMorgan Chase & Co. results. 2007 reflects heritage JPMorgan Chase & Co.'s results only.

2009 compared with 2008

Net income was $6.9 billion, compared with a net loss of $1.2 billion in the prior year. These results reflected significantly higher total net revenue, partially offset by higher noninterest expense and a higher provision for credit losses.

Total net revenue was $28.1 billion, compared with $12.3 billion in the prior year. Investment banking fees were up 21% to $7.2 billion, consisting of debt underwriting fees of $2.7 billion (up 24%), equity underwriting fees of $2.6 billion (up 51%), and advisory fees of $1.9 billion (down 7%). Fixed Income Markets revenue was $17.6 billion, compared with $2.0 billion in the prior year, reflecting improved performance across most products and modest net gains on legacy leveraged lending and mortgage-related positions, compared with net markdowns of $10.6 billion in the prior year. These results also included losses of $1.0 billion from the tightening of the Firm's credit spread on certain structured liabilities, compared with gains of $814 million in the prior year. Equity Markets revenue was $4.4 billion, up 22% from the prior year, driven by strong client revenue across products, particularly prime services, and improved trading results. These results also included losses of $536 million from the tightening of the Firm's credit spread on certain structured liabilities, compared with gains

of $510 million in the prior year. Credit Portfolio revenue was a loss of $1.0 billion versus a gain of $860 million in the prior year, driven by mark-to-market losses on hedges of retained loans compared with gains in the prior year, partially offset by the positive net impact of credit spreads on derivative assets and liabilities.

The provision for credit losses was $2.3 billion, compared with $2.0 billion in the prior year, reflecting continued weakness in the credit environment. The allowance for loan losses to end-of-period loans retained was 8.25%, compared with 4.83% in the prior year. Net charge-offs were $1.9 billion, compared with $105 million in the prior year. Total nonperforming assets were $4.2 billion, compared with $2.5 billion in the prior year.

Noninterest expense was $15.4 billion, up $1.6 billion, or 11%, from the prior year, driven by higher performance-based compensation expense, partially offset by lower headcount-related expense.

Return on Equity was 21% on $33.0 billion of average allocated capital, compared with negative 5% on $26.1 billion of average allocated capital in the prior year.

2008 compared with 2007

Net loss was $1.2 billion, a decrease of $4.3 billion from the prior year, driven by lower total net revenue, a higher provision for credit losses and higher noninterest expense, partially offset by a reduction in deferred tax liabilities on overseas earnings.

Total net revenue was $12.3 billion, down $6.0 billion, or 33%, from the prior year. Investment banking fees were $5.9 billion, down 11% from the prior year, driven by lower debt underwriting and advisory fees reflecting reduced market activity. Debt underwriting fees were $2.2 billion, down 18% from the prior year, driven by lower loan syndication and bond underwriting fees. Advisory fees of $2.0 billion declined 12% from the prior year. Equity underwriting fees were $1.7 billion, up 2% from the prior year driven by improved market share. Fixed Income Markets revenue was $2.0 billion, compared with $6.3 billion in the prior year. The decrease was driven by $5.9 billion of net markdowns on mortgage-related exposures and $4.7 billion of net markdowns on leveraged lending funded and unfunded commitments. Revenue was also adversely impacted by additional losses and costs to reduce risk related to Bear Stearns' positions. These results were offset by record performance in rates and currencies, credit trading, commodities and emerging markets as well as $814 million of gains from the widening of the Firm's credit spread on certain structured liabilities and derivatives. Equity Markets revenue was $3.6 billion, down 7% from the prior year, reflecting weak trading results, partially offset by strong client revenue across products including prime services, as well as $510 million of gains from the widening of the Firm's credit spread on certain structured liabilities and derivatives. Credit portfolio revenue was $860 million, down 40%, driven by losses from widening counterparty credit spreads.

The provision for credit losses was $2.0 billion, an increase of $1.4 billion from the prior year, predominantly reflecting a higher allowance for credit losses, driven by a weakening credit environment, as well as the effect of the transfer of $4.9 billion of funded and unfunded leveraged lending commitments to retained loans from held-for-sale in the first quarter of 2008. Net charge-offs for the year were $105 million, compared with $36 million in the prior year. Total nonperforming assets were $2.5 billion, an increase of $2.0 billion compared with the prior year, reflecting a weakening credit environment. The allowance for loan losses to average loans was 4.71% for 2008, compared with a ratio of 2.14% in the prior year.

Noninterest expense was $13.8 billion, up $770 million, or 6%, from the prior year, reflecting higher noncompensation expense driven primarily by additional expense relating to the Bear Stearns merger, offset partially by lower performance-based compensation expense.

Return on equity was negative 5% on $26.1 billion of average allocated capital, compared with 15% on $21.0 billion in the prior year.

Trading assets – derivative receivables	**96,042**	112,337	63,198
Loans:			
Loans retained[a]	**62,722**	73,108	62,247
Loans held-for-sale and loans at fair value	**7,589**	18,502	17,723
Total loans	**70,311**	91,610	79,970
Adjusted assets[b]	**538,724**	679,780	611,749
Equity	**33,000**	26,098	21,000
Headcount	**24,654**	27,938	25,543

(a) Loans retained included credit portfolio loans, leveraged leases and other accrual loans, and excluded loans held-for-sale and loans at fair value.

(b) Adjusted assets, a non-GAAP financial measure, equals total assets minus (1) securities purchased under resale agreements and securities borrowed less securities sold, not yet purchased; (2) assets of variable interest entities ("VIEs"); (3) cash and securities segregated and on deposit for regulatory and other purposes; (4) goodwill and intangibles; (5) securities received as collateral; and (6) investments purchased under the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility ("AML Facility"). The amount of adjusted assets is presented to assist the reader in comparing IB's asset and capital levels to other investment banks in the securities industry. Asset-to-equity leverage ratios are commonly used as one measure to assess a company's capital adequacy. IB believes an adjusted asset amount that excludes the assets discussed above, which were considered to have a low risk profile, provides a more meaningful measure of balance sheet leverage in the securities industry.

Equities	**75**	57	48
Commodities and other	**32**	32	33
Diversification[e]	**(131)**	(108)	(77)
Total trading VaR[f]	**227**	196	107
Credit portfolio VaR[g]	**101**	69	17
Diversification[e]	**(80)**	(63)	(18)
Total trading and credit portfolio VaR	**$ 248**	$ 202	$ 106

(a) Loans retained included credit portfolio loans, leveraged leases and other accrual loans, and excluded loans held-for-sale and loans accounted for at fair value.
(b) Allowance for loan losses of $1.3 billion and $430 million were held against these nonperforming loans at December 31, 2009 and 2008, respectively.
(c) Loans held-for-sale and loans at fair value were excluded when calculating the allowance coverage ratio and net charge-off rate.
(d) Results for 2008 include seven months of the combined Firm's (JPMorgan Chase & Co.'s and Bear Stearns') results and five months of heritage JPMorgan Chase & Co.'s results only. 2007 reflects heritage JPMorgan Chase & Co. results. For a more complete description of value-at-risk ("VaR"), see pages 126–130 of this Annual Report.
(e) Average VaRs were less than the sum of the VaRs of their market risk components, due to risk offsets resulting from portfolio diversification. The diversification effect reflected the fact that the risks were not perfectly correlated. For further discussion of VaR, see pages 126–130 of this Annual Report. The risk of a portfolio of positions is usually less than the sum of the risks of the positions themselves.
(f) Trading VaR includes predominantly all trading activities in IB; however, particular risk parameters of certain products are not fully captured, for example, correlation risk. Trading VaR does not include VaR related to held-for-sale funded loans and unfunded commitments, nor the debit valuation adjustments ("DVA") taken on derivative and structured liabilities to reflect the credit quality of the Firm. See VaR discussion on pages 126–130 and the DVA Sensitivity table on page 130 of this Annual Report for further details. Trading VaR also does not include the MSR portfolio or VaR related to other corporate functions, such as Corporate/Private Equity. Beginning in the fourth quarter of 2008, trading VaR includes the estimated credit spread sensitivity of certain mortgage products.
(g) Included VaR on derivative credit valuation adjustments ("CVA"), hedges of the CVA and mark-to-market hedges of the retained loan portfolio, which were all reported in principal transactions revenue. This VaR does not include the retained loan portfolio.
(h) Excluding the impact of a loan originated in March 2008 to Bear Stearns, the adjusted ratio would be 4.84% for 2008. The average balance of the loan extended to Bear Stearns was $1.9 billion for 2008.

(b) Includes asset-backed securities, mortgage-backed securities and municipal securities.
(c) Includes rights offerings; U.S.- domiciled equity and equity-related transactions.
(d) Global announced M&A is based on rank value; all other rankings are based on proceeds, with full credit to each book manager/equal if joint. Because of joint assignments, market share of all participants will add up to more than 100%. Global and U.S. announced M&A market share and rankings for 2008 and 2007 include transactions withdrawn since December 31, 2008 and 2007. U.S. announced M&A represents any U.S. involvement ranking.

According to Thomson Reuters, in 2009, the Firm was ranked #1 in Global Debt, Equity and Equity-related; #1 in Global Equity and Equity-related; #1 in Global Long-Term Debt: #1 in Global Syndicated Loans and #3 in Global Announced M&A, based on volume.

According to Dealogic, the Firm was ranked #1 in Global Investment Banking Fees generated during 2009, based on revenue.

RETAIL FINANCIAL SERVICES

Retail Financial Services, which includes the Retail Banking and Consumer Lending businesses, serves consumers and businesses through personal service at bank branches and through ATMs, online banking and telephone banking, as well as through auto dealerships and school financial-aid offices. Customers can use more than 5,100 bank branches (third-largest nationally) and 15,400 ATMs (second-largest nationally), as well as online and mobile banking around the clock. More than 23,900 branch salespeople assist customers with checking and savings accounts, mortgages, home equity and business loans, and investments across the 23-state footprint from New York and Florida to California. Consumers also can obtain loans through more than 15,700 auto dealerships and nearly 2,100 schools and universities nationwide.

On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual from the FDIC for $1.9 billion through a purchase of substantially all of the assets and assumption of specified liabilities of Washington Mutual. Washington Mutual's banking operations consisted of a retail bank network of 2,244 branches, a nationwide credit card lending business, a multi-family and commercial real estate lending business, and nationwide mortgage banking activities. The transaction expanded the Firm's U.S. consumer branch network in California, Florida, Washington, Georgia, Idaho, Nevada and Oregon and created the nation's third-largest branch network.

Selected income statement data

Financial ratios			
ROE	**—%**	5%	18%
Overhead ratio	**51**	51	57
Overhead ratio excluding core deposit intangibles[(a)]	**50**	50	55

(a) Retail Financial Services uses the overhead ratio (excluding the amortization of core deposit intangibles ("CDI")), a non-GAAP financial measure, to evaluate the underlying expense trends of the business. Including CDI amortization expense in the overhead ratio calculation would result in a higher overhead ratio in the earlier years and a lower overhead ratio in later years; this method would therefore result in an improving overhead ratio over time, all things remaining equal. The non-GAAP ratio excludes Retail Banking's core deposit intangible amortization expense related to the Bank of New York transaction and the Bank One merger of $328 million, $394 million and $460 million for the years ended December 31, 2009, 2008 and 2007, respectively.

2009 compared with 2008

Net income was $97 million, a decrease of $783 million from the prior year, as the increase in provision for credit losses more than offset the positive impact of the Washington Mutual transaction.

Net revenue was $32.7 billion, an increase of $9.2 billion, or 39%, from the prior year. Net interest income was $20.5 billion, up by $6.3 billion, or 45%, reflecting the impact of the Washington Mutual transaction, and wider loan and deposit spreads. Noninterest revenue was $12.2 billion, up by $2.8 billion, or 30%, driven by the impact of the Washington Mutual transaction, wider margins on mortgage originations and higher net mortgage servicing revenue, partially offset by $1.6 billion in estimated losses related to the repurchase of previously sold loans.

The provision for credit losses was $15.9 billion, an increase of $6.0 billion from the prior year. Weak economic conditions and housing price declines continued to drive higher estimated losses for the home equity and mortgage loan portfolios. The provision included an addition of $5.8 billion to the allowance for loan losses, compared with an addition of $5.0 billion in the prior year. Included in the 2009 addition to the allowance for loan losses was a $1.6 billion increase related to estimated deterioration in the Washington Mutual purchased credit-impaired portfolio. To date, no charge-offs have been recorded on purchased credit-impaired loans; see page 70 of this Annual Report for the net charge-off rates, as reported. Home equity net charge-offs were $4.7 billion (4.32% excluding purchased credit-impaired loans), compared with $2.4 billion (2.39% excluding purchased credit-impaired loans) in the prior year. Subprime mortgage net charge-offs were $1.6 billion (11.86% excluding purchased credit-impaired loans), compared with $933 million (6.10% excluding purchased credit-impaired loans) in the prior year. Prime mortgage net charge-offs were $1.9 billion (3.05% excluding purchased credit-impaired loans), compared with $526 million (1.18% excluding purchased credit-impaired loans) in the prior year.

Noninterest expense was $16.7 billion, an increase of $4.7 billion, or 39%. The increase reflected the impact of the Washington Mutual transaction and higher servicing and default-related expense.

2008 compared with 2007

Net income was $880 million, a decrease of $2.0 billion, or 70%, from the prior year, as a significant increase in the provision for credit losses was partially offset by positive MSR risk management results and the positive impact of the Washington Mutual transaction.

Total net revenue was $23.5 billion, an increase of $6.2 billion, or 36%, from the prior year. Net interest income was $14.2 billion, up $3.6 billion, or 35%, benefiting from the Washington Mutual transaction, wider loan and deposit spreads, and higher loan and deposit balances. Noninterest revenue was $9.4 billion, up $2.6 billion, or 38%, as positive MSR risk management results, the impact of the Washington Mutual transaction, higher mortgage origination volume and higher deposit-related fees were partially offset by an increase in losses related to the repurchase of previously sold loans and markdowns on the mortgage warehouse.

The provision for credit losses was $9.9 billion, an increase of $7.3 billion from the prior year. Delinquency rates have increased due to overall weak economic conditions, while housing price declines have continued to drive increased loss severities, particularly for high loan-to-value home equity and mortgage loans. The provision includes $4.7 billion in additions to the allowance for loan losses for the heritage Chase home equity and mortgage portfolios. Home equity net charge-offs were $2.4 billion (2.23% net charge-off rate; 2.39% excluding purchased credit-impaired loans), compared with $564 million (0.62% net charge-off rate) in the prior year. Subprime mortgage net charge-offs were $933 million (5.49% net charge-off rate; 6.10% excluding purchased credit-impaired loans), compared with $157 million (1.55% net charge-off rate) in the prior year. Prime mortgage net charge-offs were $526 million (1.05% net charge-off rate; 1.18% excluding purchased credit-impaired loans), compared with $33 million (0.13% net charge-off rate) in the prior year. The provision for credit losses was also affected by an increase in estimated losses for the auto, student and business banking loan portfolios.

Total noninterest expense was $12.1 billion, an increase of $2.2 billion, or 22%, from the prior year, reflecting the impact of the Washington Mutual transaction, higher mortgage reinsurance losses, higher mortgage servicing expense and investments in the retail distribution network.

Nonperforming loans to total loans excluding purchased credit-impaired loans	**3.96**	2.34	1.24

(a) Loans at fair value consist of prime mortgage loans originated with the intent to sell that are accounted for at fair value and classified as trading assets on the Consolidated Balance Sheets. These loans totaled $12.5 billion, $8.0 billion and $12.6 billion at December 31, 2009, 2008 and 2007, respectively. Average balances of these loans totaled $15.8 billion, $14.2 billion and $11.9 billion for the years ended December 31, 2009, 2008 and 2007, respectively.

(b) Excludes purchased credit-impaired loans that were acquired as part of the Washington Mutual transaction. These loans were accounted for on a pool basis, and the pools are considered to be performing.

(c) Certain of these loans are classified as trading assets on the Consolidated Balance Sheets.

(d) At December 31, 2009, 2008 and 2007, nonperforming loans and assets excluded: (1) mortgage loans insured by U.S. government agencies of $9.0 billion, $3.0 billion and $1.1 billion, respectively; (2) real estate owned insured

by U.S. government agencies of $579 million, $364 million and $452 million, respectively; and (3) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program, of $542 million, $437 million and $417 million, respectively. These amounts are excluded, as reimbursement is proceeding normally.

(e) Excludes the impact of purchased credit-impaired loans that were acquired as part of the Washington Mutual transaction. These loans were accounted for at fair value on the acquisition date, which incorporated management's estimate, as of that date, of credit losses over the remaining life of the portfolio. During 2009, an allowance for loan losses of $1.6 billion was recorded for these loans, which has also been excluded from applicable ratios. To date, no charge-offs have been recorded for these loans.

(f) Loans held-for-sale and loans accounted for at fair value were excluded when calculating the allowance coverage ratio and net charge-off rate.

Retail Banking

Selected income statement data

Year ended December 31, (in millions, except ratios)	2009	2008	2007
Noninterest revenue	**$ 7,169**	$ 4,951	$ 3,763
Net interest income	**10,781**	7,659	6,193
Total net revenue	**17,950**	12,610	9,956
Provision for credit losses	**1,142**	449	79
Noninterest expense	**10,357**	7,232	6,166
Income before income tax expense	**6,451**	4,929	3,711
Net income	**$ 3,903**	$ 2,982	$ 2,245
Overhead ratio	**58%**	57%	62%
Overhead ratio excluding core deposit intangibles[a]	**56**	54	57

(a) Retail Banking uses the overhead ratio (excluding the amortization of CDI), a non-GAAP financial measure, to evaluate the underlying expense trends of the business. Including CDI amortization expense in the overhead ratio calculation would result in a higher overhead ratio in the earlier years and a lower overhead ratio in later years; this method would therefore result in an improving overhead ratio over time, all things remaining equal. The non-GAAP ratio excludes Retail Banking's core deposit intangible amortization expense related to the Bank of New York transaction and the Bank One merger of $328 million, $394 million and $460 million for the years ended December 31, 2009, 2008 and 2007, respectively.

2009 compared with 2008

Retail Banking reported net income of $3.9 billion, up by $921 million, or 31%, from the prior year. Total net revenue was $18.0 billion, up by $5.3 billion, or 42%, from the prior year. The increase reflected the impact of the Washington Mutual transaction, wider deposit spreads, higher average deposit balances and higher debit card income. The provision for credit losses was $1.1 billion, compared with $449 million in the prior year, reflecting higher estimated losses in the Business Banking portfolio. Noninterest expense was $10.4 billion, up by $3.1 billion, or 43%. The increase reflected the impact of the Washington Mutual transaction, higher FDIC insurance premiums and higher headcount-related expense.

2008 compared with 2007

Retail Banking net income was $3.0 billion, up $737 million, or 33%, from the prior year. Total net revenue was $12.6 billion, up $2.7 billion, or 27%, reflecting the impact of the Washington Mutual transaction, wider deposit spreads, higher deposit-related fees, and higher deposit balances. The provision for credit losses was $449 million, compared with $79 million in the prior year, reflecting an increase in the allowance for loan losses for Business Banking loans due to higher estimated losses on the portfolio. Noninterest expense was $7.2 billion, up $1.1 billion, or 17%, from the prior year, due to the Washington Mutual transaction and investments in the retail distribution network.

2009 compared with 2008

Consumer Lending reported a net loss of $3.8 billion, compared with a net loss of $2.1 billion in the prior year.

Net revenue was $14.7 billion, up by $3.8 billion, or 35%, from the prior year. The increase was driven by the impact of the Washington Mutual transaction, wider loan spreads and higher mortgage fees and related income, partially offset by lower heritage Chase loan balances. Mortgage production revenue was $503 million,

down $395 million from the prior year, as an increase in losses from the repurchase of previously-sold loans was predominantly offset by wider margins on new originations. Operating revenue, which represents loan servicing revenue net of other changes in fair value of the MSR asset, was $1.7 billion, compared with $1.2 billion in the prior year, reflecting growth in average third-party loans serviced as a result of the Washington Mutual transaction. MSR risk management results were $1.6 billion, compared with $1.5 billion in the prior year, reflecting the positive impact of a decrease in estimated future mortgage prepayments during 2009.

The provision for credit losses was $14.8 billion, compared with $9.5 billion in the prior year, reflecting continued weakness in the home equity and mortgage loan portfolios (see Retail Financial Services discussion of the provision for credit losses, above on page 66 and Allowance for Credit Losses on pages 123–125 of this Annual Report, for further detail).

Noninterest expense was $6.4 billion, up by $1.5 billion, or 32%, from the prior year, reflecting higher servicing and default-related expense and the impact of the Washington Mutual transaction.

2008 compared with 2007

Consumer Lending net loss was $2.1 billion, compared with net income of $680 million in the prior year. Total net revenue was $10.9 billion, up $3.6 billion, or 48%, driven by higher mortgage fees and related income, the impact of the Washington Mutual transaction, higher loan balances and wider loan spreads.

The increase in mortgage fees and related income was primarily driven by higher net mortgage servicing revenue. Mortgage production revenue of $898 million was up $18 million, as higher mortgage origination volume was predominantly offset by an increase in losses related to the repurchase of previously sold loans and markdowns of the mortgage warehouse. Operating revenue, which represents loan servicing revenue net of other changes in fair value of the MSR asset was $1.2 billion, an increase of $403 million, or 50%, from the prior year reflecting growth in average third-party loans serviced which increased 42%, primarily due to the Washington Mutual transaction. MSR risk management results were $1.5 billion, compared with $411 million in the prior year.

The provision for credit losses was $9.5 billion, compared with $2.5 billion in the prior year. The provision reflected weakness in the home equity and mortgage portfolios (see Retail Financial Services discussion of the provision for credit losses for further detail).

Noninterest expense was $4.8 billion, up $1.1 billion, or 30%, from the prior year, reflecting higher mortgage reinsurance losses, the impact of the Washington Mutual transaction and higher servicing expense due to increased delinquencies and defaults.

Allowance for loan losses to ending loans	**4.27%**	2.36%	1.24%
Allowance for loan losses to ending loans excluding purchased credit-impaired loans[a]	**5.04**	3.16	1.24

(a) Excludes the impact of purchased credit-impaired loans that were acquired as part of the Washington Mutual transaction. These loans were accounted for at fair value on the acquisition date, which incorporated management's estimate, as of that date, of the credit losses over the remaining life of the portfolio. During 2009, an allowance for loan losses of $1.6 billion was recorded for these loans, which has also been excluded from applicable ratios. To date, no charge-offs have been recorded for these loans.

(b) Average loans included loans held-for-sale of $2.2 billion, $2.8 billion and $10.6 billion for the years ended December 31, 2009, 2008 and 2007, respectively, which were excluded when calculating the net charge-off rate.

(c) Excluded mortgage loans that are insured by U.S. government agencies of $9.7 billion, $3.5 billion and $1.4 billion at December 31, 2009, 2008 and 2007, respectively. These amounts were excluded, as reimbursement is proceeding normally.

(d) Excluded loans that are 30 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program of $942 million, $824 million and $663 million at December 31, 2009, 2008 and 2007, respectively. These amounts are excluded, as reimbursement is proceeding normally.

(e) The delinquency rate for purchased credit-impaired loans was 27.79% and 17.89% at December 31, 2009 and 2008, respectively.

(f) At December 31, 2009, 2008 and 2007, nonperforming assets excluded: (1) mortgage loans insured by U.S. government agencies of $9.0 billion, $3.0 billion and $1.1 billion, respectively; (2) real estate owned insured by U.S. government agencies of $579 million, $364 million and $452 million, respectively; and (3) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program, of $542 million, $437 million and $417 million, respectively. These amounts are excluded, as reimbursement is proceeding normally.

(g) Excludes purchased credit-impaired loans that were acquired as part of the Washington Mutual transaction. These loans are accounted for on a pool basis, and the pools are considered to be performing.

MSR revenue multiple[c]	**3.25x**	1.98x	3.41x

(a) Includes rural housing loans sourced through brokers and underwritten under U.S. Department of Agriculture guidelines.

(b) Loans at fair value consist of prime mortgages originated with the intent to sell that are accounted for at fair value and classified as trading assets on the Consolidated Balance Sheets. Average balances of these loans totaled $15.8 billion, $14.2 billion and $11.9 billion for the years ended December 31, 2009, 2008 and 2007, respectively.

(c) Represents the ratio of MSR net carrying value (ending) to third-party mortgage loans serviced (ending) divided by the ratio of annualized loan servicing revenue to third-party mortgage loans serviced (average).

Mortgage origination channels comprise the following:

Retail – Borrowers who are buying or refinancing a home through direct contact with a mortgage banker employed by the Firm using a branch office, the Internet or by phone. Borrowers are frequently referred to a mortgage banker by a banker in a Chase branch, real estate brokers, home builders or other third parties.

Wholesale – A third-party mortgage broker refers loan applications to a mortgage banker at the Firm. Brokers are independent loan originators that specialize in finding and counseling borrowers but do not provide funding for loans. The Firm exited the broker channel during 2008.

Correspondent – Banks, thrifts, other mortgage banks and other financial institutions that sell closed loans to the Firm.

Correspondent negotiated transactions ("CNTs") – These transactions occur when mid- to large-sized mortgage lenders, banks and bank-owned mortgage companies sell servicing to the Firm on an as-originated basis, and exclude purchased bulk servicing transactions. These transactions supplement traditional production channels and provide growth opportunities in the servicing portfolio in stable and rising-rate periods.

Production revenue – Includes net gains or losses on originations and sales of prime and subprime mortgage loans, other production-related fees and losses related to the repurchase of previously sold loans.

Net mortgage servicing revenue includes the following components:

(a) Operating revenue comprises:
- all gross income earned from servicing third-party mortgage loans including stated service fees, excess service fees, late fees and other ancillary fees.
- modeled servicing portfolio runoff (or time decay).

(b) Risk management comprises:
- changes in MSR asset fair value due to market-based inputs such as interest rates and volatility, as well as updates to assumptions used in the MSR valuation model.
- derivative valuation adjustments and other, which represents changes in the fair value of derivative instruments used to offset the impact of changes in the market-based inputs to the MSR valuation model.

CARD SERVICES

Card Services is one of the nation's largest credit card issuers, with more than 145 million credit cards in circulation and over $163 billion in managed loans. Customers used Chase cards to meet more than $328 billion of their spending needs in 2009.

Chase continues to innovate, despite a very difficult business environment, launching new products and services such as Blueprint, Ultimate Rewards, Chase Sapphire and Ink from Chase, and earning a market leadership position in building loyalty and rewards programs. Through its merchant acquiring business, Chase Paymentech Solutions, Chase is one of the leading processors of credit-card payments.

JPMorgan Chase uses the concept of "managed basis" to evaluate the credit performance of its credit card loans, both loans on the balance sheet and loans that have been securitized. For further information, see Explanation and Reconciliation of the Firm's Use of Non-GAAP Financial Measures on pages 58–60 of this Annual Report. Managed results exclude the impact of credit card securitizations on total net revenue, the provision for credit losses, net charge-offs and loan receivables. Securitization does not change reported net income; however, it does affect the classification of items on the Consolidated Statements of Income and Consolidated Balance Sheets.

The following discussion of CS's financial results reflects the acquisition of Washington Mutual's credit cards operations, as a result of the Washington Mutual transaction on September 25, 2008, and the dissolution of the Chase Paymentech Solutions joint venture on November 1, 2008. See Note 2 on pages 151–156 of this Annual Report for more information concerning these transactions.

2009 compared with 2008

Card Services reported a net loss of $2.2 billion, compared with net income of $780 million in the prior year. The decrease was driven by a higher provision for credit losses, partially offset by higher total net revenue.

End-of-period managed loans were $163.4 billion, a decrease of $26.9 billion, or 14%, from the prior year, reflecting lower charge volume and a higher level of charge-offs. Average managed loans were $172.4 billion, an increase of $9.5 billion, or 6%, from the prior year, primarily due to the impact of the Washington Mutual transaction. Excluding the impact of the Washington Mutual transaction, end-of-period and average managed loans for 2009 were $143.8 billion and $148.8 billion, respectively.

Managed total net revenue was $20.3 billion, an increase of $3.8 billion, or 23%, from the prior year. Net interest income was $17.4 billion, up by $3.6 billion, or 26%, from the prior year, driven by wider loan spreads and the impact of the Washington Mutual transaction. These benefits were offset partially by higher revenue reversals associated with higher charge-offs, a decreased level of fees, lower average managed loan balances, and the impact of legislative changes. Noninterest revenue was $2.9 billion, an increase of $201 million, or 7%, from the prior year. The increase was driven by higher merchant servicing revenue related to the dissolution of the Chase Paymentech Solutions joint venture and the impact of the Washington Mutual transaction, partially offset by lower securitization income.

The managed provision for credit losses was $18.5 billion, an increase of $8.4 billion from the prior year, reflecting a higher level of charge-offs and an addition of $2.4 billion to the allowance for loan losses, reflecting continued weakness in the credit environment. The managed net charge-off rate was 9.33%, up from 5.01% in the prior year. The 30-day managed delinquency rate was 6.28%, up from 4.97% in the prior year. Excluding the impact of the Washington Mutual transaction, the managed net charge-off rate was 8.45%, and the 30-day managed delinquency rate was 5.52%.

Noninterest expense was $5.4 billion, an increase of $241 million, or 5%, from the prior year, due to the dissolution of the Chase Paymentech Solutions joint venture and the impact of the Washington Mutual transaction, partially offset by lower marketing expense.

2008 compared with 2007

Net income was $780 million, a decline of $2.1 billion, or 73%, from the prior year. The decrease was driven by a higher provision for credit losses, partially offset by higher total net revenue.

Average managed loans were $162.9 billion, an increase of $13.5 billion, or 9%, from the prior year. End-of-period managed loans were $190.3 billion, an increase of $33.3 billion, or 21%, from the prior year. Excluding Washington Mutual, average managed loans were $155.9 billion and end-of-period managed loans were $162.1

billion. The increases in both average managed loans and end-of-period managed loans were predominantly due to the impact of the Washington Mutual transaction and organic portfolio growth.

Managed total net revenue was $16.5 billion, an increase of $1.2 billion, or 8%, from the prior year. Net interest income was $13.8 billion, up $1.6 billion, or 13%, from the prior year, driven by the Washington Mutual transaction, higher average managed loan balances, and wider loan spreads. These benefits were offset partially by the effect of higher revenue reversals associated with higher charge-offs. Noninterest revenue was $2.7 billion, a decrease of $327 million, or 11%, from the prior year, driven by increased rewards expense, lower securitization income driven by higher credit losses, and higher volume-driven payments to partners; these were largely offset by increased interchange income, benefiting from a 4% increase in charge volume, as well as the impact of the Washington Mutual transaction.

The managed provision for credit losses was $10.1 billion, an increase of $4.3 billion, or 76%, from the prior year, due to an increase of $1.7 billion in the allowance for loan losses and a higher level of charge-offs. The managed net charge-off rate increased to 5.01%, up from 3.68% in the prior year. The 30-day managed delinquency rate was 4.97%, up from 3.48% in the prior year. Excluding Washington Mutual, the managed net charge-off rate was 4.92% and the 30-day delinquency rate was 4.36%.

Noninterest expense was $5.1 billion, an increase of $226 million, or 5%, from the prior year, predominantly due to the impact of the Washington Mutual transaction.

The following are brief descriptions of selected business metrics within Card Services.

- **Charge volume** – Dollar amount of cardmember purchases, balance transfers and cash advance activity.
- **Net accounts opened** – Includes originations, purchases and sales.
- **Merchant acquiring business** – A business that processes bank card transactions for merchants.
- **Bank card volume** – Dollar amount of transactions processed for merchants.
- **Total transactions** – Number of transactions and authorizations processed for merchants.

(a) Represents total net revenue less provision for credit losses.

(b) Pretax return on average managed outstandings.

(c) Results for 2008 included approximately 13 million credit card accounts acquired by JPMorgan Chase in the Washington Mutual transaction.

(d) The Chase Paymentech Solutions joint venture was dissolved effective November 1, 2008. JPMorgan Chase retained approximately 51% of the business and operates the business under the name Chase Paymentech Solutions. For the period January 1 through October 31, 2008, the data presented represents activity for the Chase Paymentech Solutions joint venture, and for the period November 1, 2008, through December 31, 2009, the data presented represents activity for Chase Paymentech Solutions.

(e) Results for 2009 and 2008 reflect the impact of purchase accounting adjustments related to the Washington Mutual transaction and the consolidation of the Washington Mutual Master Trust.

(f) Based on loans on balance sheets ("reported basis").

(g) The 2008 allowance for loan losses included an amount related to loans acquired in the Washington Mutual transaction.

(h) Includes $1.0 billion of loans at December 31, 2009, held by the Washington Mutual Master Trust, which were consolidated onto the Card Services balance sheet at fair value during the second quarter of 2009. No allowance for loan losses was recorded for these loans as of December 31, 2009. Excluding these loans, the allowance for loan losses to period-end loans was 12.43%.

(i) Statistics are only presented for periods after September 25, 2008, the date of the Washington Mutual transaction.

(j) As a percentage of average managed outstandings.

(k) Excludes the impact of purchase accounting adjustments related to the Washington Mutual transaction and the consolidation of the Washington Mutual Master Trust.

The financial information presented below reconciles reported basis and managed basis to disclose the effect of securitizations.

(a) For a discussion of managed basis, see the non-GAAP financial measures discussion on pages 58–60 of this Annual Report.

Commercial Banking serves nearly 25,000 clients nationally, including corporations, municipalities, financial institutions and not-for-profit entities with annual revenue generally ranging from $10 million to $2 billion, and more than 30,000 real estate investors/owners. Delivering extensive industry knowledge, local expertise and dedicated service, CB partners with the Firm's other businesses to provide comprehensive solutions, including lending, treasury services, investment banking and asset management to meet its clients' domestic and international financial needs.

On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual from the FDIC, adding approximately $44.5 billion in loans to the Commercial Term Lending, Real Estate Banking and Other businesses in Commercial Banking.

Commercial Banking is divided into four primary client segments: Middle Market Banking, Commercial Term Lending, Mid-Corporate Banking, and Real Estate Banking. Middle Market Banking covers corporate, municipal, financial institution and not-for-profit clients, with annual revenue generally ranging between $10 million and $500 million. Mid-Corporate Banking covers clients with annual revenue generally ranging between $500 million and $2 billion and focuses on clients that have broader investment banking needs. Commercial Term Lending primarily provides term financing to real estate investors/owners for multi-family properties as well as financing office, retail and industrial properties. Real Estate Banking provides full-service banking to investors and developers of institutional-grade real estate properties.

(a) Revenue from investment banking products sold to CB clients and commercial card revenue is included in all other income.
(b) Represents the total revenue related to investment banking products sold to CB clients.
(c) Results for 2009 and 2008 include total net revenue on net assets acquired in the Washington Mutual transaction.

2009 compared with 2008

Net income was $1.3 billion, a decrease of $168 million, or 12%, from the prior year, as higher provision for credit losses and noninterest expense was partially offset by higher net revenue, reflecting the impact of the Washington Mutual transaction.

Record net revenue of $5.7 billion increased $943 million, or 20%, from the prior year. Net interest income of $3.9 billion increased $607 million, or 18%, driven by the impact of the Washington Mutual transaction. Noninterest revenue was $1.8 billion, an increase of $336 million, or 23%, from the prior year, reflecting higher lending- and deposit-related fees and higher investment banking fees and other income.

On a client-segment basis, revenue from Middle Market Banking was $3.1 billion, an increase of $116 million, or 4%, from the prior year due to higher liability balances, a shift to higher-spread liability products, wider loan spreads, higher lending- and deposit-related fees, and higher other income, partially offset by a narrowing of spreads on liability products and reduced loan balances. Revenue from Commercial Term Lending (a new client segment acquired in the Washington Mutual transaction encompassing multi-family and commercial mortgage loans) was $875 million, an increase of $632 million. Mid-Corporate Banking revenue was $1.1 billion, an increase of $181 million, or 20%, driven by higher investment banking fees, increased loan spreads, and higher lending- and deposit-related fees. Real Estate Banking revenue was $461 million, an increase of $48 million, or 12%, due to the impact of the Washington Mutual transaction.

The provision for credit losses was $1.5 billion, compared with $464 million in the prior year, reflecting continued weakness in the credit environment, predominantly in real estate-related segments. Net charge-offs were $1.1 billion (1.02% net charge-off rate), compared with $288 million (0.35% net charge-off rate) in the prior year. The allowance for loan losses to end-of-period loans retained was 3.12%, up from 2.45% in the prior year. Nonperforming loans were $2.8 billion, an increase of $1.8 billion from the prior year.

Noninterest expense was $2.2 billion, an increase of $230 million, or 12%, from the prior year, due to the impact of the Washington Mutual transaction and higher FDIC insurance premiums.

2008 compared with 2007

Net income was $1.4 billion, an increase of $305 million, or 27%, from the prior year, due to growth in total net revenue including the impact of the Washington Mutual transaction, partially offset by a higher provision for credit losses.

Record total net revenue of $4.8 billion increased $674 million, or 16%. Net interest income of $3.3 billion increased $456 million, or 16%, driven by double-digit growth in liability and loan balances and the impact of the Washington Mutual transaction, partially offset by spread compression in the liability and loan portfolios. Noninterest revenue was $1.5 billion, up $218 million, or 17%, due to higher deposit- and lending-related fees.

On a client-segment basis, Middle Market Banking revenue was $2.9 billion, an increase of $250 million, or 9%, from the prior year due predominantly to higher deposit-related fees and growth in liability and loan balances. Revenue from Commercial Term Lending, a new client segment acquired in the Washington Mutual transaction, was $243 million. Mid-Corporate Banking revenue was $921 million, an increase of $106 million, or 13%, reflecting higher loan balances, investment banking revenue and deposit-related fees. Real Estate Banking revenue of $413 million decreased $8 million, or 2%.

Provision for credit losses was $464 million, an increase of $185 million, or 66%, compared with the prior year, reflecting a weakening credit environment and loan growth. Net charge-offs were $288 million (0.35% net charge-off rate), compared with $44 million (0.07% net charge-off rate) in the prior year, predominantly related to an increase in real estate charge-offs. The allowance for loan losses increased by $1.1 billion, which primarily reflected the impact of the Washington Mutual transaction. Nonperforming assets were $1.1 billion, an increase of $1.0 billion compared with the prior year, predominantly reflecting the Washington Mutual transaction and higher real estate–related balances.

Noninterest expense was $1.9 billion, a decrease of $12 million, or 1%, from the prior year, due to lower performance-based incentive compensation and volume-based charges from service providers, predominantly offset by the impact of the Washington Mutual transaction.

(a) Liability balances include deposits and deposits swept to on–balance sheet liabilities such as commercial paper, federal funds purchased and securities loaned or sold under repurchase agreements.

(b) Results for 2009 and 2008 include loans acquired in the Washington Mutual transaction.

(c) Allowance for loan losses of $581 million, $208 million and $32 million were held against nonperforming loans retained for the periods ended December 31, 2009, 2008, and 2007, respectively.

(d) Beginning in 2008, the allowance for loan losses included an amount related to loans acquired in the Washington Mutual transaction and the Bear Stearns merger.

(e) Average loans in the calculation of this ratio were adjusted to include $44.5 billion of loans acquired in the Washington Mutual transaction as if the transaction occurred on July 1, 2008. Excluding this adjustment, the unadjusted allowance for loan losses to average loans retained and nonperforming loans to total average loans ratios would have been 3.45% and 1.25%, respectively, for the period ended December 31, 2008.

Treasury & Securities Services is a global leader in transaction, investment and information services. TSS is one of the world's largest cash management providers and a leading global custodian. Treasury Services provides cash management, trade, wholesale card and liquidity products and services to small and mid-sized companies, multinational corporations, financial institutions and government entities. TS partners with the Commercial Banking, Retail Financial Services and Asset Management businesses to serve clients firmwide. As a result, certain TS revenue is included in other segments' results. Worldwide Securities Services holds, values, clears and services securities, cash and alternative investments for investors and broker-dealers, and it manages depositary receipt programs globally.

(a) IB credit portfolio group manages certain exposures on behalf of clients shared with TSS. TSS reimburses IB for a portion of the total cost of managing the credit portfolio. IB recognizes this credit reimbursement as a component of noninterest revenue.

(b) Reflects an internal reorganization for escrow products from Worldwide Securities Services to Treasury Services revenue of $168 million, $224 million and $177 million for the years ended December 31, 2009, 2008 and 2007, respectively.

(c) Pretax margin represents income before income tax expense divided by total net revenue, which is a measure of pretax performance and another basis by which management evaluates its performance and that of its competitors.

(d) Loan balances include wholesale overdrafts, commercial card and trade finance loans.

(e) Liability balances include deposits and deposits swept to on–balance sheet liabilities, such as commercial paper, federal funds purchased and securities loaned or sold under repurchase agreements.

2009 compared with 2008

Net income was $1.2 billion, a decrease of $541 million, or 31%, from the prior year, driven by lower net revenue.

Net revenue was $7.3 billion, a decrease of $790 million, or 10%, from the prior year. Worldwide Securities Services net revenue was $3.6 billion, a decrease of $713 million, or 16%. The decrease was driven by lower securities lending balances, primarily as a result of declines in asset valuations and demand, lower balances and spreads on liability products, and the effect of market depreciation on certain custody assets. Treasury Services net revenue was $3.7 billion, a decrease of $77 million, or 2%, reflecting spread compression on deposit products, offset by higher trade revenue driven by wider spreads and growth across cash management and card product volumes.

TSS generated firmwide net revenue of $10.2 billion, including $6.6 billion of net revenue in Treasury Services; of that amount, $3.7 billion was recorded in the Treasury Services business, $2.6 billion was recorded in the Commercial Banking business, and $245 million was recorded in other lines of business. The remaining $3.6 billion of net revenue was recorded in Worldwide Securities Services.

The provision for credit losses was $55 million, a decrease of $27 million from the prior year.

Noninterest expense was $5.3 billion, an increase of $55 million from the prior year. The increase was driven by higher FDIC insurance premiums, predominantly offset by lower headcount-related expense.

2008 compared with 2007

Net income was a record $1.8 billion, an increase of $370 million, or 26%, from the prior year, driven by higher total net revenue. This increase was largely offset by higher noninterest expense.

Total net revenue was a record $8.1 billion, an increase of $1.2 billion, or 17%, from the prior year. Worldwide Securities Services posted record net revenue of $4.4 billion, an increase of $600 million, or 16%, from the prior year. The growth was driven by wider spreads in securities lending, foreign exchange and liability products, increased product usage by new and existing clients (largely in custody, fund services, alternative investment services and depositary receipts) and higher liability balances, reflecting increased client deposit activity resulting from recent market conditions. These benefits were offset partially by market depreciation. Treasury Services posted record net revenue of $3.8 billion, an increase of $589 million, or 18%, reflecting higher liability balances and volume growth in electronic funds transfer products and trade loans. Revenue growth from higher liability balances reflects increased client deposit activity resulting from recent market conditions as well as organic growth. TSS firmwide net revenue, which includes Treasury Services net revenue recorded in other lines of business, grew to $11.1 billion, an increase of $1.5 billion, or 16%. Treasury Services firmwide net revenue grew to $6.7 billion, an increase of $916 million, or 16%.

Noninterest expense was $5.2 billion, an increase of $643 million, or 14%, from the prior year, reflecting higher expense related to business and volume growth as well as continued investment in new product platforms.

(a) Reflects an internal reorganization for escrow products from Worldwide Securities Services to Treasury Services revenue of $168 million, $224 million and $177 million for the years ended December 31, 2009, 2008 and 2007, respectively.

(b) TSS firmwide revenue includes FX revenue recorded in TSS and FX revenue associated with TSS customers who are FX customers of IB. However, some of the FX revenue associated with TSS customers who are FX customers of IB is not included in TS and TSS firmwide revenue. These amounts were $661 million, $880 million and $552 million, for the years ended December 31, 2009, 2008 and 2007, respectively.

(c) Firmwide liability balances include liability balances recorded in CB.

(d) Reflects an internal reorganization for escrow products, from Worldwide Securities Services to TS liability balances, of $15.6 billion, $21.5 billion and $18.1 billion for the years ended December 31, 2009, 2008 and 2007, respectively.

(e) Overhead ratios have been calculated based on firmwide revenue and TSS and TS expense, respectively, including those allocated to certain other lines of business. FX revenue and expense recorded in IB for TSS-related FX activity are not included in this ratio.

(f) International electronic funds transfer includes non-U.S. dollar ACH and clearing volume.

(g) Wholesale cards issued include domestic commercial, stored value, prepaid and government electronic benefit card products.

Asset Management, with assets under supervision of $1.7 trillion, is a global leader in investment and wealth management. AM clients include institutions, retail investors and high-net-worth individuals in every major market throughout the world. AM offers global investment management in equities, fixed income, real estate, hedge funds, private equity and liquidity, including money market instruments and bank deposits. AM also provides trust and estate, banking and brokerage services to high-net-worth clients, and retirement services for corporations and individuals. The majority of AM's client assets are in actively managed portfolios.

(a) In 2008, certain clients were transferred from Private Bank to Private Wealth Management. Prior periods have been revised to conform to this change.
(b) Bear Stearns Private Client Services was renamed to JPMorgan Securities at the beginning of 2010.
(c) Pretax margin represents income before income tax expense divided by total net revenue, which is a measure of pretax performance and another basis by which management evaluates its performance and that of its competitors.

2009 compared with 2008

Net income was $1.4 billion, an increase of $73 million, or 5%, from the prior year, due to higher total net revenue, offset largely by higher noninterest expense and provision for credit losses.

Total net revenue was $8.0 billion, an increase of $381 million, or 5%, from the prior year. Noninterest revenue was $6.4 billion, an increase of $306 million, or 5%, due to higher valuations of seed capital investments and net inflows, offset largely by lower market levels. Net interest income was $1.6 billion, up by $75 million, or 5%, from the prior year, due to wider loan spreads and higher deposit balances, offset partially by narrower deposit spreads.

Revenue from the Private Bank was $2.6 billion, up 1% from the prior year due to wider loan spreads and higher deposit balances, offset partially by the effect of lower market levels. Revenue from Institutional was $2.1 billion, up 16% due to higher valuations of seed capital investments and net inflows, offset partially by the effect of lower market levels. Revenue from Retail was $1.6 billion, down 2% due to the effect of lower market levels, offset largely by higher valuations of seed capital investments. Revenue from Private Wealth Management was $1.3 billion, down 5% due to narrower deposit spreads and the effect of lower market levels, offset partially by higher deposit balances and wider loan spreads. Bear Stearns Private Client Services contributed $419 million to revenue.

The provision for credit losses was $188 million, an increase of $103 million from the prior year, reflecting continued weakness in the credit environment.

Noninterest expense was $5.5 billion, an increase of $175 million, or 3%, from the prior year due to the effect of the Bear Stearns merger, higher performance-based compensation and higher FDIC insurance premiums, offset largely by lower headcount-related expense.

2008 compared with 2007

Net income was $1.4 billion, a decline of $609 million, or 31%, from the prior year, driven by lower total net revenue offset partially by lower noninterest expense.

Total net revenue was $7.6 billion, a decrease of $1.1 billion, or 12%, from the prior year. Noninterest revenue was $6.1 billion, a decline of $1.4 billion, or 19%, due to lower performance fees and the effect of market levels, including the impact of lower market valuations of seed capital investments. The lower results were offset partially by the benefit of the Bear Stearns merger and increased revenue from net asset inflows. Net interest income was $1.5 billion, up $358 million, or 31%, from the prior year, due to higher deposit and loan balances and wider deposit spreads.

Private Bank revenue grew 9% to $2.6 billion, due to increased deposit and loan balances and net asset inflows, partially offset by the effect of lower markets and lower performance fees. Institutional revenue declined 30% to $1.8 billion due to lower performance fees, partially offset by net liquidity inflows. Retail revenue declined 33% to $1.6 billion due to the effect of lower markets, including the impact of lower market valuations of seed capital investments and net equity outflows. Private Wealth Management revenue grew 4% to $1.4 billion due to higher deposit and loan balances. Bear Stearns Brokerage contributed $237 million to revenue.

The provision for credit losses was $85 million, compared with a benefit of $18 million in the prior year, reflecting a weakening credit environment.

Noninterest expense was $5.3 billion, down $217 million, or 4%, compared with the prior year due to lower performance-based compensation, largely offset by the effect of the Bear Stearns merger and higher compensation expense resulting from increased average headcount.

AM's client segments comprise the following:

Institutional brings comprehensive global investment services – including asset management, pension analytics, asset-liability management and active risk-budgeting strategies – to corporate and public institutions, endowments, foundations, not-for-profit organizations and governments worldwide.

Retail provides worldwide investment management services and retirement planning and administration, through third-party and direct distribution of a full range of investment vehicles.

The **Private Bank** addresses every facet of wealth management for ultra-high-net-worth individuals and families worldwide, including investment management, capital markets and risk management, tax and estate planning, banking, capital raising and specialty-wealth advisory services.

Private Wealth Management offers high-net-worth individuals, families and business owners in the United States comprehensive wealth management solutions, including investment management, capital markets and risk management, tax and estate planning, banking and specialty-wealth advisory services.

Bear Stearns Private Client Services (renamed to JPMorgan Securities at the beginning of 2010) provides investment advice and wealth management services to high-net-worth individuals, money managers, and small corporations.

J.P. Morgan Asset Management has established two high-level measures of its overall performance.

- Percentage of assets under management in funds rated 4 and 5 stars (3 year). Mutual fund rating services rank funds based on their risk-adjusted performance over various periods. A 5 star rating is the best and represents the top 10% of industry wide ranked funds. A 4 star rating represents the next 22% of industry wide ranked funds. The worst rating is a 1 star rating.
- Percentage of assets under management in first- or second-quartile funds (one, three and five years). Mutual fund rating services rank funds according to a peer-based performance system, which measures returns according to specific time and fund classification (small, mid, multi and large cap).

Assets under supervision

2009 compared with 2008

Assets under supervision were $1.7 trillion, an increase of $205 billion, or 14%, from the prior year. Assets under management were $1.2 trillion, an increase of $116 billion, or 10%, from the prior year. The increases were due to the effect of higher market valuations and inflows in fixed income and equity products offset partially by outflows in cash products. Custody, brokerage, administration and deposit balances were $452 billion, up by $89 billion, due to the effect of higher market levels on custody and brokerage balances, and brokerage inflows in the Private Bank. The Firm also has a 42% interest in American Century Companies, Inc., whose AUM totaled $86 billion and $70 billion at December 31, 2009 and 2008, respectively, which are excluded from the AUM above.

2008 compared with 2007

Assets under supervision were $1.5 trillion, a decrease of $76 billion, or 5%, from the prior year. Assets under management were $1.1 trillion, down $60 billion, or 5%, from the prior year. The decrease was due to the effect of lower market valuations and non-liquidity outflows, predominantly offset by liquidity product inflows across all segments and the addition of Bear Stearns assets under management. Custody, brokerage, administration and deposit balances were $363 billion, down $16 billion due to the effect of lower markets on brokerage and custody balances, offset by the addition of Bear Stearns Brokerage. The Firm also has a 43% interest in American Century Companies, Inc., whose AUM totaled $70 billion and $102 billion at December 31, 2008 and 2007, respectively, which are excluded from the AUM above.

Ending balance, December 31	**$ 1,701**	$ 1,496	$ 1,572

(a) Excludes assets under management of American Century Companies, Inc., in which the Firm had a 42%, 43% and 44% ownership at December 31, 2009, 2008 and 2007, respectively.
(b) In 2008, certain clients were transferred from Private Bank to Private Wealth Management. Prior periods have been revised to conform to this change.
(c) Bear Stearns Private Client Services was renamed to JPMorgan Securities at the beginning of 2010.
(d) Includes $15 billion for assets under management and $68 billion for assets under supervision from the Bear Stearns merger in the second quarter of 2008.

CORPORATE/PRIVATE EQUITY

The Corporate/Private Equity sector comprises Private Equity, Treasury, the Chief Investment Office, corporate staff units and expense that is centrally managed. Treasury and the Chief Investment Office manage capital, liquidity, interest rate and foreign exchange risk and the investment portfolio for the Firm. The corporate staff units include Central Technology and Operations, Internal Audit, Executive Office, Finance, Human Resources, Marketing & Communications, Legal & Compliance, Corporate Real Estate and General Services, Risk Management, Corporate Responsibility and Strategy & Development. Other centrally managed expense includes the Firm's occupancy and pension-related expense, net of allocations to the business.

Total noninterest expense	**1,895**	(28)	1,757
Income/(loss) before income tax expense/(benefit) and extraordinary gain	**4,659**	(1,884)	2,673
Income tax expense/(benefit)[g]	**1,705**	(535)	788
Income/(loss) before extraordinary gain	**2,954**	(1,349)	1,885
Extraordinary gain[h]	**76**	1,906	—
Net income	**$ 3,030**	$ 557	$ 1,885

(a) Included losses on preferred equity interests in Fannie Mae and Freddie Mac in 2008.
(b) The Firm adopted the new guidance for fair value in the first quarter of 2007. See Note 3 on pages 156–173 of this Annual Report for additional information.
(c) Included gain on sale of MasterCard shares in 2008.
(d) Included a gain from the dissolution of the Chase Paymentech Solutions joint venture and proceeds from the sale of Visa shares in its initial public offering in 2008.
(e) Represents an accounting conformity loan loss reserve provision related to the acquisition of Washington Mutual Bank's banking operations.
(f) Included $675 million FDIC special assessment during second quarter of 2009 and a release of credit card litigation reserves in 2008 and insurance recoveries related to settlement of the Enron and WorldCom class action litigations.
(g) Includes tax benefits recognized upon resolution of tax audits.
(h) Effective September 25, 2008, JPMorgan Chase acquired Washington Mutual's banking operations from the FDIC for $1.9 billion. The fair value of the Washington Mutual net assets acquired exceeded the purchase price, which resulted in negative goodwill. In accordance with U.S. GAAP for business combinations, nonfinancial assets that are not held-for-sale were written down against that negative goodwill. The negative goodwill that remained after writing down nonfinancial assets was recognized as an extraordinary gain in 2008. As a result of the final refinement of the purchase price allocation during the third quarter of 2009, the Firm recognized a $76 million increase in the extraordinary gain.
(i) In November 2008, the Firm transferred $5.8 billion of higher quality credit card loans from the legacy Chase portfolio to a securitization trust previously established by Washington Mutual ("the Trust"). As a result of converting higher credit quality Chase-originated on-book receivables to the Trust's seller's interest which has a higher overall loss rate reflective of the total assets within the Trust, approximately $400 million of incremental provision expense was recorded during the fourth quarter. This incremental provision expense was recorded in the Corporate segment as the action related to the acquisition of Washington Mutual's banking operations. For further discussion of credit card securitizations, see Note 15 on pages 206–213 of this Annual Report.
(j) Includes $9 million of credit card securitizations related to the Washington Mutual transaction.

2009 compared with 2008

Net income was $3.0 billion compared with $557 million in the prior year.

Net loss for Private Equity was $78 million compared with a net loss of $690 million in the prior year. Net revenue was $18 million, an increase of $981 million, reflecting Private Equity losses of $54 million compared with losses of $894 million. Noninterest expense was $141 million, an increase of $21 million.

Net income for Corporate was $3.7 billion, compared with $1.5 billion in the prior year. Current year results reflect higher levels of trading gains and net interest income, securities gains, an after-tax gain of $150 million from the sale of MasterCard shares, partially offset by a $419 million FDIC special assessment. Trading gains and net interest income increased due to the Chief Investment Office's ("CIO") significant purchases of mortgage-backed securities guaranteed by U.S. government agencies, corporate debt securities, U.S. Treasury and government agency securities and other asset-backed securities. These investments were generally associated with the management of interest rate risk and investment of cash resulting from the excess funding the Firm continued to experience during 2009. The increase in securities was partially offset by sales of higher-coupon instruments (part of repositioning the investment portfolio) as well as prepayments and maturities.

Selected income statement and balance sheet data for Treasury and CIO

Year ended December 31, (in millions)	2009	2008	2007
Treasury			
Securities gains[a]	**$ 1,147**	$ 1,652	$ 37
Investment securities portfolio (average)[b]	**324,037**	113,010	88,037
Investment securities portfolio (ending)[b]	**340,163**	192,564	76,480
Mortgage loans (average)	**7,427**	7,059	5,639
Mortgage loans (ending)	**8,023**	7,292	6,635

(a) Results for 2008 included a gain on the sale of MasterCard shares. All periods reflect repositioning of the Corporate investment securities portfolio and exclude gains/losses on securities used to manage risk associated with MSRs.
(b) Beginning in second quarter 2009, balances reflect Treasury and Chief Investment Office securities. Prior periods have been revised to conform with this change.

For further information on the investment portfolio, see Note 3 and Note 11 on pages 156–173 and 195–199, respectively, of this Annual Report. For further information on CIO VaR and the Firm's earnings-at-risk, see the Market Risk Management section on pages 126–132 of this Annual Report.

Prior year results included $955 million proceeds from the sale of Visa shares in its initial public offering, $627 million from the dissolution

of the Chase Payment Solutions joint venture, partially offset by losses of $642 million on preferred securities of Fannie Mae and Freddie Mac and a $248 million charge related to the offer to repurchases auction-rate securities.

Merger-related items were a net loss of $635 million compared with a loss of $211 million in the prior year. Bear Stearns net merger-related costs were $425 million compared with $836 million. The prior year included a net loss of $423 million, which represented JPMorgan Chase's 49.4% ownership in Bear Stearn's losses from April 8 to May 30, 2008. Washington Mutual net merger-related costs were $210 million, which included an extraordinary gain of $76 million, compared with a net gain of $625 million. The prior year included an extraordinary gain of $1.9 billion, conforming loan loss reserves of $911 million, credit card related loan loss reserves of $250 million and net merger-related costs of $120 million.

2008 compared with 2007

Net income for Corporate/Private Equity was $557 million, compared with net income of $1.9 billion in the prior year.

Net loss for Private Equity was $690 million, compared with net income of $2.2 billion in the prior year. Net revenue was a loss of $963 million, a decrease of $4.9 billion, reflecting Private Equity losses of $894 million, compared with gains of $4.1 billion in the prior year. Noninterest expense was $120 million, a decrease of $469 million from the prior year, reflecting lower compensation expense.

Net income for Corporate was $1.5 billion, compared with a net loss of $150 million in the prior year. 2008 included a gain of $955 million on the proceeds from the sale of Visa shares in its initial public offering, $627 million on the dissolution of the Chase Paymentech Solutions joint venture, and $414 million from the sale of MasterCard shares, partially offset by losses of $642 million on preferred securities of Fannie Mae and Freddie Mac and $303 million related to the offer to repurchase auction-rate securities. 2007 included a gain of $145 million on the sale of MasterCard shares.

Merger-related items were a net loss of $211 million, compared with a net loss of $130 million in the prior year. Items related to the Washington Mutual transaction included a $1.9 billion extraordinary gain, conforming loan loss reserves of $911 million, credit card related loan loss reserves of $250 million and net merger-related costs of $120 million. Bear Stearns merger-related items included a net loss of $423 million, which represented JPMorgan Chase's 49.4% ownership in Bear Stearn's losses from April 8 to May 30, 2008 and net merger-related costs of $413 million. Results for 2007 include merger costs of $130 million related to the Bank One and Bank of New York Transactions.

Total net income	**$ 3,030**	$ 557	$ 1,885
Headcount	**20,199**	23,376	22,512

(a) The Firm adopted the new guidance for fair value in the first quarter of 2007. See Note 3 on pages 156–173 of this Annual Report for additional information.
(b) Included $675 million FDIC special assessment during second quarter of 2009 and a release of credit card litigation reserves in 2008 and insurance recoveries related to settlement of the Enron and WorldCom class action litigations.
(c) Includes tax benefits recognized upon resolution of tax audits.
(d) Includes an accounting conformity loan loss reserve provision and an extraordinary gain related to the Washington Mutual transaction in 2008. 2008 also reflects items related to the Bear Stearns merger, which included Bear Stearns' equity earnings, merger costs, Bear Stearns asset management liquidation costs and Bear Stearns private client services broker retention expense. 2007 represent costs related to the Bank One transaction in 2004 and the Bank of New York transaction in 2006.

Private equity portfolio

2009 compared with 2008

The carrying value of the private equity portfolio at December 31, 2009, was $7.3 billion, up from $6.9 billion at December 31, 2008. The portfolio increase was primarily driven by additional follow-on investments and net unrealized gains on the existing portfolio, partially offset by sales during 2009. The portfolio represented 6.3% of the Firm's stockholders' equity less goodwill at December 31, 2009, up from 5.8% at December 31, 2008.

2008 compared with 2007

The carrying value of the private equity portfolio at December 31, 2008, was $6.9 billion, down from $7.2 billion at December 31, 2007. The portfolio decrease was primarily driven by unfavorable valuation adjustments on existing investments, partially offset by new investments, and the addition of the Bear Stearns portfolios. The portfolio represented 5.8% of the Firm's stockholders' equity less goodwill at December 31, 2008, down from 9.2% at December 31, 2007.

Consolidated Balance Sheets overview

The following is a discussion of the significant changes in the Consolidated Balance Sheets from December 31, 2008.

Deposits with banks; federal funds sold and securities purchased under resale agreements; and securities borrowed

The Firm uses these instruments as part of its liquidity management activities, to manage the Firm's cash positions and risk-based capital requirements, and to support the Firm's trading and risk management activities. In particular, the Firm uses securities purchased under resale agreements and securities borrowed to provide funding or liquidity to clients by purchasing and borrowing their securities for the short-term. The decrease in deposits with banks primarily reflected lower demand for interbank lending and lower deposits with the Federal Reserve Bank relative to the elevated levels at the end of 2008. The decrease in securities purchased under resale agreements was largely due to a shift by the Firm of its excess cash to the available-for-sale ("AFS") securities portfolio, offset partially by higher securities purchased under resale agreements in IB due to improved and more liquid market conditions.

For additional information on the Firm's Liquidity Risk Management, see pages 96–100 of this Annual Report.

Trading assets and liabilities – debt and equity instruments

Debt and equity trading instruments are used for both market-making and, to a limited extent, proprietary risk-taking activities. These instruments consist predominantly of fixed-income securities, including government and corporate debt; equity securities, including convertible securities; loans, including prime mortgage and other loans warehoused by RFS and IB for sale or securitization purposes and accounted for at fair value; and physical commodities inventories carried at the lower of cost or fair value. The decrease in trading assets – debt and equity instruments reflected the effect of balance sheet management activities and the impact of the challenging capital markets environment that existed during the latter part of 2008, which continued into the first half of 2009, partially offset by stabilization in the capital markets during the second half of 2009. Trading liabilities – debt and equity instruments increased as market conditions improved and capital markets stabilized from the prior year. For additional information, refer to Note 3 on pages 156–173 of this Annual Report.

Trading assets and liabilities – derivative receivables and payables

Derivative instruments enable end-users to transform or mitigate exposure to credit or market risks. The value of a derivative is derived from its reference to an underlying variable or combination of variables, such as interest rate, credit, foreign exchange, equity or commodity prices or indices. JPMorgan Chase makes markets in derivatives for customers and also uses derivatives to hedge or manage risks of market exposures and to make investments. The majority of the Firm's derivatives are entered into for market-making purposes. The decrease in derivative receivables and payables was primarily related to tightening credit spreads, volatile foreign exchange rates and rising rates on interest rate swaps. For additional information, refer to Derivative contracts on pages 110–112, and Note 3 and Note 5 on pages 156–173 and 175–183, respectively, of this Annual Report.

Securities

Substantially all of the securities portfolio is classified as AFS and is used primarily to manage the Firm's exposure to interest rate movements and to invest cash resulting from excess funding positions. The increase in the securities portfolio was due to elevated levels of excess cash, which was used to purchase mortgage-backed securities guaranteed by U.S. government agencies, corporate debt securities, U.S. Treasury and government agency securities and other asset-backed securities. The increase in securities was partially offset by sales of higher-coupon instruments, as part of positioning of the portfolio, as well as prepayments and maturities. For additional information related to securities, refer to the Corporate/Private Equity segment on pages 82–83, and Note 3 and Note 11 on pages 156–173 and 195–199, respectively, of this Annual Report.

Loans and allowance for loan losses
The Firm provides loans to a variety of customers, from large corporate and institutional clients to individual consumers. Loans decreased across most lines of business. Although gross new lending volumes remained at levels consistent with 2008, continued lower customer demand, repayments and charge-offs in the wholesale and consumer businesses resulted in lower balances. Lower charge volume on credit cards and the effect of tighter underwriting and loan qualification standards, also contributed to the decrease in loans.

The allowance for loan losses increased in both the consumer and wholesale businesses, as weak economic conditions, housing price declines and higher unemployment rates continued to drive higher estimated losses for most of the Firm's loan portfolios. For a more detailed discussion of the loan portfolio and the allowance for loan losses, refer to Credit Risk Management on pages 101–125, and Notes 3, 4, 13 and 14 on pages 156–173, 173–175, 200–204 and 204–206, respectively, of this Annual Report.

Accrued interest and accounts receivable
Accrued interest and accounts receivable consist of accrued interest receivables from interest-earning assets; receivables from customers (primarily from activities related to IB's Prime Services business); receivables from brokers, dealers and clearing organizations; and receivables from failed securities sales. The increase in accrued interest and accounts receivable primarily reflected higher accounts receivable associated with maturities of credit card securitizations, as well as slightly higher failed securities sales.

Other assets
Other assets consist of private equity and other investments, collateral received, corporate and bank-owned life insurance policies, assets acquired in loan satisfactions (including real estate owned) and all other assets, including receivables for securities provided as collateral. The decrease in other assets was primarily due to a decline to zero in the balance related to the Federal Reserve Bank of Boston AML Facility. This Facility was ended by the Federal Reserve Bank of Boston on February 1, 2010.

Goodwill
Goodwill arises from business combinations and represents the excess of the purchase price of an acquired entity over the fair value amounts assigned to assets acquired and liabilities assumed. The increase in goodwill was largely due to final purchase accounting adjustments related to the Bear Stearns merger, foreign currency translation adjustments related to the Firm's Canadian credit card operations, and IB's acquisition of a commodities business. For additional information on goodwill, see Note 17 on pages 222–225 of this Annual Report.

Mortgage servicing rights
MSRs represent the fair value of future cash flows for performing specified mortgage servicing activities (predominantly with respect to residential mortgages) for others. MSRs are either purchased from third parties or retained upon sale or securitization of mortgage loans. Servicing activities include collecting principal, interest, and escrow payments from borrowers; making tax and insurance payments on behalf of borrowers; monitoring delinquencies and executing foreclosure proceedings; and accounting for and remitting principal and interest payments to the investors of the mortgage-backed securities. MSRs increased due to increases in the fair value of the MSR asset, related primarily to market interest rate and other changes affecting the Firm's estimate of future prepayments, as well as sales in RFS of originated loans for which servicing rights were retained. These increases were offset partially by servicing portfolio run-off. For additional information on MSRs, see Note 17 on pages 222–225 of this Annual Report.

Other intangible assets
Other intangible assets consist of purchased credit card relationships, other credit card–related intangibles, core deposit intangibles and other intangibles. The decrease in other intangible assets primarily reflected amortization expense, partially offset by foreign currency translation adjustments related to the Firm's Canadian credit card operations. For additional information on other intangible assets, see Note 17 on pages 222–225 of this Annual Report.

Deposits
Deposits represent a liability to customers, both retail and wholesale, related to non-brokerage funds held on their behalf. Deposits are classified by location (U.S. and non-U.S.), whether they are interest- or noninterest-bearing, and by type (i.e., demand, money market, savings, time or negotiable order of withdrawal accounts). Deposits help provide a stable and consistent source of funding for the Firm. Wholesale deposits in TSS declined from the elevated levels at December 31, 2008, reflecting the continued normalization of deposit levels following the strong inflows resulting from the heightened volatility and credit concerns affecting the markets during the latter part of 2008. Organic growth in deposits in CB and RFS was offset partially by the maturity of high rate interest-bearing CDs that were acquired as part of the Washington Mutual transaction. For more information on deposits, refer to the RFS and AM segment discussions on pages 66–71 and 79–81, respectively; the Liquidity Risk Management discussion on pages 96–100; and Note 19 on page 226 of this Annual Report. For more information on wholesale liability balances, including deposits, refer to the CB and TSS segment discussions on pages 75–76 and 77–78, respectively, of this Annual Report.

Federal funds purchased and securities loaned or sold under repurchase agreements
The Firm uses these instruments as part of its liquidity management activities and to support the Firm's trading and risk management activities. In particular, the Firm uses federal funds purchased and securities loaned or sold under repurchase agreements as short-term funding sources and to make securities available to clients for their short-term liquidity purposes. The increase in securities sold under repurchase agreements was primarily attributable to favorable pricing and the financing of the increase in the AFS securities portfolio. For additional information on the Firm's Liquidity Risk Management, see pages 96–100 of this Annual Report.

Commercial paper and other borrowed funds
The Firm uses commercial paper and other borrowed funds as part of its liquidity management activities to meet short-term funding needs, and in connection with a TSS liquidity management product, whereby excess client funds are transferred into commercial paper overnight sweep accounts. The decrease in other borrowed funds was predominantly due to lower advances from Federal Home Loan Banks; the absence of borrowings from the Federal Reserve under the Term

Auction Facility program and a decline to zero in the balance related to the Federal Reserve Bank of Boston AML Facility, which was ended on February 1, 2010. For additional information on the Firm's Liquidity Risk Management and other borrowed funds, see pages 96–100, and Note 20 on page 227 of this Annual Report.

Accounts payable and other liabilities
Accounts payable and other liabilities consist of accounts payable to customers (primarily from activities related to IB's Prime Services business); payables to brokers, dealers and clearing organizations; payables from failed securities purchases; accrued expense, including interest-bearing liabilities; and all other liabilities, including obligations to return securities received as collateral. The decrease in accounts payable and other liabilities primarily reflected lower customer payables due predominantly to lower balances in the brokerage accounts of IB's Prime Services customers.

Beneficial interests issued by consolidated VIEs
JPMorgan Chase uses VIEs to assist clients in accessing the financial markets in a cost-efficient manner. A VIE is consolidated if the Firm will absorb a majority of a VIE's expected losses, receive a majority of a VIE's expected residual returns, or both. Included in the caption "beneficial interests issued by consolidated VIEs" are interest-bearing beneficial-interest liabilities issued by the consolidated VIEs, which increased as a result of the consolidation during the second quarter of 2009 of a multi-seller conduit and a credit card loan securitization trust (Washington Mutual Master Trust). For additional information on Firm-sponsored VIEs and loan securitization trusts, see Off–Balance Sheet Arrangements and Contractual Cash Obligations below, and Note 16 on pages 214–222 of this Annual Report.

Long-term debt
The Firm uses long-term debt (including trust preferred capital debt securities) to provide cost-effective and diversified sources of funds and as critical components of the Firm's liquidity and capital management activities. Long-term debt decreased slightly, predominantly due to net redemptions and maturities. The Firm also issued $11.0 billion and $2.6 billion of non-FDIC guaranteed debt in the U.S. and European markets, respectively, and $2.5 billion of trust preferred capital debt securities. For additional information on the Firm's long-term debt activities, see the Liquidity Risk Management discussion on pages 96–100 of this Annual Report.

Stockholders' equity
The decrease in total stockholders' equity was largely due to the redemption in the second quarter of 2009 of the $25.0 billion Series K Preferred Stock issued to the U.S. Treasury pursuant to TARP, and the declaration of cash dividends on preferred and common stock. The decrease was almost entirely offset by net income for 2009; the issuance of $5.8 billion of common equity in the public markets; a net increase in accumulated other comprehensive income, due primarily to net unrealized gains from overall market spread and market liquidity improvement, as well as changes in the composition of investments in the AFS securities portfolio; and net issuances under the Firm's employee stock-based compensation plans. For a further discussion, see the Capital Management section on pages 90–93, Note 23 on pages 230–231 and Note 26 on page 233 of this Annual Report.

OFF–BALANCE SHEET ARRANGEMENTS AND CONTRACTUAL CASH OBLIGATIONS

JPMorgan Chase is involved with several types of off–balance sheet arrangements, including special purpose entities ("SPEs") and lending-related financial instruments (e.g., commitments and guarantees).

Special-purpose entities

The basic SPE structure involves a company selling assets to the SPE. The SPE funds the purchase of those assets by issuing securities to investors in the form of commercial paper, short-term asset-backed notes, medium-term notes and other forms of interest. SPEs are generally structured to insulate investors from claims on the SPE's assets by creditors of other entities, including the creditors of the seller of the assets.

SPEs are an important part of the financial markets, providing market liquidity by facilitating investors' access to specific portfolios of assets and risks. These arrangements are integral to the markets for mortgage-backed securities, commercial paper and other asset-backed securities.

JPMorgan Chase uses SPEs as a source of liquidity for itself and its clients by securitizing financial assets, and by creating investment products for clients. The Firm is involved with SPEs through multi-seller conduits and investor intermediation activities, and as a result of its loan securitizations, through qualifying special purpose entities ("QSPEs"). This discussion focuses mostly on multi-seller conduits and investor intermediation. For a detailed discussion of all SPEs with which the Firm is involved, and the related accounting, see Note 1, Note 15 and Note 16 on pages 150–151, 206–213 and 214–222, respectively, of this Annual Report.

During the quarter ended June 30, 2009, the Firm took certain actions related to both the Chase Issuance Trust (the "Trust") and the Washington Mutual Master Trust (the "WMM Trust"). These actions and their impact on the Firm's Consolidated Balance Sheets and results of operations are further discussed in Note 15 on pages 206–213 of this Annual Report.

The Firm holds capital, as deemed appropriate, against all SPE-related transactions and related exposures, such as derivative transactions and lending-related commitments and guarantees.

The Firm modifies loans that it services, and that were sold to off-balance sheet SPEs, pursuant to the U.S. Treasury's Making Home Affordable ("MHA") programs and the Firm's other loss mitigation programs. For both the Firm's on–balance sheet loans and loans serviced for others, approximately 600,000 mortgage modifications had been offered to borrowers in 2009. Of these, 89,000 have

achieved permanent modification. Substantially all of the loans contractually modified to date were modified under the Firm's other loss mitigation programs. See Consumer Credit Portfolio on pages 114–123 of this Annual Report for more details on these loan modifications.

The Firm has no commitments to issue its own stock to support any SPE transaction, and its policies require that transactions with SPEs be conducted at arm's length and reflect market pricing. Consistent with this policy, no JPMorgan Chase employee is permitted to invest in SPEs with which the Firm is involved where such investment would violate the Firm's Code of Conduct. These rules prohibit employees from self-dealing and acting on behalf of the Firm in transactions with which they or their family have any significant financial interest.

Implications of a credit rating downgrade to JPMorgan Chase Bank, N.A.

For certain liquidity commitments to SPEs, the Firm could be required to provide funding if the short-term credit rating of JPMorgan Chase Bank, N.A., was downgraded below specific levels, primarily "P-1", "A-1" and "F1" for Moody's, Standard & Poor's and Fitch, respectively. The amount of these liquidity commitments was $34.2 billion and $61.0 billion at December 31, 2009 and 2008, respectively. Alternatively, if JPMorgan Chase Bank, N.A., were downgraded, the Firm could be replaced by another liquidity provider in lieu of providing funding under the liquidity commitment or, in certain circumstances, the Firm could facilitate the sale or refinancing of the assets in the SPE in order to provide liquidity. The Firm's liquidity commitments to SPEs are included in other unfunded commitments to extend credit and asset purchase agreements, as shown in the Off-balance sheet lending-related financial instruments and guarantees table on page 89 of this Annual Report.

As noted above, the Firm is involved with three types of SPEs: multi-seller conduits, investor intermediation, and its own loan securitization activities. A summary of each type of SPE follows.

Multi-seller conduits

The Firm helps customers meet their financing needs by providing access to the commercial paper markets through VIEs known as multi-seller conduits. Multi-seller conduit entities are separate bankruptcy-remote entities that purchase interests in, and make loans secured by, pools of receivables and other financial assets pursuant to agreements with customers of the Firm. The conduits fund their purchases and loans through the issuance of highly-rated commercial paper to third-party investors. The primary source of repayment of the commercial paper is the cash flow from the pools of assets. JPMorgan Chase receives fees related to the structuring of multi-seller conduit transactions and receives compensation from the multi-seller conduits for its role as administrative agent, liquidity provider, and provider of program-wide credit enhancement.

Investor intermediation

As a financial intermediary, the Firm creates certain types of VIEs and also structures transactions, typically derivative structures, with these VIEs to meet investor needs. The Firm may also provide liquidity and other support. The risks inherent in derivative instruments or liquidity commitments are managed similarly to other credit, market and liquidity risks to which the Firm is exposed. The principal types of VIEs the Firm uses in these structuring activities are municipal bond vehicles, credit-linked note vehicles, asset swap vehicles and collateralized debt obligation vehicles.

Loan securitizations

JPMorgan Chase securitizes and sells a variety of loans, including residential mortgages, credit cards, automobile, student, and commercial loans (primarily related to real estate). JPMorgan Chase-sponsored securitizations utilize SPEs as part of the securitization process. These SPEs were structured to meet the definition of a QSPE (as discussed in Note 1 on pages 150–151 of this Annual Report); accordingly, the assets and liabilities of securitization-related QSPEs were not reflected on the Firm's Consolidated Balance Sheets (except for retained interests, as described below) as of December 31, 2009. The primary purpose of these vehicles is to meet investor needs and generate liquidity for the Firm through the sale of loans to the QSPEs. These QSPEs are financed through the issuance of fixed- or floating-rate asset-backed securities that are sold to third-party investors or held by the Firm. For a discussion regarding the new consolidation guidance for VIEs including securitization entities, see "Accounting for transfers of financial assets and consolidation of variable interest entities" on page 141 of this Annual Report.

Special-purpose entities revenue

The following table summarizes certain revenue information related to consolidated and nonconsolidated VIEs and QSPEs with which the Firm has significant involvement. The revenue reported in the table below primarily represents contractual servicing and credit fee income (i.e., for income from acting as administrator, structurer, liquidity provider). It does not include mark-to-market gains and losses from changes in the fair value of trading positions (such as derivative transactions) entered into with VIEs. Those gains and losses are recorded in principal transactions revenue.

Revenue from VIEs and Securitization Entities[a]

Year ended December 31, (in millions)	**2009**	2008	2007
Multi-seller conduits	**$ 460**	$ 314	$ 187[c]
Investor intermediation	**34**	22	33
QSPEs and other securitization entities[b]	**2,510**	1,742	1,420
Total	**$ 3,004**	$ 2,078	$ 1,640

(a) Includes revenue associated with both consolidated VIEs and significant nonconsolidated VIEs.
(b) Excludes servicing revenue from loans sold to and securitized by third parties.
(c) Excludes the markdown on subprime CDO assets that was recorded in principal transactions revenue in 2007.

Off–balance sheet lending-related financial instruments and guarantees

JPMorgan Chase utilizes lending-related financial instruments (e.g., commitments and guarantees) to meet the financing needs of its customers. The contractual amount of these financial instruments represents the maximum possible credit risk should the counterparty draw upon the commitment or the Firm be required to fulfill its obligation under the guarantee, and the counterparty subsequently fail to perform according to the terms of the contract. These commitments and guarantees often expire without being drawn and even higher proportions expire without a default. As a result, the total contractual amount of these instruments is not, in the Firm's view, representative of its actual future credit exposure or funding requirements. For further discussion of lending-related commitments and guarantees and the Firm's accounting for them, see page 113 and Note 31 on pages 238–242 of this Annual Report.

The accompanying table on the next page presents, as of December 31, 2009, the contractual maturity amounts of off–balance sheet lending-related financial instruments and guarantees. The amounts in the table for credit card and home equity lending-related commitments represent the total available credit for these products. The Firm has not experienced, and does not anticipate, that all available lines of credit for these products would be utilized at the same time. The Firm can reduce or cancel these lines of credit by providing the borrower prior notice or, in some cases, without notice as permitted by law. The accompanying table excludes certain commitments and guarantees that do not have a contractual maturity date (e.g., loan sale and securitization-related indemnifications). For further discussion, see Note 31 on pages 238–242 of this Annual Report. Asset purchase agreements are agreements with the Firm's administered multi-seller, asset-backed commercial paper conduits, and other third-party entities. In 2009, the Firm consolidated a multi-seller conduit due to the redemption of the expected loss note. As a result, asset purchase agreements, in the following table, exclude $7.9 billion at December 31, 2009, related to this consolidated multi-seller conduit. The maturities, in the accompanying table, are based on the weighted-average life of the underlying assets in the SPE, which are based on the remainder of each conduit transaction's committed liquidity facility plus either the expected weighted average life of the assets should the committed liquidity facility expire without renewal, or the expected time to sell the underlying assets in the securitization market.

Contractual cash obligations

In the normal course of business, the Firm enters into various contractual obligations that may require future cash payments. Commitments for future cash expenditures primarily include contracts to purchase future services and capital expenditures related to real estate–related obligations and equipment.

The accompanying table on the next page summarizes, by remaining maturity, JPMorgan Chase's off–balance sheet lending-related financial instruments and significant contractual cash obligations at December 31, 2009. Contractual purchases and capital expenditures in the table below reflect the minimum contractual obligation under legally enforceable contracts with terms that are both fixed and determinable. Excluded from the following table are a number of obligations to be settled in cash, primarily in under one year. These obligations are reflected on the Firm's Consolidated Balance Sheets and include federal funds purchased and securities loaned or sold under repurchase agreements; commercial paper; other borrowed funds; purchases of debt and equity instruments; derivative payables; and certain purchases of instruments that resulted in settlement failures. Also excluded are contingent payments associated with certain acquisitions that could not be estimated. For discussion regarding long-term debt (including trust preferred capital debt securities), see Note 22 on pages 228–229 of this Annual Report. For discussion regarding operating leases, see Note 30 on page 238 of this Annual Report.

The following table presents maturity information for off-balance sheet lending-related financial instruments, guarantees and other commitments.

Off–balance sheet lending-related financial instruments, guarantees and other commitments

By remaining maturity at December 31, (in millions)	2009					2008

Equity investment commitments[h]	**1,477**	**2**	**—**	**895**	**2,374**	2,424
Contractual purchases and capital expenditures	**2,005**	**862**	**419**	**488**	**3,774**	2,687
Obligations under affinity and co-brand programs	**1,091**	**2,144**	**1,604**	**2,059**	**6,898**	8,138
Other liabilities[i]	**906**	**891**	**873**	**2,690**	**5,360**	5,005
Total	**$ 283,137**	**$ 122,570**	**$ 54,571**	**$ 110,342**	**$ 570,620**	$ 685,654

(a) Represents the contractual amount net of risk participations totaling $24.6 billion and $26.4 billion for standby letters of credit and other financial guarantees at December 31, 2009 and 2008, respectively, $690 million and $1.1 billion for other letters of credit at December 31, 2009 and 2008, respectively, and $643 million and $789 million for other unfunded commitments to extend credit at December 31, 2009 and 2008, respectively. In regulatory filings with the Federal Reserve Board these commitments are shown gross of risk participations.

(b) JPMorgan Chase held collateral relating to $31.5 billion and $31.0 billion of standby letters of credit, respectively, and $1.3 billion and $1.0 billion of other letters of credit at December 31, 2009 and 2008, respectively.

(c) Includes unissued standby letters-of-credit commitments of $38.4 billion and $39.5 billion at December 31, 2009 and 2008, respectively.

(d) Collateral held by the Firm in support of securities lending indemnification agreements was $173.2 billion and $170.1 billion at December 31, 2009 and 2008, respectively. Securities lending collateral comprises primarily cash, and securities issued by governments that are members of the Organisation for Economic Co-operation and Development ("OECD") and U.S. government agencies.

(e) Represents notional amounts of derivatives qualifying as guarantees. For further discussion of guarantees, see Note 5 on pages 175–183 and Note 31 on pages 238–242 of this Annual Report.

(f) Included on the Consolidated Balance Sheets in beneficial interests issued by consolidated variable interest entities.

(g) Includes noncancelable operating leases for premises and equipment used primarily for banking purposes and for energy-related tolling service agreements. Excludes the benefit of noncancelable sublease rentals of $1.8 billion and $2.3 billion at December 31, 2009 and 2008, respectively.

(h) Includes unfunded commitments to third-party private equity funds of $1.5 billion and $1.4 billion at December 31, 2009 and 2008, respectively. Also includes unfunded commitments for other equity investments of $897 million and $1.0 billion at December 31, 2009 and 2008, respectively. These commitments include $1.5 billion at December 31, 2009, related to investments that are generally fair valued at net asset value as discussed in Note 3 on pages 156–173 of this Annual Report.

(i) Includes deferred annuity contracts. Excluded contributions to the U.S. pension and other postretirement benefits plans, as these contributions are not reasonably estimable at this time. Also excluded are unrecognized tax benefits of $6.6 billion and $5.9 billion at December 31, 2009 and 2008, respectively, as the timing and amount of future cash payments are not determinable at this time.

CAPITAL MANAGEMENT

A strong capital position is essential to the Firm's business strategy and competitive position. The Firm's capital strategy focuses on long-term stability, which enables it to build and invest in market-leading businesses, even in a highly stressed environment. Senior management considers the implications on the Firm's capital strength prior to making any decision on future business activities. In addition to considering the Firm's earnings outlook, senior management evaluates all sources and uses of capital and makes decisions to vary any source or use to preserve the Firm's capital strength.

The Firm's capital management objectives are to hold capital sufficient to:

- Cover all material risks underlying the Firm's business activities;
- Maintain "well-capitalized" status under regulatory requirements;
- Achieve debt rating targets;
- Remain flexible to take advantage of future opportunities; and
- Build and invest in businesses, even in a highly stressed environment.

The quality and composition of capital are key factors in senior management's evaluation of the Firm's capital adequacy. The Firm strongly emphasizes the quality of its capital and, accordingly, holds a significant amount of its capital in the form of common equity. The Firm uses the following three capital disciplines:

- *Regulatory capital* – The capital required according to standards stipulated by U.S. bank regulatory agencies.
- *Economic risk capital* – A bottoms-up assessment of the underlying risks of the Firm's business activities, utilizing internal risk-assessment methodologies.
- *Line of business equity* – The amount the Firm believes each business segment would require if it were operating independently, which incorporates sufficient capital to address economic risk measures, regulatory capital requirements and capital levels for similarly rated peers.

Regulatory capital

The Federal Reserve establishes capital requirements, including well-capitalized standards for the consolidated financial holding company. The Office of the Comptroller of the Currency ("OCC") establishes similar capital requirements and standards for the Firm's national banks, including JPMorgan Chase Bank, N.A. and Chase Bank USA, N.A.

In connection with the U.S. Government's Supervisory Capital Assessment Program in 2009, U.S. banking regulators developed a new measure of capital, Tier 1 common capital, which is defined as Tier 1 capital less elements of Tier 1 capital not in the form of common equity – such as perpetual preferred stock, noncontrolling interests in subsidiaries and trust preferred capital debt securities. Tier 1 common capital, a non-GAAP financial measure, is used by banking regulators, investors and analysts to assess and compare the quality and composition of the Firm's capital with the capital of other financial services companies. The Firm uses Tier 1 common capital along with the other capital measures presented below to assess and monitor its capital position.

The Federal Reserve granted the Firm, for a period of 18 months following the Bear Stearns merger, relief up to a certain specified amount and subject to certain conditions from the Federal Reserve's risk-based capital and leverage requirements with respect to Bear Stearns' risk-weighted assets and other exposures acquired. The OCC granted JPMorgan Chase Bank, N.A. similar relief from its risk-based capital and leverage requirements. The relief would have ended, by its terms, on September 30, 2009. Commencing in the second quarter of 2009, the Firm no longer adjusted its risk-based capital ratios to take into account the relief in the calculation of its risk-based capital ratios as of June 30, 2009.

JPMorgan Chase maintained Tier 1 and Total capital ratios at December 31, 2009 and 2008, in excess of the well-capitalized standards established by the Federal Reserve, as indicated in the tables below. In addition, the Firm's Tier 1 common ratio was significantly above the 4% well-capitalized standard that was established at the time of the Supervisory Capital Assessment Program. For more information, see Note 29 on pages 236–237 of this Annual Report.

Risk-based capital ratios

December 31, (in millions)	**2009**	2008
Tier 1 capital[(a)]	**11.1%**	10.9%
Total capital	**14.8**	14.8
Tier 1 leverage	**6.9**	6.9
Tier 1 common	**8.8**	7.0

(a) On January 1, 2010, the Firm adopted new accounting standards which required the consolidation of the Firm's credit card securitization trusts, bank-administered asset-backed commercial paper conduits, and certain mortgage and other consumer securitization entities. Refer to Note 16 on pages 214–222 of this Annual Report for additional information about the impact to the Firm of the new guidance.

A reconciliation of Total stockholders' equity to Tier 1 common capital, Tier 1 capital and Total qualifying capital is presented in the table below:

Risk-based capital components and assets

December 31, (in millions)	2009	2008
Tier 1 capital		
Tier 1 common capital:		
Total stockholders' equity	**$ 165,365**	$ 166,884
Less: Preferred stock	**8,152**	31,939
Common stockholders' equity	**157,213**	134,945
Effect of certain items in accumulated other comprehensive income/(loss) excluded from Tier 1 common equity	**75**	5,084
Less: Goodwill[a]	**46,630**	46,417
Fair value DVA on derivative and structured note liabilities related to the Firm's credit quality	**912**	2,358
Investments in certain subsidiaries	**802**	679
Other intangible assets	**3,660**	3,667
Tier 1 common capital	**105,284**	86,908
Preferred stock	**8,152**	31,939
Qualifying hybrid securities and noncontrolling interests[b]	**19,535**	17,257
Total Tier 1 capital	**132,971**	136,104
Tier 2 capital		
Long-term debt and other instruments qualifying as Tier 2 capital	**28,977**	31,659
Qualifying allowance for credit losses	**15,296**	17,187
Adjustment for investments in certain subsidiaries and other	**(171)**	(230)
Total Tier 2 capital	**44,102**	48,616
Total qualifying capital	**$ 177,073**	$ 184,720
Risk-weighted assets[c]	**$ 1,198,006**	$ 1,244,659
Total adjusted average assets[d]	**$ 1,933,767**	$ 1,966,895

(a) Goodwill is net of any associated deferred tax liabilities.
(b) Primarily includes trust preferred capital debt securities of certain business trusts.
(c) Includes off–balance sheet risk-weighted assets at December 31, 2009 and 2008, of $367.4 billion and $357.5 billion, respectively. Risk-weighted assets are calculated in accordance with U.S. federal regulatory capital standards.
(d) Adjusted average assets, for purposes of calculating the leverage ratio, include total average assets adjusted for unrealized gains/(losses) on securities, less deductions for disallowed goodwill and other intangible assets, investments in certain subsidiaries, and the total adjusted carrying value of nonfinancial equity investments that are subject to deductions from Tier 1 capital.

The Firm's Tier 1 common capital was $105.3 billion at December 31, 2009, compared with $86.9 billion at December 31, 2008, an increase of $18.4 billion. The increase was due to net income (adjusted for DVA) of $13.2 billion, a $5.8 billion issuance of common stock in June 2009, and net issuances of common stock under the Firm's employee stock-based compensation plans of $2.7 billion. The increase was partially offset by $2.1 billion of dividends on preferred and common stock and the $1.1 billion one-time noncash adjustment to common stockholders' equity related to the redemption of the $25.0 billion Series K Preferred Stock issued to the U.S. Treasury under the Capital Purchase Program. On June 5, 2009, the Firm issued $5.8 billion, or 163 million shares, of common stock to satisfy a regulatory condition requiring the Firm to demonstrate it could access the equity capital markets in order to be eligible to redeem the Series K Preferred Stock issued to the U.S. Treasury. The proceeds from this issuance were used for general corporate purposes.

The Firm's Tier 1 capital was $133.0 billion at December 31, 2009, compared with $136.1 billion at December 31, 2008, a decrease of $3.1 billion. The decrease in Tier 1 capital reflects the redemption of the Series K Preferred Stock, partially offset by the increase in Tier 1 common capital and $2.3 billion net issuances of qualifying trust preferred capital debt securities.

Additional information regarding the Firm's regulatory capital ratios and the related federal regulatory capital requirements and the capital ratios of the Firm's significant banking subsidiaries at December 31, 2009 and 2008, are presented in Note 29 on pages 236–237 of this Annual Report.

Capital Purchase Program

Pursuant to the Capital Purchase Program, on October 28, 2008, the Firm issued to the U.S. Treasury, for total proceeds of $25.0 billion, (i) 2.5 million shares of Series K Preferred Stock, and (ii) a Warrant to purchase up to 88,401,697 shares of the Firm's common stock, at an exercise price of $42.42 per share, subject to certain antidilution and other adjustments. On June 17, 2009, the Firm redeemed all of the outstanding shares of Series K Preferred Stock, and repaid the full $25.0 billion principal amount together with accrued dividends. The U.S. Treasury exchanged the Warrant for 88,401,697 warrants, each of which is a warrant to purchase a share of the Firm's common stock at an exercise price of $42.42 per share and, on December 11, 2009, sold the warrants in a secondary public offering for $950 million. The Firm did not purchase any of the warrants sold by the U.S. Treasury.

Basel II

The minimum risk-based capital requirements adopted by the U.S. federal banking agencies follow the Capital Accord of the Basel Committee on Banking Supervision. In 2004, the Basel Committee published a revision to the Accord ("Basel II"). The goal of the new Basel II Framework is to provide more risk-sensitive regulatory capital calculations and promote enhanced risk management practices among large, internationally active banking organizations. U.S. banking regulators published a final Basel II rule in December 2007, which will require JPMorgan Chase to implement Basel II at the holding company level, as well as at certain of its key U.S. bank subsidiaries.

Prior to full implementation of the new Basel II Framework, JPMorgan Chase will be required to complete a qualification period of four consecutive quarters during which it will need to demonstrate that it meets the requirements of the new rule to the satisfaction of its primary U.S. banking regulators. The U.S. implementation timetable consists of the qualification period, starting no later than April 1, 2010, followed by a minimum transition period of three years. During the transition period, Basel II risk-based capital requirements cannot fall below certain floors based on current ("Basel I") regulations. JPMorgan Chase expects to be in compliance with all relevant Basel II rules within the established timelines. In addition, the Firm has adopted, and will continue to adopt, based on various established timelines, Basel II rules in certain non-U.S. jurisdictions, as required.

Broker-dealer regulatory capital

JPMorgan Chase's principal U.S. broker-dealer subsidiaries are J.P. Morgan Securities Inc. ("JPMorgan Securities") and J.P. Morgan Clearing Corp. JPMorgan Securities and J.P. Morgan Clearing Corp. are each subject to Rule 15c3-1 under the Securities Exchange Act of 1934 ("Net Capital Rule"). JPMorgan Securities and J.P. Morgan Clearing Corp. are also registered as futures commission merchants and subject to Rule 1.17 under the Commodity Futures Trading Commission ("CFTC"). J.P. Morgan Clearing Corp., a subsidiary of JPMorgan Securities, provides clearing and settlement services.

JPMorgan Securities and J.P. Morgan Clearing Corp. have elected to compute their minimum net capital requirements in accordance with the "Alternative Net Capital Requirements" of the Net Capital Rule. At December 31, 2009, JPMorgan Securities' net capital, as defined by the Net Capital Rule, of $7.4 billion exceeded the minimum requirement by $6.9 billion. J.P. Morgan Clearing Corp.'s net capital of $5.2 billion exceeded the minimum requirement by $3.6 billion.

In addition to its minimum net capital requirement, JPMorgan Securities is required to hold tentative net capital in excess of $1.0 billion and is also required to notify the Securities and Exchange Commission ("SEC") in the event that tentative net capital is less than $5.0 billion, in accordance with the market and credit risk standards of Appendix E of the Net Capital Rule. As of December 31, 2009, JPMorgan Securities had tentative net capital in excess of the minimum and notification requirements.

Economic risk capital

JPMorgan Chase assesses its capital adequacy relative to the risks underlying its business activities, using internal risk-assessment methodologies. The Firm measures economic capital primarily based on four risk factors: credit, market, operational and private equity risk. The growth in economic risk capital from 2008 was primarily driven by higher credit risk capital within the consumer businesses, due to the full year effect of the Washington Mutual transaction and revised performance data in light of the recent weak economic environment.

Economic risk capital	Yearly Average	
(in billions)	**2009**	2008
Credit risk	**$ 51.3**	$ 37.8
Market risk	**15.4**	10.5
Operational risk	**8.5**	6.3
Private equity risk	**4.7**	5.3
Economic risk capital	**79.9**	59.9
Goodwill	**48.3**	46.1
Other[a]	**17.7**	23.1
Total common stockholders' equity	**$ 145.9**	$ 129.1

(a) Reflects additional capital required, in the Firm's view, to meet its regulatory and debt rating objectives.

Credit risk capital

Credit risk capital is estimated separately for the wholesale businesses (IB, CB, TSS and AM) and consumer businesses (RFS and CS).

Credit risk capital for the overall wholesale credit portfolio is defined in terms of unexpected credit losses, both from defaults and declines in the portfolio value due to credit deterioration, measured over a one-year period at a confidence level consistent with an "AA" credit rating standard. Unexpected losses are losses in excess of those for which allowance for credit losses are maintained. The capital methodology is based on several principal drivers of credit risk: exposure at default (or loan-equivalent amount), default likelihood, credit spreads, loss severity and portfolio correlation.

Credit risk capital for the consumer portfolio is based on product and other relevant risk segmentation. Actual segment level default and severity experience are used to estimate unexpected losses for a one-year horizon at a confidence level consistent with an "AA" credit rating standard. Results for certain segments or portfolios are derived from available benchmarks and are not model-driven.

Market risk capital

The Firm calculates market risk capital guided by the principle that capital should reflect the risk of loss in the value of portfolios and financial instruments caused by adverse movements in market variables, such as interest and foreign exchange rates, credit spreads, securities prices and commodities prices, taking into account the liquidity of the financial instruments. Results from daily VaR, biweekly stress-test, issuer credit spread and default risk calculations as well as other factors are used to determine appropriate capital levels. Market risk capital is allocated to each business segment based on its risk contribution. See Market Risk Management on pages 126–132 of this Annual Report for more information about these market risk measures.

Operational risk capital

Capital is allocated to the lines of business for operational risk using a risk-based capital allocation methodology which estimates operational risk on a bottoms-up basis. The operational risk capital model is based on actual losses and potential scenario-based stress losses, with adjustments to the capital calculation to reflect changes in the quality of the control environment or the use of risk-transfer products. The Firm believes its model is consistent with the new Basel II Framework. See Operational Risk Management on page 133 of this Annual Report for more information about operational risk.

Private equity risk capital

Capital is allocated to privately- and publicly- held securities, third-party fund investments, and commitments in the private equity portfolio to cover the potential loss associated with a decline in equity markets and related asset devaluations. In addition to negative market fluctuations, potential losses in private equity investment portfolios can be magnified by liquidity risk. The capital allocation for the private equity portfolio is based on measurement of the loss experience suffered by the Firm and other market participants over a prolonged period of adverse equity market conditions.

Line of business equity

The Firm's framework for allocating capital is based on the following objectives:

- Integrate firmwide capital management activities with capital management activities within each of the lines of business

- Measure performance consistently across all lines of business
- Provide comparability with peer firms for each of the lines of business

Equity for a line of business represents the amount the Firm believes the business would require if it were operating independently, incorporating sufficient capital to address economic risk measures, regulatory capital requirements and capital levels for similarly rated peers. Capital is also allocated to each line of business for, among other things, goodwill and other intangibles associated with acquisitions effected by the line of business. Return on common equity is measured and internal targets for expected returns are established as a key measure of a business segment's performance.

Relative to 2008, line of business equity remained largely unchanged during 2009.

Line of business equity

December 31, (in billions)	**2009**	2008
Investment Bank	**$ 33.0**	$ 33.0
Retail Financial Services	**25.0**	25.0
Card Services	**15.0**	15.0
Commercial Banking	**8.0**	8.0
Treasury & Securities Services	**5.0**	4.5
Asset Management	**7.0**	7.0
Corporate/Private Equity	**64.2**	42.4
Total common stockholders' equity	**$ 157.2**	$ 134.9

Line of business equity	Yearly Average	
(in billions)	**2009**	2008
Investment Bank	**$ 33.0**	$ 26.1
Retail Financial Services	**25.0**	19.0
Card Services	**15.0**	14.3
Commercial Banking	**8.0**	7.3
Treasury & Securities Services	**5.0**	3.8
Asset Management	**7.0**	5.6
Corporate/Private Equity	**52.9**	53.0
Total common stockholders' equity	**$ 145.9**	$ 129.1

In 2010, the Firm will enhance its line of business equity framework to better align equity assigned to each line of business with the anticipated changes in the business, as well as changes in the competitive and regulatory landscape. The lines of business will be capitalized based on the Tier 1 common standard, rather than the Tier 1 Capital standard.

Capital actions

Dividends

On February 23, 2009, the Board of Directors reduced the Firm's quarterly common stock dividend from $0.38 to $0.05 per share, effective with the dividend paid on April 30, 2009, to shareholders of record on April 6, 2009. The action enabled the Firm to retain approximately $5 billion in common equity during 2009, and was taken to ensure the Firm had sufficient capital strength in the event the very weak economic conditions that existed at the beginning of the year further deteriorated.

For information regarding dividend restrictions, see Note 23 and Note 28 on pages 230–231 and 236, respectively, of this Annual Report.

The following table shows the common dividend payout ratio based on reported net income.

Common dividend payout ratio

Year ended December 31,	**2009**	2008	2007
Common dividend payout ratio	**9%**	114%	34%

Issuance

On June 5, 2009, the Firm issued $5.8 billion, or 163 million shares, of common stock at $35.25 per share. On September 30, 2008, the Firm issued $11.5 billion, or 284 million shares, of common stock at $40.50 per share. The proceeds from these issuances were used for general corporate purposes. For additional information regarding common stock, see Note 24 on pages 231–232 of this Annual Report.

Stock repurchases

In April 2007, the Board of Directors approved a stock repurchase program that authorizes the repurchase of up to $10.0 billion of the Firm's common shares. In connection with the U.S. Treasury's sale of the warrants it received as part of the Capital Purchase Program, the Board of Directors amended the Firm's securities repurchase program to authorize the repurchase of warrants for its stock. During the years ended December 31, 2009 and 2008, the Firm did not repurchase any shares of its common stock. As of December 31, 2009, $6.2 billion of authorized repurchase capacity remained under the repurchase program with respect to repurchases of common stock, and all the authorized repurchase capacity remained with respect to the warrants.

The authorization to repurchase common stock and warrants will be utilized at management's discretion, and the timing of purchases and the exact number of shares and warrants purchased is subject to various factors, including market conditions; legal considerations affecting the amount and timing of repurchase activity; the Firm's capital position (taking into account goodwill and intangibles); internal capital generation; and alternative potential investment opportunities. The repurchase program does not include specific price targets or timetables, may be executed through open market purchases or privately negotiated transactions, or utilizing Rule 10b5-1 programs; and may be suspended at any time. A Rule 10b5-1 repurchase plan allows the Firm to repurchase its equity during periods when it would not otherwise be repurchasing common stock – for example, during internal trading "black-out periods." All purchases under a Rule 10b5-1 plan must be made according to a predefined plan that is established when the Firm is not aware of material nonpublic information.

For additional information regarding repurchases of the Firm's equity securities, see Part II, Item 5, Market for registrant's common equity, related stockholder matters and issuer purchases of equity securities, on page 18 of JPMorgan Chase's 2009 Form 10-K.

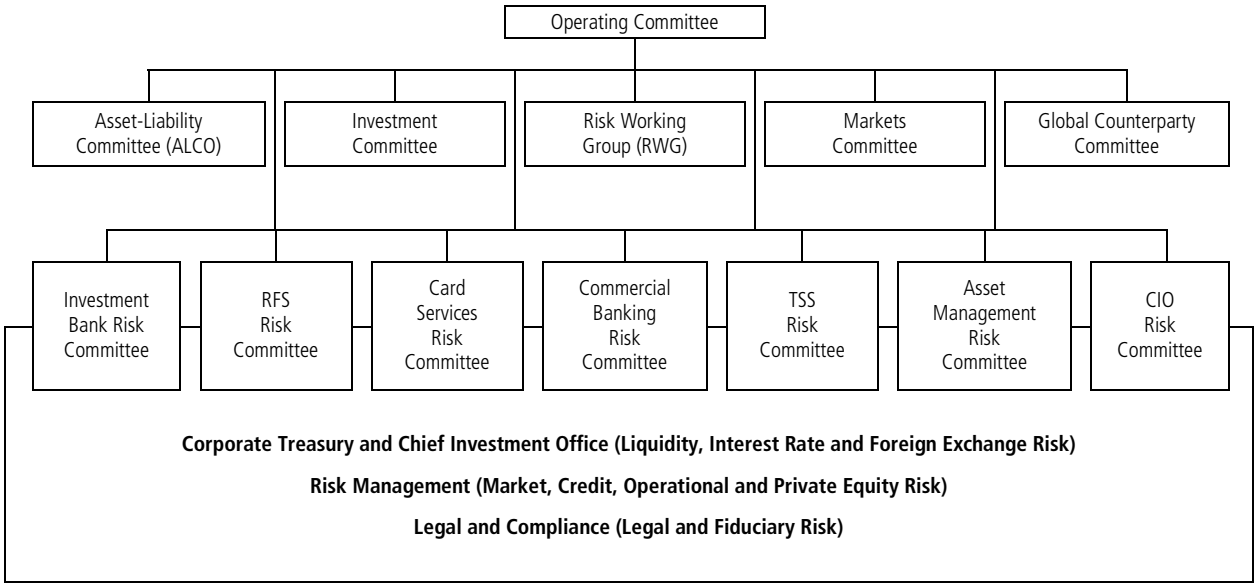
RISK MANAGEMENT

Risk is an inherent part of JPMorgan Chase's business activities and the Firm's overall risk tolerance is established in the context of the Firm's earnings power, capital, and diversified business model. The Firm's risk management framework and governance structure are intended to provide comprehensive controls and ongoing management of the major risks inherent in its business activities. It is also intended to create a culture of risk awareness and personal responsibility throughout the Firm. The Firm's ability to properly identify, measure, monitor and report risk is critical to both its soundness and profitability.

- Risk identification: The Firm's exposure to risk through its daily business dealings, including lending, trading and capital markets activities, is identified and aggregated through the Firm's risk management infrastructure. In addition, individuals who manage risk positions, particularly those that are complex, are responsible for identifying and estimating potential losses that could arise from specific or unusual events that may not be captured in other models, and those risks are communicated to senior management.
- Risk measurement: The Firm measures risk using a variety of methodologies, including calculating probable loss, unexpected loss and value-at-risk, and by conducting stress tests and making comparisons to external benchmarks. Measurement models and related assumptions are routinely reviewed with the goal of ensuring that the Firm's risk estimates are reasonable and reflect underlying positions.
- Risk monitoring/control: The Firm's risk management policies and procedures incorporate risk mitigation strategies and include approval limits by customer, product, industry, country and business. These limits are monitored on a daily, weekly and monthly basis, as appropriate.
- Risk reporting: Executed on both a line of business and a consolidated basis. This information is reported to management on a daily, weekly and monthly basis, as appropriate. There are eight major risk types identified in the business activities of the Firm: liquidity risk, credit risk, market risk, interest rate risk, private equity risk, operational risk, legal and fiduciary risk, and reputation risk.

Risk governance

The Firm's risk governance structure starts with each line of business being responsible for managing its own risks. Each line of business works closely with Risk Management through its own risk committee and its own chief risk officer to manage its risk. Each line of business risk committee is responsible for decisions regarding the business' risk strategy, policies and controls. The Firm's Chief Risk Officer is a member of the line of business risk committees.



Overlaying the line of business risk management are four corporate functions with risk management–related responsibilities, including the Chief Investment Office, Corporate Treasury, Legal and Compliance and Risk Management.

Risk Management is headed by the Firm's Chief Risk Officer, who is a member of the Firm's Operating Committee and who reports to the Chief Executive Officer and the Board of Directors, primarily through the Board's Risk Policy Committee. Risk Management is responsible for providing an independent firmwide function of risk management and controls. Within the Firm's Risk Management function are units responsible for credit risk, market risk, operational risk and private equity risk, as well as risk reporting, risk policy and risk technology and operations. Risk technology and operations is responsible for building the information technology infrastructure used to monitor and manage risk.

The Chief Investment Office and Corporate Treasury are responsible for measuring, monitoring, reporting and managing the Firm's liquidity, interest rate and foreign exchange risk.

Legal and Compliance has oversight for legal and fiduciary risk.

In addition to the risk committees of the lines of business and the above-referenced risk management functions, the Firm also has an Investment Committee, an Asset-Liability Committee and three other risk-related committees – the Risk Working Group, the Global Counterparty Committee and the Markets Committee. All of these committees are accountable to the Operating Committee which is involved in setting the Firm's overall risk appetite. The membership of these committees are composed of senior management of the Firm, including representatives of lines of business, Risk Management, Finance and other senior executives. The committees meet frequently to discuss a broad range of topics including, for example, current market conditions and other external events, risk exposures, and risk concentrations to ensure that the impact of risk factors are considered broadly across the Firm's businesses.

The Asset-Liability Committee monitors the Firm's overall interest rate risk and liquidity risk. ALCO is responsible for reviewing and approving the Firm's liquidity policy and contingency funding plan. ALCO also reviews the Firm's funds transfer pricing policy (through which lines of business "transfer" interest rate and foreign exchange risk to Corporate Treasury in the Corporate/Private Equity segment), earnings at risk, overall interest rate position, funding requirements and strategy, and the Firm's securitization programs (and any required liquidity support by the Firm of such programs).

The Investment Committee, chaired by the Firm's Chief Financial Officer, oversees global merger and acquisition activities undertaken by JPMorgan Chase for its own account that fall outside the scope of the Firm's private equity and other principal finance activities.

The Risk Working Group is chaired by the Firm's Chief Risk Officer and meets monthly to review issues that cross lines of business such as risk policy, risk methodology, Basel II and other regulatory issues, and such other topics referred to it by line-of-business risk committees or the Firm's Chief Risk Officer.

The Markets Committee, chaired by the Chief Risk Officer, meets weekly to review, monitor and discuss significant risk matters, which may include credit, market and operational risk issues; market moving events; large transactions; hedging strategies; reputation risk; conflicts of interest; and other issues.

The Global Counterparty Committee designates to the Chief Risk Officer of the Firm certain counterparties with which the Firm may trade at exposure levels above portfolio-established thresholds when deemed appropriate to support the Firm's trading activities. The Committee meets quarterly to review total exposures with these counterparties, with particular focus on counterparty trading exposures, and to direct changes in exposure levels as needed.

The Board of Directors exercises its oversight of risk management, principally through the Board's Risk Policy Committee and Audit Committee. The Risk Policy Committee oversees senior management risk-related responsibilities, including reviewing management policies and performance against these policies and related benchmarks. The Audit Committee is responsible for oversight of guidelines and policies that govern the process by which risk assessment and management is undertaken. In addition, the Audit Committee reviews with management the system of internal controls and financial reporting that is relied upon to provide reasonable assurance of compliance with the Firm's operational risk management processes.

LIQUIDITY RISK MANAGEMENT

The ability to maintain a sufficient level of liquidity is crucial to financial services companies, particularly their ability to maintain appropriate levels of liquidity during periods of adverse conditions. JPMorgan Chase's primary sources of liquidity include a diversified deposit base and access to the long-term debt (including trust preferred capital debt securities) and equity capital markets. The Firm's funding strategy is intended to ensure liquidity and diversity of funding sources to meet actual and contingent liabilities during both normal and stress periods. Consistent with this strategy, JPMorgan Chase maintains large pools of highly liquid unencumbered assets and significant sources of secured funding, and monitors its capacity in the wholesale funding markets across various geographic regions and in various currencies. The Firm also maintains access to secured funding capacity through overnight borrowings from various central banks. Throughout the recent financial crisis, the Firm successfully raised both secured and unsecured funding.

Governance

The Firm's governance process is designed to ensure that its liquidity position remains strong. The Asset-Liability Committee reviews and approves the Firm's liquidity policy and contingency funding plan. Corporate Treasury formulates and is responsible for executing the Firm's liquidity policy and contingency funding plan as well as measuring, monitoring, reporting and managing the Firm's liquidity risk profile. JPMorgan Chase uses a centralized approach for liquidity risk management to maximize liquidity access, minimize funding costs and permit identification and coordination of global liquidity risk. This approach involves frequent communication with the business segments, disciplined management of liquidity at the parent holding company, comprehensive market-based pricing of all assets and liabilities, continuous balance sheet management, frequent stress testing of liquidity sources, and frequent reporting to and communication with senior management and the Board of Directors regarding the Firm's liquidity position.

Liquidity monitoring

The Firm monitors liquidity trends, tracks historical and prospective on– and off–balance sheet liquidity obligations, identifies and measures internal and external liquidity warning signals to permit early detection of liquidity issues, and manages contingency planning (including identification and testing of various company-specific and market-driven stress scenarios). Various tools, which together contribute to an overall firmwide liquidity perspective, are used to monitor and manage liquidity. Among others, these include: (i) analysis of the timing of liquidity sources versus liquidity uses (i.e., funding gaps) over periods ranging from overnight to one year; (ii) management of debt and capital issuances to ensure that the illiquid portion of the balance sheet can be funded by equity, long-term debt (including trust preferred capital debt securities) and deposits the Firm believes to be stable; and (iii) assessment of the Firm's capacity to raise incremental unsecured and secured funding.

Liquidity of the parent holding company and its nonbank subsidiaries is monitored independently as well as in conjunction with the liquidity of the Firm's bank subsidiaries. At the parent holding company level, long-term funding is managed to ensure that the parent holding company has, at a minimum, sufficient liquidity to cover its obligations and those of its nonbank subsidiaries within the next 12 months. For bank subsidiaries, the focus of liquidity risk management is on maintenance of unsecured and secured funding capacity sufficient to meet on– and off–balance sheet obligations.

A component of liquidity management is the Firm's contingency funding plan. The goal of the plan is to ensure appropriate liquidity during normal and stress periods. The plan considers various temporary and long-term stress scenarios where access to wholesale unsecured funding is severely limited or nonexistent, taking into account both on– and off–balance sheet exposures, and separately evaluates access to funding sources by the parent holding company and the Firm's bank subsidiaries.

Recent events

The extraordinary levels of volatility exhibited in global markets during the second half of 2008 began to subside in 2009. Market participants were able to regain access to the debt, equity and consumer loan securitization markets as spreads tightened and liquidity returned to the markets.

The Firm believes its liquidity position is strong, based on its liquidity metrics as of December 31, 2009. The Firm believes that its unsecured and secured funding capacity is sufficient to meet its on– and off–balance sheet obligations. JPMorgan Chase's long-dated funding, including core liabilities, exceeded illiquid assets.

On March 30, 2009, the Federal Reserve announced that, effective April 27, 2009, it would reduce the amount it lent against certain loans pledged as collateral to the Federal Reserve Banks for discount window or payment-system risk purposes, in order to reflect recent trends in the values of those types of collateral. On October 19, 2009, the Federal Reserve further reduced the amount it lent against such collateral. These changes by the Federal Reserve did not have a material impact on the Firm's aggregate funding capacity.

The Firm participated in the FDIC's Temporary Liquidity Guarantee Program (the "TLG Program"), which was implemented in late 2008 as a temporary measure to help restore confidence in the financial system. This program is comprised of two components: the Debt Guarantee Program that provided an FDIC guarantee for certain senior unsecured debt issued through October 31, 2009, and the Transaction Account Guarantee Program (the "TAG Program") that provides unlimited insurance on certain noninterest-bearing transaction accounts. The expiration date of the TAG Program was extended by six months, from December 31, 2009, to June 30, 2010, to provide continued support to those institutions most affected by the recent financial crisis and to phase out

the program in an orderly manner. On October 22, 2009, the Firm notified the FDIC that, as of January 1, 2010, it would no longer participate in the TAG Program. As a result of the Firm's decision to opt out of the program, after December 31, 2009, funds held in noninterest-bearing transaction accounts will no longer be guaranteed in full, but will be insured up to $250,000 under the FDIC's general deposit rules. The insurance amount of $250,000 per depositor is in effect through December 31, 2013. On January 1, 2014, the insurance amount will return to $100,000 per depositor for all account categories except Individual Retirement Accounts ("IRAs") and certain other retirement accounts, which will remain at $250,000 per depositor.

Funding

Sources of funds

The deposits held by the RFS, CB, TSS and AM lines of business are generally stable sources of funding for JPMorgan Chase Bank, N.A. As of December 31, 2009, total deposits for the Firm were $938.4 billion, compared with $1.0 trillion at December 31, 2008. A significant portion of the Firm's deposits are retail deposits (38% at December 31, 2009), which are less sensitive to interest rate changes or market volatility and therefore are considered more stable than market-based (i.e., wholesale) liability balances. In addition, through the normal course of business, the Firm benefits from substantial liability balances originated by RFS, CB, TSS and AM. These franchise-generated liability balances include deposits, as well as deposits that are swept to on–balance sheet liabilities (e.g., commercial paper, federal funds purchased, and securities loaned or sold under repurchase agreements), a significant portion of which are considered to be stable and consistent sources of funding due to the nature of the businesses from which they are generated. For further discussions of deposit and liability balance trends, see the discussion of the results for the Firm's business segments and the Balance sheet analysis on pages 63–81 and 84–86, respectively, of this Annual Report.

Additional sources of funding include a variety of unsecured short- and long-term instruments, including federal funds purchased, certificates of deposit, time deposits, bank notes, commercial paper, long-term debt, trust preferred capital debt securities, preferred stock and common stock. Secured sources of funding include securities loaned or sold under repurchase agreements, asset-backed securitizations, and borrowings from the Chicago, Pittsburgh and San Francisco Federal Home Loan Banks. The Firm also borrows from the Federal Reserve (including discount-window borrowings, the Primary Dealer Credit Facility and the Term Auction Facility); however, the Firm does not view such borrowings from the Federal Reserve as a primary means of funding.

Issuance

Funding markets are evaluated on an ongoing basis to achieve an appropriate global balance of unsecured and secured funding at favorable rates. Generating funding from a broad range of sources in a variety of geographic locations enhances financial flexibility and limits dependence on any one source.

During 2009 and 2008, the Firm issued $19.7 billion and $20.8 billion, respectively, of FDIC-guaranteed long-term debt under the TLG Program, which became effective in October 2008. In 2009 the Firm also issued non-FDIC guaranteed debt of $16.1 billion, including $11.0 billion of senior notes and $2.5 billion of trust preferred capital debt securities, in the U.S. market, and $2.6 billion of senior notes in the European markets. In 2008 the Firm issued non-FDIC guaranteed debt of $23.6 billion, including $12.2 billion of senior notes and $1.8 billion of trust preferred capital debt securities in the U.S. market and $9.6 billion of senior notes in non-U.S. markets. Issuing non-FDIC guaranteed debt in the capital markets in 2009 was a prerequisite to redeeming the $25.0 billion of Series K Preferred Stock. In addition, during 2009 and 2008, JPMorgan Chase issued $15.5 billion and $28.0 billion, respectively, of IB structured notes that are included within long-term debt. During 2009 and 2008, $55.7 billion and $62.7 billion, respectively, of long-term debt (including trust preferred capital debt securities) matured or was redeemed, including $27.2 billion and $35.8 billion, respectively, of IB structured notes; the maturities or redemptions in 2009 offset the issuances during the period. During 2009 and 2008, the Firm also securitized $26.5 billion and $21.4 billion, respectively, of credit card loans.

Replacement capital covenants

In connection with the issuance of certain of its trust preferred capital debt securities and its noncumulative perpetual preferred stock, the Firm has entered into Replacement Capital Covenants ("RCCs"). These RCCs grant certain rights to the holders of "covered debt," as defined in the RCCs, that prohibit the repayment, redemption or purchase of such trust preferred capital debt securities and noncumulative perpetual preferred stock except, with limited exceptions, to the extent that JPMorgan Chase has received, in each such case, specified amounts of proceeds from the sale of certain qualifying securities. Currently, the Firm's covered debt is its 5.875% Junior Subordinated Deferrable Interest Debentures, Series O, due in 2035. For more information regarding these covenants, reference is made to the respective RCCs (including any supplements thereto) entered into by the Firm in relation to such trust preferred capital debt securities and noncumulative perpetual preferred stock, which are available in filings made by the Firm with the U.S. Securities and Exchange Commission.

Cash flows

For the years ended December 31, 2009, 2008 and 2007, cash and due from banks decreased $689 million, $13.2 billion and $268 million, respectively. The following discussion highlights the major activities and transactions that affected JPMorgan Chase's cash flows during 2009, 2008 and 2007.

Cash flows from operating activities

JPMorgan Chase's operating assets and liabilities support the Firm's capital markets and lending activities, including the origination or purchase of loans initially designated as held-for-sale. Operating assets and liabilities can vary significantly in the normal course of business due to the amount and timing of cash flows, which are affected by client-driven activities, market conditions

and trading strategies. Management believes cash flows from operations, available cash balances and the Firm's ability to generate cash through short- and long-term borrowings are sufficient to fund the Firm's operating liquidity needs.

For the years ended December 31, 2009 and 2008, net cash provided by operating activities was $121.9 billion and $23.1 billion, respectively, while for the year ended December 31, 2007, net cash used in operating activities was $110.6 billion. In 2009, the net decline in trading assets and liabilities was affected by balance sheet management activities and the impact of the challenging capital markets environment that existed at December 31, 2008, and continued into the first half of 2009. In 2009 and 2008, net cash generated from operating activities was higher than net income, largely as a result of adjustments for non-cash items such as the provision for credit losses. In addition, for 2009 and 2008 proceeds from sales, securitizations and paydowns of loans originated or purchased with an initial intent to sell were higher than cash used to acquire such loans, but the cash flows from these loan activities remained at reduced levels as a result of the lower activity in these markets since the second half of 2007.

For the year ended December 31, 2007, the net cash used in trading activities reflected a more active capital markets environment, largely from client-driven market-making activities. Also during 2007, cash used to originate or purchase loans held-for-sale was higher than proceeds from sales, securitizations and paydowns of such loans, although these activities were affected by a significant deterioration in liquidity in the second half of 2007.

Cash flows from investing activities

The Firm's investing activities predominantly include originating loans to be held for investment, the AFS securities portfolio and other short-term interest-earning assets. For the year ended December 31, 2009, net cash of $29.4 billion was provided by investing activities, primarily from: a decrease in deposits with banks reflecting lower demand for inter-bank lending and lower deposits with the Federal Reserve Bank relative to the elevated levels at the end of 2008; a net decrease in the loan portfolio across most businesses, driven by continued lower customer demand and loan sales in the wholesale businesses, lower charge volume on credit cards, slightly higher credit card securitizations, and paydowns; and the maturity of all asset-backed commercial paper issued by money market mutual funds in connection with the AML facility of the Federal Reserve Bank of Boston. Largely offsetting these cash proceeds were net purchases of AFS securities associated with the Firm's management of interest rate risk and investment of cash resulting from an excess funding position.

For the year ended December 31, 2008, net cash of $283.7 billion was used in investing activities, primarily for: increased deposits with banks as the result of the availability of excess cash for short-term investment opportunities through interbank lending, and reserve balances held by the Federal Reserve (which became an investing activity in 2008, reflecting a policy change of the Federal Reserve to pay interest to depository institutions on reserve balances); net purchases of investment securities in the AFS portfolio to manage the Firm's exposure to interest rate movements; net additions to the wholesale loan portfolio from organic growth in CB; additions to the consumer prime mortgage portfolio as a result of the decision to retain, rather than sell, new originations of nonconforming prime mortgage loans; an increase in securities purchased under resale agreements reflecting growth in demand from clients for liquidity; and net purchases of asset-backed commercial paper from money market mutual funds in connection with the AML facility of the Federal Reserve Bank of Boston. Partially offsetting these uses of cash were proceeds from loan sales and securitization activities as well as net cash received from acquisitions and the sale of an investment. Additionally, in June 2008, in connection with the Bear Stearns merger, the Firm sold assets acquired from Bear Stearns to the FRBNY and received cash proceeds of $28.85 billion.

For the year ended December 31,2007, net cash of $74.2 billion was used in investing activities, primarily for: funding purchases in the AFS securities portfolio to manage the Firm's exposure to interest rate movements; net additions to the wholesale retained loan portfolios in IB, CB and AM, mainly as a result of business growth; a net increase in the consumer retained loan portfolio, primarily reflecting growth in RFS in home equity loans and net additions to the RFS's subprime mortgage loans portfolio (which was affected by management's decision in the third quarter to retain (rather than sell) new subprime mortgages); growth in prime mortgage loans originated by RFS and AM that were not eligible to be sold to U.S. government agencies or U.S. government-sponsored enterprises; and increases in securities purchased under resale agreements as a result of a higher level of cash that was available for short-term investment opportunities in connection with the Firm's efforts to build liquidity. These net uses of cash were partially offset by cash proceeds received from sales and maturities of AFS securities and from credit card, residential mortgage, student and wholesale loan sales and securitization activities.

Cash flows from financing activities

The Firm's financing activities primarily reflect cash flows related to raising customer deposits, and issuing long-term debt (including trust preferred capital debt securities) as well as preferred and common stock. In 2009, net cash used in financing activities was $152.2 billion; this reflected a decline in wholesale deposits, predominantly in TSS, driven by the continued normalization of wholesale deposit levels resulting from the mitigation of credit concerns, compared with the heightened market volatility and credit concerns in the latter part of 2008; a decline in other borrowings, due to the absence of borrowings from the Federal Reserve under the Term Auction Facility program; net repayments of advances from Federal Home Loan Banks and the maturity of the nonrecourse advances under the Federal Reserve Bank of Boston AML Facility; the June 17, 2009, repayment in full of the $25.0 billion principal amount of Series K Preferred Stock issued to the U.S. Treasury; and the payment of cash dividends on common and preferred stock. Cash was also used for the net repayment of long-term debt and trust pre-

ferred capital debt securities, as issuances of FDIC-guaranteed debt and non-FDIC guaranteed debt in both the U.S. and European markets were more than offset by redemptions. Cash proceeds resulted from an increase in securities loaned or sold under repurchase agreements, partly attributable to favorable pricing and to financing the increased size of the Firm's AFS securities portfolio; and the issuance of $5.8 billion of common stock. There were no repurchases in the open market of common stock or the warrants during 2009.

In 2008, net cash provided by financing activities was $247.8 billion due to: growth in wholesale deposits, in particular, interest- and noninterest-bearing deposits in TSS (driven by both new and existing clients, and due to the deposit inflows related to the heightened volatility and credit concerns affecting the global markets that began in the third quarter of 2008), as well as increases in AM and CB (due to organic growth); proceeds of $25.0 billion from the issuance of preferred stock and the Warrant to the U.S. Treasury under the Capital Purchase Program; additional issuances of common stock and preferred stock used for general corporate purposes; an increase in other borrowings due to nonrecourse secured advances under the Federal Reserve Bank of Boston AML Facility to fund the purchase of asset-backed commercial paper from money market mutual funds; increases in federal funds purchased and securities loaned or sold under repurchase agreements in connection with higher client demand for liquidity and to finance growth in the Firm's AFS securities portfolio; and a net increase in long-term debt due to a combination of non-FDIC guaranteed debt and trust preferred capital debt securities issued prior to December 4, 2008, and the issuance of $20.8 billion of FDIC-guaranteed long-term debt issued during the fourth quarter of 2008. The fourth-quarter FDIC-guaranteed debt issuance was offset partially by maturities of non-FDIC guaranteed long-term debt during the same period. The increase in long-term debt (including trust preferred capital debt securities) was used primarily to fund certain illiquid assets held by the parent holding company and to build liquidity. Cash was also used to pay dividends on common and preferred stock. The Firm did not repurchase any shares of its common stock during 2008.

In 2007, net cash provided by financing activities was $184.1 billion due to a net increase in wholesale deposits from growth in business volumes, in particular, interest-bearing deposits at TSS, AM and CB; net issuances of long-term debt (including trust preferred capital debt securities) primarily to fund certain illiquid assets held by the parent holding company and build liquidity, and by IB from client-driven structured notes transactions; and growth in commercial paper issuances and other borrowed funds due to growth in the volume of liability balances in sweep accounts in TSS and CB, and to fund trading positions and to further build liquidity. Cash was used to repurchase common stock and pay dividends on common stock.

Credit ratings

The cost and availability of financing are influenced by credit ratings. Reductions in these ratings could have an adverse effect on the Firm's access to liquidity sources, increase the cost of funds, trigger additional collateral or funding requirements and decrease the number of investors and counterparties willing to lend to the Firm. Additionally, the Firm's funding requirements for VIEs and other third-party commitments may be adversely affected. For additional information on the impact of a credit ratings downgrade on the funding requirements for VIEs, and on derivatives and collateral agreements, see Special-purpose entities on pages 86–87 and Ratings profile of derivative receivables marked to market ("MTM"), and Note 5 on page 111 and pages 175–183, respectively, of this Annual Report.

Critical factors in maintaining high credit ratings include a stable and diverse earnings stream, strong capital ratios, strong credit quality and risk management controls, diverse funding sources, and disciplined liquidity monitoring procedures.

The credit ratings of the parent holding company and each of the Firm's significant banking subsidiaries as of January 15, 2010, were as follows.

	Short-term debt			Senior long-term debt		
	Moody's	S&P	Fitch	Moody's	S&P	Fitch
JPMorgan Chase & Co.	P-1	A-1	F1+	Aa3	A+	AA-
JPMorgan Chase Bank, N.A.	P-1	A-1+	F1+	Aa1	AA-	AA-
Chase Bank USA, N.A.	P-1	A-1+	F1+	Aa1	AA-	AA-

Ratings actions affecting the Firm

On March 4, 2009, Moody's revised the outlook on the Firm to negative from stable. This action was the result of Moody's view that the Firm's ability to generate capital would be adversely affected by higher credit costs due to the global recession. The rating action by Moody's in the first quarter of 2009 did not have a material impact on the cost or availability of the Firm's funding. At December 31, 2009, Moody's outlook remained negative.

Ratings from S&P and Fitch on JPMorgan Chase and its principal bank subsidiaries remained unchanged at December 31, 2009, from December 31, 2008. At December 31, 2009, S&P's outlook remained negative, while Fitch's outlook remained stable.

Following the Firm's earnings release on January 15, 2010, S&P and Moody's announced that their ratings on the Firm remained unchanged.

If the Firm's senior long-term debt ratings were downgraded by one additional notch, the Firm believes the incremental cost of funds or loss of funding would be manageable, within the context of current market conditions and the Firm's liquidity resources. JPMorgan Chase's unsecured debt does not contain requirements that would call for an acceleration of payments, maturities or changes in the structure of the existing debt, provide any limitations on future borrowings or require additional collateral, based on unfavorable

changes in the Firm's credit ratings, financial ratios, earnings, or stock price.

On February 24, 2009, S&P lowered the ratings on the trust preferred capital debt securities and other hybrid securities of 45 U.S. financial institutions, including those of JPMorgan Chase & Co. The Firm's ratings on trust preferred capital debt and noncumulative perpetual preferred securities were lowered from A- to BBB+. This action was the result of S&P's general view that there is an increased likelihood of issuers suspending interest and dividend payments in the current environment. This action by S&P did not have a material impact on the cost or availability of the Firm's funding.

On December 22, 2009, Moody's lowered the ratings on certain of the Firm's hybrid securities. The downgrades were consistent with Moody's revised guidelines for rating hybrid securities and subordinated debt. The ratings of junior subordinated debt securities with cumulative deferral features were lowered to A2 from A1, while those of cumulative preferred securities were downgraded to A3 from A2, and ratings for non-cumulative preferred securities were lowered to Baa1 from A2.

On January 29, 2010, Fitch downgraded 592 hybrid capital instruments issued by banks and other non-bank financial institutions, including those issued by the Firm. This action was in line with Fitch's revised hybrid ratings methodology. The Firm's trust preferred debt and hybrid preferred securities were downgraded by one notch to A.

Ratings actions affecting Firm-sponsored securitization trusts
In 2009, in light of increasing levels of losses in the Firm-sponsored securitization trusts due to the then worsening economic environment, S&P, Moody's and Fitch took various ratings actions with respect to the securities issued by the Firm's credit card securitization trusts, including the Chase Issuance Trust, Chase Credit Card Master Trust, Washington Mutual Master Note Trust and SCORE Credit Card Trust, including placing the ratings of certain securities of such Trusts on negative credit watch or review for possible downgrade, and, in a few circumstances, downgrading the ratings of some of the securities.

On May 12, 2009, the Firm took certain actions to increase the credit enhancement underlying the credit card asset-backed securities of the Chase Issuance Trust. As a result of these actions, the ratings of all asset-backed credit card securities of the Chase Issuance Trust were affirmed by the credit rating agencies, except for a negative rating outlook by Fitch which remains, as of December 31, 2009, on the subordinated securities of the Chase Issuance Trust.

On May 19, 2009, the Firm removed from the Washington Mutual Master Note Trust all remaining credit card receivables that had been originated by Washington Mutual. As a result of this action, the ratings of all asset-backed credit card securities of the Washington Mutual Master Note Trust were raised or affirmed by the credit rating agencies, with the exception that the senior securities of the Washington Mutual Master Note Trust were downgraded by S&P on December 23, 2009. S&P's action was the result of their consideration of a linkage between the ratings of the securities of Washington Mutual Master Note Trust and the Firm's own ratings as a result of the consolidation onto the Firm's Consolidated Balance Sheet of the assets and liabilities of the Washington Mutual Master Note Trust following the Firm's actions on May 19, 2009 (please refer to page 208 under Note 15 of this Annual Report).

The Firm did not take any actions to increase the credit enhancement underlying securitizations issued by the Chase Credit Card Master Trust and the SCORE Credit Card Trust during 2009. Certain mezzanine securities and subordinated securities of the Chase Credit Card Master Trust were downgraded by S&P and Moody's on August 6, 2009, and July 10, 2009, respectively. The senior and subordinated securities of the SCORE Credit Card Trust were placed on review for possible downgrade by Moody's on January 20, 2010.

The Firm believes the ratings actions described above did not have a material impact on the Firm's liquidity and ability to access the asset-backed securitization market.

With the exception of the Washington Mutual Master Note Trust as described above, the ratings on the Firm's asset-backed securities programs are currently independent of the Firm's own ratings. However, no assurance can be given that the credit rating agencies will not in the future consider there being a linkage between the ratings of the Firm's asset-backed securities programs and the Firm's own ratings as a result of accounting guidance for QSPEs and VIEs that became effective January 1, 2010. For a further discussion of the new FASB guidance, see "Accounting and reporting developments" and Note 16 on pages 140–142 and 214–222, respectively, of this Annual Report.

CREDIT RISK MANAGEMENT

Credit risk is the risk of loss from obligor or counterparty default. The Firm provides credit (for example, through loans, lending-related commitments, guarantees and derivatives) to a variety of customers, from large corporate and institutional clients to the individual consumer. For the wholesale business, credit risk management includes the distribution of the Firm's syndicated loan originations into the marketplace with exposure held in the retained portfolio averaging less than 10%. Wholesale loans generated by CB and AM are generally retained on the balance sheet. With regard to the consumer credit market, the Firm focuses on creating a portfolio that is diversified from both a product and a geographic perspective. Loss mitigation strategies are being employed for all home lending portfolios. These strategies include rate reductions, forbearance and other actions intended to minimize economic loss and avoid foreclosure. In the mortgage business, originated loans are either retained in the mortgage portfolio or securitized and sold to U.S. government agencies and U.S. government-sponsored enterprises.

Credit risk organization

Credit risk management is overseen by the Chief Risk Officer and implemented within the lines of business. The Firm's credit risk management governance consists of the following functions:

- establishing a comprehensive credit risk policy framework
- monitoring and managing credit risk across all portfolio segments, including transaction and line approval
- assigning and managing credit authorities in connection with the approval of all credit exposure
- managing criticized exposures and delinquent loans
- calculating the allowance for credit losses and ensuring appropriate credit risk-based capital management

Risk identification

The Firm is exposed to credit risk through lending and capital markets activities. Credit risk management works in partnership with the business segments in identifying and aggregating exposures across all lines of business.

Risk measurement

To measure credit risk, the Firm employs several methodologies for estimating the likelihood of obligor or counterparty default. Methodologies for measuring credit risk vary depending on several factors, including type of asset (e.g., consumer installment versus wholesale loan), risk measurement parameters (e.g., delinquency status and credit bureau score versus wholesale risk-rating) and risk management and collection processes (e.g., retail collection center versus centrally managed workout groups). Credit risk measurement is based on the amount of exposure should the obligor or the counterparty default, the probability of default and the loss severity given a default event. Based on these factors and related market-based inputs, the Firm estimates both probable and unexpected losses for the wholesale and consumer portfolios. Probable losses, reflected in the provision for credit losses, are based primarily upon statistical estimates of credit losses as a result of obligor or counterparty default. However, probable losses are not the sole indicators of risk. If losses were entirely predictable, the probable loss rate could be factored into pricing and covered as a normal and recurring cost of doing business. Unexpected losses, reflected in the allocation of credit risk capital, represent the potential volatility of actual losses relative to the probable level of losses. Risk measurement for the wholesale portfolio is assessed primarily on a risk-rated basis; for the consumer portfolio, it is assessed primarily on a credit-scored basis.

Risk-rated exposure

For portfolios that are risk-rated (generally held in IB, CB, TSS and AM), probable and unexpected loss calculations are based on estimates of probability of default and loss given default. Probability of default is the expected default calculated on an obligor basis. Loss given default is an estimate of losses given a default event and takes into consideration collateral and structural support for each credit facility. Calculations and assumptions are based on management information systems and methodologies which are under continual review. Risk ratings are assigned to differentiate risk within the portfolio and are reviewed on an ongoing basis by Credit Risk Management and revised, if needed, to reflect the borrowers' current financial position, risk profiles and the related collateral and structural positions.

Credit-scored exposure

For credit-scored portfolios (generally held in RFS and CS), probable loss is based on a statistical analysis of inherent losses over discrete periods of time. Probable losses are estimated using sophisticated portfolio modeling, credit scoring and decision-support tools to project credit risks and establish underwriting standards. In addition, common measures of credit quality derived from historical loss experience are used to predict consumer losses. Other risk characteristics evaluated include recent loss experience in the portfolios, changes in origination sources, portfolio seasoning, loss severity and underlying credit practices, including charge-off policies. These analyses are applied to the Firm's current portfolios in order to estimate delinquencies and severity of losses, which determine the amount of probable losses. These factors and analyses are updated at least on a quarterly basis or more frequently as market conditions dictate.

Risk monitoring

The Firm has developed policies and practices that are designed to preserve the independence and integrity of the approval and decision-making process of extending credit, and to ensure credit risks are assessed accurately, approved properly, monitored regularly and managed actively at both the transaction and portfolio levels. The policy framework establishes credit approval authorities, concentration limits, risk-rating methodologies, portfolio review parameters and guidelines for management of distressed exposure. Wholesale credit risk is monitored regularly on both an aggregate portfolio level and on an individual customer basis. Management of the Firm's wholesale exposure is accomplished through a number

of means including loan syndication and participations, loan sales, securitizations, credit derivatives, use of master netting agreements and collateral and other risk-reduction techniques, which are further discussed in the following risk sections. For consumer credit risk, the key focus items are trends and concentrations at the portfolio level, where potential problems can be remedied through changes in underwriting policies and portfolio guidelines. Consumer Credit Risk Management monitors trends against business expectations and industry benchmarks.

Risk reporting

To enable monitoring of credit risk and decision-making, aggregate credit exposure, credit quality forecasts, concentrations levels and risk profile changes are reported regularly to senior credit risk management. Detailed portfolio reporting of industry, customer, product and geographic concentrations occurs monthly, and the appropriateness of the allowance for credit losses is reviewed by senior management at least on a quarterly basis. Through the risk reporting and governance structure, credit risk trends and limit exceptions are provided regularly to, and discussed with, senior management, as mentioned on page 94 of this Annual Report.

2009 Credit risk overview

During 2009, the credit environment experienced further deterioration compared with 2008, resulting in increased defaults, downgrades and reduced liquidity. In the first part of the year, the pace of deterioration increased, adversely affecting many financial institutions and impacting the functioning of credit markets, which remained weak. The pace of deterioration also gave rise to a high level of uncertainty regarding the ultimate extent of the downturn. The Firm's credit portfolio was affected by these market conditions and experienced continued deteriorating credit quality, especially in the first part of the year, generally consistent with the market.

For the wholesale portfolio, criticized assets, nonperforming assets and charge-offs increased significantly from 2008, reflecting continued weakness in the portfolio, particularly in commercial real estate. In the latter part of the year, there were some positive indicators, for example, loan origination activity and market liquidity improved and credit spreads tightened. The wholesale businesses have remained focused on actively managing the portfolio, including ongoing, in-depth reviews of credit quality and industry, product and client concentrations. Underwriting standards across all areas of lending have remained under review and strengthened where appropriate, consistent with evolving market conditions and the Firm's risk management activities. In light of the current market conditions, the wholesale allowance for loan loss coverage ratio has been strengthened to 3.57% from 2.64% at the end of 2008.

The consumer portfolio credit performance continued to be negatively affected by the economic environment of 2009. Higher unemployment and weaker overall economic conditions have led to a significant increase in the number of loans charged off, while continued weak housing prices have driven a significant increase in the severity of loss recognized on real estate loans that defaulted. During 2009, the Firm took proactive action to assist homeowners most in need of financial assistance, including participation in the U.S. Treasury Making Home Affordable ("MHA") programs, which are designed to assist eligible homeowners in a number of ways, one of which is by modifying the terms of their mortgages. The MHA programs and the Firm's other loss-mitigation programs for financially troubled borrowers generally represent various concessions, such as term extensions, rate reductions and deferral of principal payments that would have been required under the terms of the original agreement. The Firm's loss-mitigation programs are intended to minimize economic loss to the Firm, while providing alternatives to foreclosure.

More detailed discussion of the domestic consumer credit environment can be found in Consumer Credit Portfolio on pages 114–123 of this Annual Report.

CREDIT PORTFOLIO

The following table presents JPMorgan Chase's credit portfolio as of December 31, 2009 and 2008. Total credit exposure at December 31, 2009, decreased by $322.6 billion from December 31, 2008, reflecting decreases of $170.5 billion in the wholesale portfolio and $152.1 billion in the consumer portfolio. During 2009, lending-related commitments decreased by $130.3 billion, managed loans decreased by $112.4 billion and derivative receivables decreased by $82.4 billion.

While overall portfolio exposure declined, the Firm provided more than $600 billion in new loans and lines of credit to consumer and wholesale clients in 2009, including individuals, small businesses, large corporations, not-for-profit organizations, U.S. states and municipalities, and other financial institutions.

In the table below, reported loans include loans retained; loans held-for-sale (which are carried at the lower of cost or fair value, with changes in value recorded in noninterest revenue); and loans accounted for at fair value. Loans retained are presented net of unearned income, unamortized discounts and premiums, and net deferred loan costs; for additional information, see Note 13 on pages 200–204 of this Annual Report. Nonperforming assets include nonaccrual loans and assets acquired in satisfaction of debt (primarily real estate owned). Nonaccrual loans are those for which the accrual of interest has been suspended in accordance with the Firm's accounting policies, which are described in Note 13 on pages 200–204 of this Annual Report. Average retained loan balances are used for the net charge-off rate calculations.

(a) Represents securitized credit card receivables. For further discussion of credit card securitizations, see Note 15 on pages 206–213 of this Annual Report.

(b) Represents the net notional amount of protection purchased and sold of single-name and portfolio credit derivatives used to manage both performing and nonperforming credit exposures; these derivatives do not qualify for hedge accounting under U.S. GAAP. For additional information, see Credit derivatives on pages 111–112 and Note 5 on pages 175–183 of this Annual Report.

(c) At December 31, 2009 and 2008, nonperforming loans and assets excluded: (1) mortgage loans insured by U.S. government agencies of $9.0 billion and $3.0 billion, respectively; (2) real estate owned insured by U.S. government agencies of $579 million and $364 million, respectively; and (3) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program of $542 million and $437 million, respectively. These amounts are excluded, as reimbursement is proceeding normally. In addition, the Firm's policy is generally to exempt credit card loans from being placed on nonaccrual status as permitted by regulatory guidance. Under guidance issued by the Federal Financial Institutions Examination Council, credit card loans are charged off by the end of the month in which the account becomes 180 days past due or within 60 days from receiving notification about a specified event (e.g., bankruptcy of the borrower), whichever is earlier.

(d) Excludes purchased credit-impaired loans that were acquired as part of the Washington Mutual transaction, which are accounted for on a pool basis. Since each pool is accounted for as a single asset with a single composite interest rate and an aggregate expectation of cash flows, the past due status of the pools, or that of individual loans within the pools, is not meaningful. Because the Firm is recognizing interest income on each pool of loans, they are all considered to be performing.

(e) Net charge-off ratios were calculated using: (1) average retained loans of $672.3 billion and $567.0 billion for the years ended December 31, 2009 and 2008, respectively; (2) average securitized loans of $85.4 billion and $79.6 billion for the years ended December 31, 2009 and 2008, respectively; and (3) average managed loans of $757.7 billion and $646.6 billion for the years ended December 31, 2009 and 2008, respectively.

(f) Firmwide net charge-off ratios were calculated including average purchased credit-impaired loans of $85.4 billion and $22.3 billion at December 31, 2009 and 2008, respectively. Excluding the impact of purchased credit-impaired loans, the total Firm's managed net charge-off rate would have been 4.37% and 2.15% respectively.

WHOLESALE CREDIT PORTFOLIO

As of December 31, 2009, wholesale exposure (IB, CB, TSS and AM) decreased by $170.5 billion from December 31, 2008. The $170.5 billion decrease was primarily driven by decreases of $82.4 billion of derivative receivables, $57.9 billion of loans and $32.7 billion of lending-related commitments. The decrease in derivative receivables was primarily related to tightening credit spreads, volatile foreign exchange rates and rising rates on interest rate swaps. Loans and lending-related commitments decreased across most wholesale lines of business, as lower customer demand continued to affect the level of lending activity.

Wholesale

As of or for the year ended December 31,	Credit exposure		Nonperforming loans[b]		90 days past due and still accruing

(a) Represents the net notional amount of protection purchased and sold of single-name and portfolio credit derivatives used to manage both performing and nonperforming credit exposures; these derivatives do not qualify for hedge accounting under U.S. GAAP. For additional information, see Credit derivatives on pages 111–112, and Note 5 on pages 175–183 of this Annual Report.

(b) Excludes assets acquired in loan satisfactions. For additional information, see the wholesale nonperforming assets by line of business segment table on pages 108–109 of this Annual Report.

The following table presents summaries of the maturity and ratings profiles of the wholesale portfolio as of December 31, 2009 and 2008. The ratings scale is based on the Firm's internal risk ratings, which generally correspond to the ratings as defined by S&P and Moody's.

Wholesale credit exposure – maturity and ratings profile

	Maturity profile[c]				Ratings profile			
December 31, 2009 (in billions, except ratios)	Due in 1 year or less	Due after 1 year through 5 years	Due after 5 years	Total	Investment-grade ("IG") AAA/Aaa to BBB-/Baa3	Noninvestment-grade BB+/Ba1 & below	Total	Total % of IG

	Maturity profile[c]				Ratings profile			
December 31, 2008 (in billions, except ratios)	Due in 1 year or less	Due after 1 year through 5 years	Due after 5 years	Total	Investment-grade ("IG") AAA/Aaa to BBB-/Baa3	Noninvestment-grade BB+/Ba1 & below	Total	Total % of IG
Loans	32%	43%	25%	100%	$ 161	$ 87	$ 248	65%
Derivative receivables	31	36	33	100	127	36	163	78
Lending-related commitments	37	59	4	100	317	63	380	83
Total excluding loans held-for-sale and loans at fair value	34%	50%	16%	100%	$ 605	$ 186	791	77%
Loans held-for-sale and loans at fair value[a]							14	
Receivables from customers							16	
Total exposure							$ 821	
Net credit derivative hedges notional[b]	47%	47%	6%	100%	$ (82)	$ (9)	$ (91)	90%

(a) Loans held-for-sale and loans at fair value relate primarily to syndicated loans and loans transferred from the retained portfolio.
(b) Represents the net notional amounts of protection purchased and sold of single-name and portfolio credit derivatives used to manage the credit exposures; these derivatives do not qualify for hedge accounting under U.S. GAAP.
(c) The maturity profile of loans and lending-related commitments is based on the remaining contractual maturity. The maturity profile of derivative receivables is based on the maturity profile of average exposure. See Derivative contracts on pages 110–112 of this Annual Report for further discussion of average exposure.

Wholesale credit exposure – selected industry exposures

The Firm focuses on the management and diversification of its industry exposures, with particular attention paid to industries with actual or potential credit concerns. Customer receivables representing primarily margin loans to prime and retail brokerage clients of $15.7 billion are included in the table. These margin loans are generally fully collateralized by cash or highly liquid securities to satisfy daily minimum collateral requirements. Exposures deemed criticized generally represent a ratings profile similar to a rating of "CCC+"/"Caa1" and lower, as defined by S&P and Moody's. The total criticized component of the portfolio, excluding loans held-for-sale and loans at fair value, increased to $33.2 billion at December 31, 2009, from $26.0 billion at year-end 2008. The increase was primarily related to downgrades within the portfolio.

During the fourth quarter of 2009, the Firm revised certain industry classifications to better reflect risk correlations and enhance the Firm's management of industry risk. Below are summaries of the top 25 industry exposures as of December 31, 2009 and 2008. For additional information on industry concentrations, see Note 32 on pages 242–243 of this Annual Report.

(a) Rankings are based on exposure at December 31, 2009. The rankings of the industries presented in the 2008 table are based on the rankings of such industries at year-end 2009, not actual rankings in 2008.
(b) For more information on exposures to SPEs included in all other, see Note 16 on pages 214–222 of this Annual Report.
(c) Represents undivided interests in pools of receivables and similar types of assets due to the consolidation during 2009 of one of the Firm-administered multi-seller conduits.
(d) Credit exposure is net of risk participations and excludes the benefit of credit derivative hedges and collateral held against derivative receivables or loans.
(e) Represents the net notional amounts of protection purchased and sold of single-name and portfolio credit derivatives used to manage the credit exposures; these derivatives do not qualify for hedge accounting.
(f) Represents other liquid securities collateral held by the Firm as of December 31, 2009 and 2008, respectively.

Presented below is a discussion of several industries to which the Firm has significant exposure, as well as industries the Firm continues to monitor because of actual or potential credit concerns. For additional information, refer to the tables above and on the preceding page.

- Real estate: Exposure to this industry decreased by 15% or $11.8 billion from 2008 as loans and commitments were managed down, predominantly through repayments and loans sales. This sector continues to be challenging as property values in the U.S. remain under pressure, particularly in certain regions. The ratios of nonperforming loans and net charge-offs to loans have increased from 2008 due to deterioration in the commercial real estate portfolio, particularly in the latter half of 2009. The multi-family portfolio, which represents almost half of the commercial real estate exposure, accounts for the smallest proportion of nonperforming loans and net charge-offs. The commercial lessors portfolio involves real estate leased to retail, industrial and office space tenants, while the commercial construction and development portfolio includes financing for the construction of office and professional buildings and malls. Commercial real estate exposure in CB is predominantly secured; CB's exposure represents the majority of the Firm's commercial real estate exposure. IB manages less than one fifth of the total Firm's commercial real estate exposure; IB's exposure represents primarily unsecured lending to Real Estate Investment Trust ("REITs"), lodging, and homebuilding clients. The increase in criticized real estate exposure was largely a result of downgrades within the overall portfolio reflecting the continued weakening credit environment.

The following table presents additional information on the wholesale real estate industry for the periods ended December 31, 2009 and 2008.

December 31, 2009 (in millions, except ratios)	Credit exposure	% of credit portfolio	Criticized exposure	Nonperforming loans	% of nonperforming loans to total loans[b]	Net charge-offs/ (recoveries)	% of net charge-offs to total loans[b]
Commercial real estate subcategories							
Multi-family	**$ 32,073**	**47%**	**$ 3,986**	**$ 1,109**	**3.57%**	**$ 199**	**0.64%**
Commercial lessors	**18,512**	**27**	**4,017**	**1,057**	**6.97**	**232**	**1.53**
Commercial construction and development	**6,593**	**10**	**1,518**	**313**	**6.81**	**105**	**2.28**
Other[a]	**11,331**	**16**	**2,454**	**409**	**6.44**	**152**	**2.39**
Total commercial real estate	**$ 68,509**	**100%**	**$ 11,975**	**$ 2,888**	**5.05%**	**$ 688**	**1.20%**

December 31, 2008 (in millions, except ratios)	Credit exposure	% of credit portfolio	Criticized exposure	Nonperforming loans	% of nonperforming loans to total loans[b]	Net charge-offs/ (recoveries)	% of net charge-offs to total loans[b]
Commercial real estate subcategories							
Multi-family	$ 36,188	45%	$ 1,191	$ 293	0.87%	$ (1)	—%
Commercial lessors	21,037	26	1,649	74	0.43	4	0.02
Commercial construction and development	6,688	8	706	82	1.95	4	0.10
Other[a]	16,371	21	2,415	357	3.89	205	2.23
Total commercial real estate	$ 80,284	100%	$ 5,961	$ 806	1.25%	$ 212	0.33%

(a) Other includes lodging, REITs, single family, homebuilders and other real estate.
(b) Ratios were calculated using end-of-period retained loans of $57.2 billion and $64.5 billion for the years ended December 31, 2009 and 2008, respectively.

- Banks and finance companies: Exposure to this industry decreased by 28% or $21.5 billion from 2008, primarily as a result of lower derivative exposure to commercial banks.
- Automotive: Conditions in the U.S. had improved by the end of 2009, largely as a result of the government supported restructuring of General Motors and Chrysler in the first half of 2009 and the related effects on automotive suppliers. Exposure to this industry decreased by 18% or $2.1 billion and criticized exposure decreased 30% or $535 million from 2008, largely due to loan repayments and sales. Most of the Firm's remaining criticized exposure in this segment remains performing and is substantially secured.
- Leisure: Exposure to this industry decreased by 16% or $1.3 billion from 2008 due to loan repayments and sales, primarily in gaming. While exposure to this industry declined, the criticized component remained elevated due to the continued weakness in the industry, particularly in gaming. The gaming portfolio continues to be managed actively.
- All other: All other in the wholesale credit exposure concentration table on pages 106–107 of this Annual Report at December 31, 2009 (excluding loans held-for-sale and loans at fair value) included $135.8 billion of credit exposure to seven industry segments. Exposures related to SPEs and to Individuals, Private Education & Civic Organizations were 44% and 47%, respectively, of this category. SPEs provide secured financing (generally backed by receivables, loans or bonds) originated by a diverse group of companies in industries that are not highly correlated. For further discussion of SPEs, see Note 16 on pages 214–222 of this Annual Report. The remaining all other exposure is well-diversified across industries and none comprise more than 1.0% of total exposure.

Loans

The following table presents wholesale loans and nonperforming assets by business segment as of December 31, 2009 and 2008.

Corporate/Private Equity	906	—	906	4	—	—	—	4
Total	$ 248,089	$ 13,955	$ 262,044	$ 2,382[a]	$ 1,079	$ 349	$ 39	$ 3,849

(a) The Firm held allowance for loan losses of $2.0 billion and $712 million related to nonperforming retained loans resulting in allowance coverage ratios of 31% and 30%, at December 31, 2009 and 2008, respectively. Wholesale nonperforming loans represent 3.38% and 0.91% of total wholesale loans at December 31, 2009 and 2008, respectively.

(b) Nonperforming derivatives represent less than 1.0% of the total derivative receivables net of cash collateral at both December 31, 2009 and 2008.

In the normal course of business, the Firm provides loans to a variety of customers, from large corporate and institutional clients to high-net-worth individuals.

Retained wholesale loans were $200.1 billion at December 31, 2009, compared with $248.1 billion at December 31, 2008. The $48.0 billion decrease, across most wholesale lines of business, reflected lower customer demand. Loans held-for-sale and loans at fair value relate primarily to syndicated loans and loans transferred from the retained portfolio. Held-for-sale loans and loans carried at fair value were $4.1 billion and $14.0 billion at December 31, 2009 and 2008, respectively. The decreases in both held-for-sale loans and loans at fair value reflected sales, reduced carrying values and lower volumes in the syndication market.

The Firm actively manages wholesale credit exposure through loan and commitment sales. During 2009 and 2008, the Firm sold $3.9 billion of loans and commitments in each year, recognizing losses of $38 million and $41 million in each period, respectively. These results include gains or losses on sales of nonperforming loans, if any, as discussed on page 110 of this Annual Report. These activities are not related to the Firm's securitization activities, which are undertaken for liquidity and balance sheet–management purposes. For further discussion of securitization activity, see Liquidity Risk Management and Note 15 on pages 96–100 and 206–213, respectively, of this Annual Report.

Nonperforming wholesale loans were $6.9 billion at December 31, 2009, an increase of $4.5 billion from December 31, 2008, reflecting continued deterioration in the credit environment, predominantly related to loans in the real estate, leisure and banks and finance companies industries. As of December 31, 2009, wholesale loans restructured as part of a troubled debt restructuring were approximately $1.1 billion.

The following table presents the geographic distribution of wholesale loans and nonperforming loans as of December 31, 2009 and 2008. The geographic distribution of the wholesale portfolio is determined based predominantly on the domicile of the borrower.

Loans and nonperforming loans, U.S. and Non-U.S.

	December 31, 2009		December 31, 2008	
Wholesale (in millions)	Loans	Nonperforming loans	Loans	Nonperforming loans
U.S.	**$ 149,085**	**$ 5,844**	$ 186,776	$ 2,123
Non-U.S.	**55,090**	**1,060**	75,268	259
Ending balance	**$ 204,175**	**$ 6,904**	$ 262,044	$ 2,382

The following table presents the change in the nonperforming loan portfolio for the years ended December 31, 2009 and 2008.

Nonperforming loan activity

Wholesale Year ended December 31, (in millions)	2009	2008
Beginning balance	**$ 2,382**	$ 514
Additions	**13,591**	3,381
Reductions:		
Paydowns and other	**4,964**	859
Gross charge-offs	**2,974**	521
Returned to performing	**341**	93
Sales	**790**	40
Total reductions	**9,069**	1,513
Net additions	**4,522**	1,868
Ending balance	**$ 6,904**	$ 2,382

The following table presents net charge-offs, which are defined as gross charge-offs less recoveries, for the years ended December 31, 2009 and 2008. The amounts in the table below do not include gains from sales of nonperforming loans.

Net charge-offs

Wholesale Year ended December 31, (in millions, except ratios)	2009	2008
Loans – reported		
Average loans retained	**$ 223,047**	$ 219,612
Net charge-offs	**3,132**	402
Average annual net charge-off rate	**1.40%**	0.18%

Derivative contracts

In the normal course of business, the Firm uses derivative instruments to meet the needs of customers; to generate revenue through trading activities; to manage exposure to fluctuations in interest rates, currencies and other markets; and to manage the Firm's credit exposure. For further discussion of these contracts, see Note 5 and Note 32 on pages 175–183 and 242–243 of this Annual Report.

The following tables summarize the net derivative receivables MTM for the periods presented.

Derivative receivables marked to market

December 31, (in millions)	Derivative receivables MTM 2009	2008
Interest rate[a]	**$ 26,777**	$ 49,996
Credit derivatives	**18,815**	44,695
Foreign exchange[a]	**21,984**	38,820
Equity	**6,635**	14,285
Commodity	**5,999**	14,830
Total, net of cash collateral	**80,210**	162,626
Liquid securities collateral held against derivative receivables	**(15,519)**	(19,816)
Total, net of all collateral	**$ 64,691**	$ 142,810

(a) In 2009, cross-currency interest rate swaps previously reported in interest rate contracts were reclassified to foreign exchange contracts to be more consistent with industry practice. The effect of this change resulted in a reclassification of $14.1 billion of cross-currency interest rate swaps to foreign exchange contracts as of December 31, 2008.

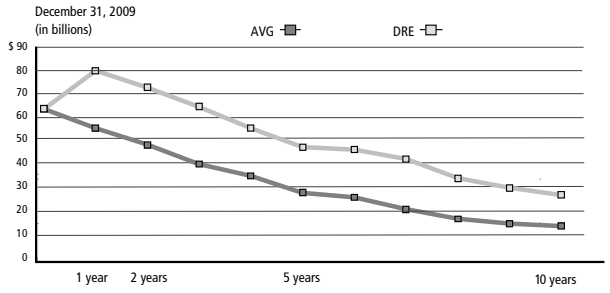
The amount of derivative receivables reported on the Consolidated Balance Sheets of $80.2 billion and $162.6 billion at December 31, 2009 and 2008, respectively, are the amount of the MTM or fair value of the derivative contracts after giving effect to legally enforceable master netting agreements, cash collateral held by the Firm and CVA. These amounts on the Consolidated Balance Sheets represent the cost to the Firm to replace the contracts at current market rates should the counterparty default. However, in management's view, the appropriate measure of current credit risk should also reflect additional liquid securities held as collateral by the Firm of $15.5 billion and $19.8 billion at December 31, 2009 and 2008, respectively, resulting in total exposure, net of all collateral, of $64.7 billion and $142.8 billion at December 31, 2009 and 2008, respectively. The decrease of $78.1 billion in derivative receivables MTM, net of the above mentioned collateral, from December 31, 2008, was primarily related to tightening credit spreads, volatile foreign exchange rates and rising rates on interest rate swaps.

The Firm also holds additional collateral delivered by clients at the initiation of transactions, as well as collateral related to contracts that have a non-daily call frequency and collateral that the Firm has agreed to return but has not yet settled as of the reporting date. Though this collateral does not reduce the balances noted in the table above, it is available as security against potential exposure that could arise should the MTM of the client's derivative transactions move in the Firm's favor. As of December 31, 2009 and 2008, the Firm held $16.9 billion and $22.2 billion of this additional collateral, respectively. The derivative receivables MTM, net of all collateral, also do not include other credit enhancements, such as letters of credit.

While useful as a current view of credit exposure, the net MTM value of the derivative receivables does not capture the potential future variability of that credit exposure. To capture the potential future variability of credit exposure, the Firm calculates, on a client-by-client basis, three measures of potential derivatives-related credit loss: Peak, Derivative Risk Equivalent ("DRE"), and Average exposure ("AVG"). These measures all incorporate netting and collateral benefits, where applicable.

Peak exposure to a counterparty is an extreme measure of exposure calculated at a 97.5% confidence level. DRE exposure is a measure that expresses the risk of derivative exposure on a basis intended to be equivalent to the risk of loan exposures. The measurement is done by equating the unexpected loss in a derivative counterparty exposure (which takes into consideration both the loss volatility and the credit rating of the counterparty) with the unexpected loss in a loan exposure (which takes into consideration only the credit rating of the counterparty). DRE is a less extreme measure of potential credit loss than Peak and is the primary measure used by the Firm for credit approval of derivative transactions.

Finally, AVG is a measure of the expected MTM value of the Firm's derivative receivables at future time periods, including the benefit of collateral. AVG exposure over the total life of the derivative contract is used as the primary metric for pricing purposes and is used to calculate credit capital and the CVA, as further described below. AVG exposure was $49.0 billion and $83.7 billion at December 31, 2009 and 2008, respectively, compared with derivative receivables MTM, net of all collateral, of $64.7 billion and $142.8 billion at December 31, 2009 and 2008, respectively.



The MTM value of the Firm's derivative receivables incorporates an adjustment, the CVA, to reflect the credit quality of counterparties.

The CVA is based on the Firm's AVG to a counterparty and the counterparty's credit spread in the credit derivatives market. The primary components of changes in CVA are credit spreads, new deal activity or unwinds, and changes in the underlying market environment. The Firm believes that active risk management is essential to controlling the dynamic credit risk in the derivatives portfolio. In addition, the Firm takes into consideration the potential for correlation between the Firm's AVG to a counterparty and the counterparty's credit quality within the credit approval process. The Firm risk manages exposure to changes in CVA by entering into credit derivative transactions, as well as interest rate, foreign exchange, equity and commodity derivative transactions.

The accompanying graph shows exposure profiles to derivatives over the next ten years as calculated by the DRE and AVG metrics.

The two measures generally show declining exposure after the first year, if no new trades were added to the portfolio.

Exposure profile of derivatives measures

The following table summarizes the ratings profile of the Firm's derivative receivables MTM, net of other liquid securities collateral, for the dates indicated.

Ratings profile of derivative receivables MTM

Rating equivalent	**2009**		2008	
December 31, (in millions, except ratios)	Exposure net of of all collateral	% of exposure net of all collateral	Exposure net of of all collateral	% of exposure net of all collateral
AAA/Aaa to AA-/Aa3	**$ 25,530**	**40%**	$ 68,708	48%
A+/A1 to A-/A3	**12,432**	**19**	24,748	17
BBB+/Baa1 to BBB-/Baa3	**9,343**	**14**	15,747	11
BB+/Ba1 to B-/B3	**14,571**	**23**	28,186	20
CCC+/Caa1 and below	**2,815**	**4**	5,421	4
Total	**$ 64,691**	**100%**	$ 142,810	100%

The Firm actively pursues the use of collateral agreements to mitigate counterparty credit risk in derivatives. The percentage of the Firm's derivatives transactions subject to collateral agreements – excluding foreign exchange spot trades, which are not typically covered by collateral agreements due to their short maturity – was 89% as of December 31, 2009, largely unchanged from 88% at December 31, 2008.

The Firm posted $56.7 billion and $99.1 billion of collateral at December 31, 2009 and 2008, respectively.

Certain derivative and collateral agreements include provisions that require the counterparty and/or the Firm, upon specified downgrades in the respective credit ratings of their legal entities, to post collateral for the benefit of the other party. At December 31, 2009, the impact of a single-notch and six-notch ratings downgrade to JPMorgan Chase & Co., and its subsidiaries, primarily JPMorgan Chase Bank, N.A., would have required $1.2 billion and $3.6 billion, respectively, of additional collateral to be posted by the Firm. Certain derivative contracts also provide for termination of the contract, generally upon a downgrade to a specified rating of either the Firm or the counterparty, at the then-existing MTM value of the derivative contracts.

Credit derivatives

Credit derivatives are financial contracts that isolate credit risk from an underlying instrument (such as a loan or security) and transfers that risk from one party (the buyer of credit protection) to another (the seller of credit protection). The Firm is both a purchaser and seller of credit protection. As a purchaser of credit protection, the Firm has risk that the counterparty providing the credit protection will default. As a seller of credit protection, the Firm has risk that the underlying instrument referenced in the contract will be subject to a credit event. Of the Firm's $80.2 billion of total derivative receivables MTM at December 31, 2009, $18.8 billion, or 23%, was associated with credit derivatives, before the benefit of liquid securities collateral.

One type of credit derivatives the Firm enters into with counterparties are credit default swaps ("CDS"). For further detailed discussion of these and other types of credit derivatives, see Note 5 on pages 175–183 of this Annual Report. The large majority of CDS are subject to collateral arrangements to protect the Firm from counterparty credit risk. In 2009, the frequency and size of defaults for both trading counterparties and the underlying debt referenced in credit derivatives were well above historical norms. The use of collateral to settle against defaulting counterparties generally performed as designed in significantly mitigating the Firm's exposure to these counterparties.

The Firm uses credit derivatives for two primary purposes: first, in its capacity as a market-maker in the dealer/client business to meet the needs of customers; and second, in order to mitigate the Firm's own credit risk associated with its overall derivative receivables and traditional commercial credit lending exposures (loans and unfunded commitments).

The following table presents the Firm's notional amounts of credit derivatives protection purchased and sold as of December 31, 2009 and 2008, distinguishing between dealer/client activity and credit portfolio activity.

	Notional amount				
	Dealer/client		Credit portfolio		
December 31, (in billions)	Protection purchased[a]	Protection sold	Protection purchased[a][b]	Protection sold	Total
2009	**$2,997**	**$2,947**	**$ 49**	**$ 1**	**$ 5,994**
2008	$ 4,193	$ 4,102	$ 92	$ 1	$ 8,388

(a) Included $3.0 trillion and $4.0 trillion at December 31, 2009 and 2008, respectively, of notional exposure within protection purchased where the Firm has protection sold with identical underlying reference instruments. For a further discussion on credit derivatives, see Note 5 on pages 175–183 of this Annual Report.

(b) Included $19.7 billion and $34.9 billion at December 31, 2009 and 2008, respectively, that represented the notional amount for structured portfolio protection; the Firm retains the first risk of loss on this portfolio.

Dealer/client business

Within the dealer/client business, the Firm actively manages credit derivatives by buying and selling credit protection, predominantly on corporate debt obligations, according to client demand for credit risk protection on the underlying reference instruments. Protection may be bought or sold by the Firm on single reference debt instruments ("single-name" credit derivatives), portfolios of referenced instruments ("portfolio" credit derivatives) or quoted indices ("indexed" credit derivatives). The risk positions are largely matched as the Firm's exposure to a given reference entity under a contract to sell protection to a counterparty may be offset partially, or entirely, with a contract to purchase protection from another counterparty on the same underlying instrument. Any residual default exposure and spread risk is actively managed by the Firm's various trading desks.

At December 31, 2009, the total notional amount of protection purchased and sold decreased by $2.4 trillion from year-end 2008. The decrease was primarily due to the impact of industry efforts to reduce offsetting trade activity.

Credit portfolio activities

Management of the Firm's wholesale exposure is accomplished through a number of means including loan syndication and participations, loan sales, securitizations, credit derivatives, use of master netting agreements, and collateral and other risk-reduction techniques. The Firm also manages its wholesale credit exposure by purchasing protection through single-name and portfolio credit derivatives to manage the credit risk associated with loans, lending-related commitments and derivative receivables. Gains or losses on the credit derivatives are expected to offset the unrealized increase or decrease in credit risk on the loans, lending-related commitments or derivative receivables. This activity does not reduce the reported level of assets on the balance sheet or the level of reported off–balance sheet commitments, although it does provide the Firm with credit risk protection. The Firm also diversifies its exposures by selling credit protection, which increases exposure to industries or clients where the Firm has little or no client-related exposure; however, this activity is not material to the Firm's overall credit exposure.

Use of single-name and portfolio credit derivatives

	Notional amount of protection purchased and sold	
December 31, (in millions)	**2009**	2008
Credit derivatives used to manage:		
Loans and lending-related commitments	**$ 36,873**	$ 81,227
Derivative receivables	**11,958**	10,861
Total protection purchased[a]	**$ 48,831**	$ 92,088
Total protection sold	**455**	637
Credit derivatives hedges notional	**$ 48,376**	$ 91,451

(a) Included $19.7 billion and $34.9 billion at December 31, 2009 and 2008, respectively, that represented the notional amount for structured portfolio protection; the Firm retains the first risk of loss on this portfolio.

The credit derivatives used by JPMorgan Chase for credit portfolio management activities do not qualify for hedge accounting under U.S. GAAP; these derivatives are reported at fair value, with gains and losses recognized in principal transactions revenue. In contrast, the loans and lending-related commitments being risk-managed are accounted for on an accrual basis. This asymmetry in accounting treatment, between loans and lending-related commitments and the credit derivatives used in credit portfolio management activities, causes earnings volatility that is not representative, in the Firm's view, of the true changes in value of the Firm's overall credit exposure. The MTM related to the Firm's credit derivatives used for managing credit exposure, as well as the MTM related to the CVA (which reflects the credit quality of derivatives counterparty exposure) are included in the gains and losses realized on credit derivatives disclosed in the table below. These results can vary from period to period due to market conditions that affect specific positions in the portfolio.

Year ended December 31, (in millions)	**2009**	2008	2007
Hedges of lending-related commitments[a]	**$ (3,258)**	$ 2,216	$ 350
CVA and hedges of CVA[a]	**1,920**	(2,359)	(363)
Net gains/(losses)[b]	**$ (1,338)**	$ (143)	$ (13)

(a) These hedges do not qualify for hedge accounting under U.S. GAAP.

(b) Excludes losses of $2.7 billion and gains of $530 million and $373 million for the years ended December 31, 2009, 2008 and 2007, respectively, of other principal transactions revenue that are not associated with hedging activities.

Lending-related commitments

JPMorgan Chase uses lending-related financial instruments, such as commitments and guarantees, to meet the financing needs of its customers. The contractual amount of these financial instruments represents the maximum possible credit risk should the counterparties draw down on these commitments or the Firm fulfills its obligation under these guarantees, and the counterparties subsequently fail to perform according to the terms of these contracts.

Wholesale lending-related commitments were $347.2 billion at December 31, 2009, compared with $379.9 billion at December 31, 2008, reflecting lower customer demand. In the Firm's view, the total contractual amount of these wholesale lending-related commitments is not representative of the Firm's actual credit risk exposure or funding requirements. In determining the amount of credit risk exposure the Firm has to wholesale lending-related commitments, which is used as the basis for allocating credit risk capital to these commitments, the Firm has established a "loan-equivalent" amount for each commitment; this amount represents the portion of the unused commitment or other contingent exposure that is expected, based on average portfolio historical experience, to become drawn upon in an event of a default by an obligor. The loan-equivalent amounts of the Firm's lending-related commitments were $179.8 billion and $204.3 billion as of December 31, 2009 and 2008, respectively.

Emerging markets country exposure

The Firm has a comprehensive internal process for measuring and managing exposures to emerging markets countries. There is no common definition of emerging markets, but the Firm generally includes in its definition those countries whose sovereign debt ratings are equivalent to "A+" or lower. Exposures to a country include all credit-related lending, trading and investment activities, whether cross-border or locally funded. In addition to monitoring country exposures, the Firm uses stress tests to measure and manage the risk of extreme loss associated with sovereign crises.

The table below presents the Firm's exposure, by country, to the top ten emerging markets. The selection of countries is based solely on the Firm's largest total exposures by country and not the Firm's view of any actual or potentially adverse credit conditions. Exposure is reported based on the country where the assets of the obligor, counterparty or guarantor are located. Exposure amounts are adjusted for collateral and for credit enhancements (e.g., guarantees and letters of credit) provided by third parties; outstandings supported by a guarantor located outside the country or backed by collateral held outside the country are assigned to the country of the enhancement provider. In addition, the effect of credit derivative hedges and other short credit or equity trading positions are reflected in the table below. Total exposure includes exposure to both government and private-sector entities in a country.

Top 10 emerging markets country exposure

At December 31, 2009	Cross-border					**Total**
(in billions)	Lending[a]	Trading[b]	Other[c]	Total	Local[d]	**exposure**

Mexico	1.9	0.3	0.3	2.5	—	2.5
South Africa	0.9	0.5	0.4	1.8	—	1.8
Russia	1.3	0.2	0.3	1.8	—	1.8

(a) Lending includes loans and accrued interest receivable, interest-bearing deposits with banks, acceptances, other monetary assets, issued letters of credit net of participations, and undrawn commitments to extend credit.
(b) Trading includes: (1) issuer exposure on cross-border debt and equity instruments, held both in trading and investment accounts and adjusted for the impact of issuer hedges, including credit derivatives; and (2) counterparty exposure on derivative and foreign exchange contracts as well as securities financing trades (resale agreements and securities borrowed).
(c) Other represents mainly local exposure funded cross-border, including capital investments in local entities.
(d) Local exposure is defined as exposure to a country denominated in local currency and booked locally. Any exposure not meeting these criteria is defined as cross-border exposure.

CONSUMER CREDIT PORTFOLIO

JPMorgan Chase's consumer portfolio consists primarily of residential mortgages, home equity loans, credit cards, auto loans, student loans and business banking loans, with a primary focus on serving the prime consumer credit market. The portfolio also includes home equity loans and lines of credit secured by junior liens, mortgage loans with interest-only payment options to predominantly prime borrowers, as well as certain payment-option loans acquired from Washington Mutual that may result in negative amortization.

A substantial portion of the consumer loans acquired in the Washington Mutual transaction were identified as credit-impaired based on an analysis of high-risk characteristics, including product type, loan-to-value ratios, FICO scores and delinquency status. These purchased credit-impaired loans are accounted for on a pool basis, and the pools are considered to be performing. At the time of the acquisition, these loans were recorded at fair value, including an estimate of losses that were expected to be incurred over the estimated remaining lives of the loan pools. Therefore, no allowance for loan losses was recorded for these loans as of the transaction date. In 2009, management concluded that it was probable that higher expected future credit losses for certain pools of the purchased credit-impaired portfolio would result in a decrease in expected future cash flows for these pools. As a result, an allowance for loan losses of $1.6 billion was established.

The credit performance of the consumer portfolio across the entire product spectrum continues to be negatively affected by the economic environment. Higher unemployment and weaker overall economic conditions have led to a significant increase in the number of loans charged off, while continued weak housing prices have driven a significant increase in the severity of loss recognized on real estate loans that default. Delinquencies and nonperforming loans continued to increase in 2009. The increases in these credit quality metrics were due, in part, to foreclosure moratorium programs, which ended in early 2009. These moratoriums halted stages of the foreclosure process while the U.S. Treasury developed its homeowner assistance program (i.e., MHA) and the Firm enhanced its foreclosure-prevention programs. Due to a high volume of foreclosures after the moratoriums, processing timelines for foreclosures were elongated by approximately 100 days. Losses related to these loans continued to be recognized in accordance with the Firm's normal charge-off practices, but some delinquent loans that would have otherwise been foreclosed upon remain in the mortgage and home equity loan portfolios. Additional deterioration in the overall economic environment, including continued deterioration in the labor and residential real estate markets, could cause delinquencies and losses to increase beyond the Firm's current expectations.

Since mid-2007, the Firm has taken actions to reduce risk exposure to consumer loans by tightening both underwriting and loan qualification standards for both real estate and non-real estate lending products. For residential real estate lending, tighter income verification, more conservative collateral valuation, reduced loan-to-value maximums, and higher FICO and custom risk score requirements are just some of the actions taken to date to mitigate risk related to new originations. The Firm believes that these actions have better aligned loan pricing with the underlying credit risk of the loans. In addition, originations of subprime mortgage loans, stated income and broker-originated mortgage and home equity loans have been eliminated entirely to further reduce originations with high-risk characteristics. The Firm has never originated option adjustable-rate mortgages. The tightening of underwriting criteria for auto loans has resulted in the reduction of both extended-term and high loan-to-value financing.

As a further action to reduce risk associated with lending-related commitments, the Firm has reduced or canceled certain lines of credit as permitted by law. For example, the Firm may reduce or close home equity lines of credit when there are significant decreases in the value of the underlying property or when there has been a demonstrable decline in the creditworthiness of the borrower. Similarly, certain inactive credit card lines have been closed and a number of active credit card lines have been reduced.

The following table presents managed consumer credit–related information (including RFS, CS and residential real estate loans reported in the Corporate/Private Equity segment) for the dates indicated. For further information about the Firm's nonaccrual and charge-off accounting policies, see Note 13 on pages 200–204 of this Annual Report.

Consumer portfolio

As of or for the year ended December 31, (in millions, except ratios)	Credit exposure		Nonperforming loans[i][j]		90 days or more past due and still accruing[j]		Net charge-offs		Average annual net charge-off rate[k]

(a) Represents loans where JPMorgan Chase holds the first security interest on the property.
(b) Represents loans where JPMorgan Chase holds a security interest that is subordinate in rank to other liens.
(c) Excludes operating lease-related assets of $2.9 billion and $2.2 billion for December 31, 2009 and 2008, respectively.
(d) Includes $1.0 billion of loans at December 31, 2009, held by the Washington Mutual Master Trust, which were consolidated onto the Firm's Consolidated Balance Sheets at fair value during the second quarter of 2009.
(e) Includes billed finance charges and fees net of an allowance for uncollectible amounts.
(f) Charge-offs are not recorded on purchased credit-impaired loans until actual losses exceed estimated losses that were recorded as purchase accounting adjustments at the time of acquisition. To date, no charge-offs have been recorded for these loans. If charge-offs were reported comparable to the non-credit impaired portfolio, life-to-date principal charge-offs would have been $16.7 billion.
(g) Represents securitized credit card receivables. For a further discussion of credit card securitizations, see CS on pages 72–74 of this Annual Report.

(h) The credit card and home equity lending-related commitments represent the total available lines of credit for these products. The Firm has not experienced, and does not anticipate, that all available lines of credit would be utilized at the same time. For credit card commitments and home equity commitments (if certain conditions are met), the Firm can reduce or cancel these lines of credit by providing the borrower prior notice or, in some cases, without notice as permitted by law.

(i) At December 31, 2009 and 2008, nonperforming loans excluded: (1) mortgage loans insured by U.S. government agencies of $9.0 billion and $3.0 billion, respectively; and (2) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program, of $542 million and $437 million, respectively. These amounts are excluded, as reimbursement is proceeding normally. In addition, the Firm's policy is generally to exempt credit card loans from being placed on nonaccrual status as permitted by regulatory guidance. Under guidance issued by the Federal Financial Institutions Examination Council, credit card loans are charged off by the end of the month in which the account becomes 180 days past due or within 60 days from receiving notification about a specified event (e.g., bankruptcy of the borrower), whichever is earlier.

(j) Excludes purchased credit-impaired loans that were acquired as part of the Washington Mutual transaction, which are accounted for on a pool basis. Since each pool is accounted for as a single asset with a single composite interest rate and an aggregate expectation of cash flows, the past due status of the pools, or that of individual loans within the pools, is not meaningful. Because the Firm is recognizing interest income on each pool of loans, they are all considered to be performing.

(k) Average consumer loans held-for-sale and loans at fair value were $2.2 billion and $2.8 billion for the years ended December 31, 2009 and 2008, respectively. These amounts were excluded when calculating the net charge-off rates.

The following table presents consumer nonperforming assets by business segment as of December 31, 2009 and 2008.

Consumer nonperforming assets

	2009				2008			
		Assets acquired in loan satisfactions				Assets acquired in loan satisfactions		
As of December 31, (in millions)	Nonperforming loans	Real estate owned	Other	Nonperforming assets	Nonperforming loans	Real estate owned	Other	Nonperforming assets
Retail Financial Services[a]	**$10,611**	**$ 1,154**	**$ 99**	**$11,864**	$ 6,548	$ 2,183	$ 110	$ 8,841
Card Services[a]	**3**	**—**	**—**	**3**	4	—	—	4
Corporate/Private Equity	**46**	**2**	**—**	**48**	19	1	—	20
Total	**$10,660**	**$ 1,156**	**$ 99**	**$11,915**	$ 6,571	$ 2,184	$ 110	$ 8,865

(a) At December 31, 2009 and 2008, nonperforming loans and assets excluded: (1) mortgage loans insured by U.S. government agencies of $9.0 billion and $3.0 billion, respectively; (2) real estate owned insured by U.S. government agencies of $579 million and $364 million, respectively; and (3) student loans that are 90 days past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program, of $542 million and $437 million, respectively. These amounts are excluded, as reimbursement is proceeding normally. In addition, the Firm's policy is generally to exempt credit card loans from being placed on nonaccrual status as permitted by regulatory guidance. Under guidance issued by the Federal Financial Institutions Examination Council, credit card loans are charged off by the end of the month in which the account becomes 180 days past due or within 60 days from receiving notification about a specified event (e.g., bankruptcy of the borrower), whichever is earlier.

The following discussion relates to the specific loan product and lending-related categories within the consumer portfolio. Purchased credit-impaired loans are excluded from individual loan product discussions and addressed separately below.

Home equity: Home equity loans at December 31, 2009 were $101.4 billion, a decrease of $12.9 billion from year-end 2008. The decrease primarily reflected lower loan originations, coupled with loan paydowns and charge-offs. The 2009 provision for credit losses for the home equity portfolio included net increases of $2.1 billion to the allowance for loan losses, reflecting the impact of the weak housing prices and higher unemployment. Senior lien nonperforming loans increased from the prior year due to the weak economic environment, while junior lien nonperforming loans were relatively unchanged. Net charge-offs have increased from the prior year due to higher frequency and severity of losses.

Mortgage: Mortgage loans at December 31, 2009, which include prime mortgages, subprime mortgages, adjustable-rate mortgages ("option ARMs") acquired in the Washington Mutual transaction and mortgage loans held-for-sale, were $88.3 billion, representing an $8.5 billion decrease from year-end 2008. The decrease is due to lower prime mortgage loans retained in the portfolio and higher loan charge-offs, as well as the run-off of the subprime and option ARM portfolios. Net charge-offs have increased from the prior year across all segments of the mortgage portfolio due to both higher frequency and a significant increase in the severity of losses.

Prime mortgages of $67.3 billion decreased $5.2 billion from December 31, 2008. The 2009 provision for credit losses included a net increase of $1.0 billion to the allowance for loan losses reflecting the impact of the weak economic environment. Early-stage delinquencies improved in the latter part of the year, while late-stage delinquencies have increased as a result of prior foreclosure moratoriums and ongoing trial modification activity, driving an increase in nonperforming loans.

Subprime mortgages of $12.5 billion decreased $2.8 billion from December 31, 2008, as a result of paydowns, discontinuation of new originations and charge-offs on delinquent loans. The 2009 provision for credit losses included a net increase of $625 million to the allowance for loan losses, reflecting the impact of high loss severities driven by declining home prices.

Option ARMs of $8.5 billion represent less than 5% of non-purchased credit-impaired real estate loans and were $482 million lower than December 31, 2008, due to run-off of the portfolio. This portfolio is primarily comprised of loans with low loan-to-value ratios and high borrower FICOs. Accordingly, the Firm currently expects substantially lower losses on this portfolio when compared with the purchased credit-impaired option ARM portfolio. The cumulative amount of unpaid interest added to the unpaid principal balance due to negative amortization of option ARMs was $78 million at December 31, 2009. New originations of option ARMs were discontinued by Washington Mutual prior to the date of JPMorgan Chase's acquisition of Washington Mutual. The Firm has not originated, and does not originate, option ARMs.

Auto loans: As of December 31, 2009, auto loans were $46.0 billion, an increase of $3.4 billion from year-end 2008, partially as a result of new originations in connection with the U.S. government's "cash for clunkers" program in the third quarter. Delinquent loans were slightly lower than the prior year. Loss severities also decreased as a result of higher used-car prices nationwide. The auto loan portfolio reflects a high concentration of prime quality credits.

Credit card: JPMorgan Chase analyzes its credit card portfolio on a managed basis, which includes credit card receivables on the Consolidated Balance Sheets and those receivables sold to investors through securitizations. Managed credit card receivables were $163.4 billion at December 31, 2009, a decrease of $26.9 billion from year-end 2008, reflecting lower charge volume and a higher level of charge-offs.

The 30-day managed delinquency rate increased to 6.28% at December 31, 2009, from 4.97% at December 31, 2008, and the managed credit card net charge-off rate increased to 9.33% in 2009, from 5.01% in 2008. These increases reflect the current weak economic environment, especially in metropolitan statistical areas ("MSAs") experiencing the greatest housing price depreciation and highest unemployment and to the credit performance of loans acquired in the Washington Mutual transaction. The allowance for loan losses was increased by $2.0 billion for 2009, reflecting a provision for loan losses of $2.4 billion, partially offset by the reclassification of $298 million related to an issuance and retention of securities from the Chase Issuance Trust. The managed credit card portfolio continues to reflect a well-seasoned, largely rewards-based portfolio that has good U.S. geographic diversification.

Managed credit card receivables, excluding the Washington Mutual portfolio, were $143.8 billion at December 31, 2009, compared with $162.1 billion at December 31, 2008. The 30-day managed delinquency rate was 5.52% at December 31, 2009, up from 4.36% at December 31, 2008; the managed credit card net charge-off rate, excluding the Washington Mutual portfolio increased to 8.45% in 2009 from 4.92% in 2008.

Managed credit card receivables of the Washington Mutual portfolio were $19.7 billion at December 31, 2009, compared with $28.3 billion at December 31, 2008. Excluding the impact of the purchase accounting adjustments related to the Washington Mutual transaction and the consolidation of the Washington Mutual Master Trust, the Washington Mutual portfolio's 30-day managed delinquency rate was 12.72% at December 31, 2009, compared with 9.14% at December 31, 2008, and the 2009 net charge-off rate was 18.79%.

All other: All other loans primarily include business banking loans (which are highly collateralized loans, often with personal loan guarantees), student loans, and other secured and unsecured consumer loans. As of December 31, 2009, other loans, including loans held-for-sale, were $33.6 billion, down $2.0 billion from year-end 2008, primarily as a result of lower business banking loans. The 2009 provision for credit losses reflected a net increase of $580 million to the allowance for loan losses and an increase in net charge-offs of $826 million related to the business banking and student loan portfolios, reflecting the impact of the weak economic environment.

Purchased credit-impaired: Purchased credit-impaired loans were $81.2 billion at December 31, 2009, compared with $88.8 billion at December 31, 2008. This portfolio represents loans acquired in the Washington Mutual transaction that were recorded at fair value at the time of acquisition. The fair value of these loans included an estimate of credit losses expected to be realized over the remaining lives of the loans, and therefore no allowance for loan losses was recorded for these loans as of the acquisition date.

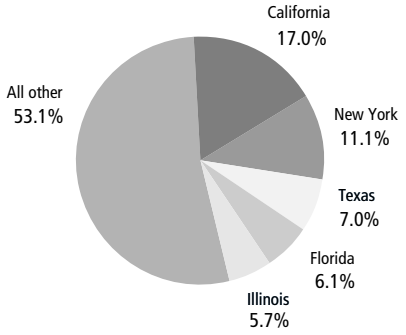
The Firm regularly updates the amount of expected loan principal and interest cash flows to be collected for these loans. Probable decreases in expected loan principal cash flows trigger the recognition of impairment through the provision for loan losses. Probable and significant increases in expected loan principal cash flows would first result in the reversal of any allowance for loan losses. Any remaining increase in the expected principal cash flows would be recognized prospectively in interest income over the remaining lives of the underlying loans.

During 2009, management concluded that it was probable that higher expected principal credit losses for the purchased credit-impaired prime mortgage and option ARM pools would result in a decrease in expected cash flows for these pools. As a result, an allowance for loan losses of $1.1 billion and $491 million, respectively, was established for these pools. The credit performance of the other pools has generally been consistent with the estimate of losses at the acquisition date. Accordingly, no impairment for these other pools has been recognized.

Concentrations of credit risk – consumer loans other than purchased credit-impaired loans

Following is tabular information and, where appropriate, supplemental discussions about certain concentrations of credit risk for the Firm's consumer loans, other than purchased credit-impaired loans, including:

- Geographic distribution of loans, including certain residential real estate loans with high loan-to-value ratios; and
- Loans that are 30+ days past due.



The following tables present the geographic distribution of managed consumer credit outstandings by product as of December 31, 2009 and 2008, excluding purchased credit-impaired loans.

Top 5 States Consumer Loans - Managed[a]
(at December 31, 2009)

Top 5 States Consumer Loans - Managed[a]
(at December 31, 2008)

(a) Excluding the purchased credit-impaired loans acquired in the Washington Mutual transaction.

The following table presents the geographic distribution of certain residential real estate loans with current estimated combined loan-to-value ratios ("LTVs") in excess of 100% as of December 31, 2009 and 2008, excluding purchased credit-impaired loans acquired in the Washington Mutual transaction. The estimated collateral values used to calculate the current estimated combined LTV ratios in the following table were derived from a nationally recognized home price index measured at the MSAs level. Because home price indices can have wide variability and such derived real estate values do not represent actual appraised loan-level collateral values, the resulting ratios are necessarily imprecise and should therefore be viewed as estimates.

Geographic distribution of residential real estate loans with current estimated combined LTVs > 100%[a]

Total portfolio average current estimated combined LTV[b]	91	83	91		

(a) Home equity–junior lien, prime mortgage and subprime mortgage loans with current estimated combined LTVs greater than 80% up to and including 100% were $17.9 billion, $17.6 billion and $3.5 billion, respectively, at December 31, 2009.
(b) The average current estimated combined LTV ratio reflects the outstanding balance at the balance sheet date, divided by the estimated current property value. Current property values are estimated based on home valuation models utilizing nationally recognized home price index valuation estimates.
(c) Represents combined loan-to-value, which considers all available lien positions related to the property.
(d) Includes mortgage loans insured by the U.S. government agencies of $5.3 billion and $1.8 billion at December 31, 2009 and 2008, respectively.
(e) Represents total loans of the product types noted in this table by geographic location.
(f) December 2008 estimated collateral values for the heritage Washington Mutual portfolio have been changed to conform to values derived from the home price index used for the JPMorgan Chase portfolio. Home price indices generally have different valuation methods and assumptions and therefore can yield a wide range of estimates.

The consumer credit portfolio is geographically diverse. The greatest concentration of loans is in California, which represents 18% of total on-balance sheet consumer loans and 24% of total residential real estate loans at December 2009, compared to 19% and 25%, respectively, at December 2008. Of the total on-balance sheet consumer loan portfolio, $149.4 billion, or 43%, are concentrated in California, New York, Arizona, Florida and Michigan at December 2009 compared to $171.1 billion, or 43%, at December 2008.

Declining home prices have had a significant impact on the estimated collateral value underlying the Firm's residential real estate loan portfolio. In general, the delinquency rate for loans with high current estimated combined LTV ratios is greater than the delinquency rate for loans in which the borrower has equity in the collateral. While a large portion of the loans with current estimated combined LTV ratios greater than 100% continue to pay and are current, the continued willingness and ability of these borrowers to pay is currently uncertain. Nonperforming loans in the residential real estate portfolio totaled $9.6 billion, of which 64% was greater than 150 days past due at December 31, 2009. Of the nonperforming loans that were greater than 150 days past due at December 31, 2009, approximately 36% of the unpaid principal balance of these loans has been charged-down to estimated collateral value.

Consumer 30+ day delinquency information

	30+ day delinquent loans		30+ day delinquency rate	
December 31, (in millions, except ratios)	**2009**	2008	**2009**	2008
Consumer loans – excluding purchased credit-impaired loans[a]				
Home equity – senior lien	**$ 833**	$ 585	**3.04%**	1.96%
Home equity – junior lien	**2,515**	2,563	**3.40**	3.03
Prime mortgage	**5,532**[b]	3,180[b]	**8.21**[d]	4.39[d]
Subprime mortgage	**4,232**	3,760	**33.79**	24.53
Option ARMs	**438**	68	**5.13**	0.75
Auto loans	**750**	963	**1.63**	2.26
Credit card – reported	**6,093**	5,653	**7.73**	5.40
All other loans	**1,306**[c]	708[c]	**3.91**	1.99
Total consumer loans – excluding purchased credit-impaired loans – reported	**$ 21,699**	$ 17,480	**6.23%**	4.44%
Credit card – securitized	**4,174**	3,811	**4.93**	4.45
Total consumer loans – excluding purchased credit-impaired loans – managed	**$ 25,873**	$ 21,291	**5.98%**	4.44%
Memo: Credit card – managed	**$ 10,267**	$ 9,464	**6.28%**	4.97%

(a) The delinquency rate for purchased credit-impaired loans, which is based on the unpaid principal balance, was 27.79% and 17.89% at December 31, 2009 and 2008, respectively.

(b) Excludes 30+ day delinquent mortgage loans that are insured by U.S. government agencies of $9.7 billion and $3.5 billion at December 31, 2009 and 2008, respectively. These amounts are excluded, as reimbursement is proceeding normally.

(c) Excludes 30+ day delinquent loans that are 30 days or more past due and still accruing, which are insured by U.S. government agencies under the Federal Family Education Loan Program, of $942 million and $824 million at December 31, 2009 and 2008, respectively. These amounts are excluded as reimbursement is proceeding normally.

(d) The denominator for the calculation of the 30+ day delinquency rate includes: (1) residential real estate loans reported in the Corporate/Private Equity segment; and (2) mortgage loans insured by U.S. government agencies. The 30+ day delinquency rate excluding these loan balances was 11.24% and 5.14% at December 31, 2009 and 2008, respectively.

Consumer 30+ day delinquencies have increased to 6.23% of the consumer loan portfolio at December 31, 2009, in comparison to 4.44% at December 31, 2008, driven predominately by an increase in residential real estate delinquencies which increased $3.4 billion. Late stage delinquencies (150+ days delinquent) increased significantly reflecting the impacts of trial loan modifications and foreclosure moratorium backlogs. Losses related to these loans continue to be recognized in accordance with the Firm's normal charge-off practices; as such, these loans are reflected at their estimated collateral value. Early stage delinquencies (30 - 89 days delinquent) in the residential real estate portfolios have remained relatively flat year over year.

Concentrations of credit risk – purchased credit-impaired loans

The following table presents the current estimated combined LTV ratio, as well as the ratio of the carrying value of the underlying loans to the current estimated collateral value, for purchased credit-impaired loans. Because such loans were initially measured at fair value, the ratio of the carrying value to the current estimated collateral value will be lower than the current estimated combined LTV ratio, which is based on the unpaid principal balance. The estimated collateral values used to calculate these ratios were derived from a nationally recognized home price index measured at the MSA level. Because home price indices can have wide variability, and such derived real estate values do not represent actual appraised loan-level collateral values, the resulting ratios are necessarily imprecise and should therefore be viewed as estimates.

Combined LTV ratios and ratios of carrying values to current estimated collateral values – purchased credit-impaired

December 31, 2009 (in billions, except ratios)	Unpaid principal balance[b]	Current estimated combined LTV ratio[c][d]	Carrying value[e]	Ratio of carrying value to current estimated collateral value
Option ARMs[a]	**$ 37.4**	**128%**	**$ 29.0**	**98%**[f]
Home equity	**32.9**	**127**	**26.5**	**102**
Prime mortgage	**22.0**	**121**	**19.7**	**102**[f]
Subprime mortgage	**9.0**	**122**	**6.0**	**81**

December 31, 2008[g] (in billions, except ratios)	Unpaid principal balance[b]	Current estimated combined LTV ratio[c][d]	Carrying value[e]	Ratio of carrying value to current estimated collateral value
Option ARMs	$ 41.6	113%	$ 31.6	86%
Home equity	39.8	115	28.6	82
Prime mortgage	25.0	107	21.8	94
Subprime mortgage	10.3	112	6.8	73

(a) The cumulative amount of unpaid interest that has been added to the unpaid principal balance of option ARMs was $1.9 billion at December 31, 2009. Assuming market interest rates, the Firm would expect the following balance of current loans to experience a payment recast: $6.3 billion in 2010 and $3.9 billion in 2011, of which $4.8 billion and $3.7 billion relate to the purchased credit-impaired portfolio.

(b) Represents the contractual amount of principal owed.

(c) Represents the aggregate unpaid principal balance of loans divided by the estimated current property value. Current property values are estimated based on home valuation models utilizing nationally recognized home price index valuation estimates.

(d) Represents current estimated combined loan-to-value, which considers all available lien positions related to the property.

(e) Carrying values include the effect of fair value adjustments that were applied to the consumer purchased credit-impaired portfolio at the date of acquisition.

(f) Ratios of carrying value to current estimated collateral value for the prime mortgage and option ARM portfolios are net of the allowance for loan losses of $1.1 billion and $491 million, respectively, as of December 31, 2009.

(g) December 2008 estimated collateral values for the heritage Washington Mutual portfolio have been changed to conform to values derived from home price index used for the JPMorgan Chase portfolio. Home price indices generally have different valuation methods and assumptions and therefore can yield a wide range of estimates.

Purchased credit-impaired loans in the states of California and Florida represented 54% and 11%, respectively, of total purchased credit-impaired loans at December 31, 2009, compared with 53% and 11%, respectively, at December 31, 2008. The current estimated combined LTV ratios were 137% and 149% for California and Florida loans, respectively, at December 31, 2009, compared with 121% and 125%, respectively, at December 31, 2008. Loan concentrations in California and Florida, as well as the continuing decline in housing prices in those states, have contributed negatively to both the current estimated combined LTV ratio and the ratio of carrying value to current collateral value for loans in the purchased credit-impaired portfolio.

While the carrying value of the purchased credit-impaired loans is marginally below the current collateral value of the loans, the ultimate performance of this portfolio is highly dependent on the borrowers' behavior and ongoing ability and willingness to continue to make payments on homes with negative equity as well as the cost of alternative housing. The purchased credit-impaired portfolio was recorded at fair value at the time of acquisition which included an estimate of losses expected to be incurred over the estimated remaining lives of the loan pools. During 2009, management concluded that it was probable that higher than expected future principal credit losses would result in a decrease in the expected future cash flows of the prime and option ARM pools. As a result an allowance for loan losses of $1.6 billion was established.

Residential real estate loan modification activities: During 2009, the Firm reviewed its residential real estate portfolio to identify homeowners most in need of assistance, opened new regional counseling centers, hired additional loan counselors, introduced new financing alternatives, proactively reached out to borrowers to offer pre-qualified modifications, and commenced a new process to independently review each loan before moving it into the foreclosure process. In addition, during the first quarter of 2009, the U.S. Treasury introduced the MHA programs, which are designed to assist eligible homeowners in a number of ways, one of which is by modifying the terms of their mortgages. The Firm is participating in the MHA programs while continuing to expand its other loss-mitigation efforts for financially distressed borrowers who do not qualify for the MHA programs. The MHA programs and the Firm's other loss-mitigation programs for financially troubled borrowers generally represent various concessions such as term extensions, rate reductions and deferral of principal payments that would have otherwise been required under the terms of the original agreement. When the Firm modifies home equity lines of credit in troubled debt restructurings, future lending commitments related to the modified loans are canceled as part of the terms of the modification. Under all of these programs, borrowers must make at least three payments under the revised contractual terms during a trial modification period and be successfully re-underwritten with income verification before their loans can be permanently modified. The Firm's loss-mitigation programs are intended to minimize economic loss to the Firm, while providing alternatives to foreclosure. The success of these programs is highly dependent on borrowers' ongoing ability and willingness to repay in accordance with the modified terms and could be adversely affected by additional deterioration in the economic environment or shifts in borrower behavior. For both the Firm's on-balance sheet loans and loans serviced for others, approximately 600,000 mortgage modifications had been offered to borrowers in 2009. Of these, 89,000 have achieved permanent modification. Substantially all of the loans contractually modified to date were modified under the Firm's other loss mitigation programs.

The following table presents information relating to restructured on-balance sheet residential real estate loans for which concessions have been granted to borrowers experiencing financial difficulty as of December 31, 2009. Modifications of purchased credit-impaired loans continue to be accounted for and reported as purchased credit-impaired loans, and the impact of the modification is incorporated into the Firm's quarterly assessment of whether a probable and/or significant change in estimated future principal cash flows has occurred. Modifications of loans other than purchased credit-impaired are generally accounted for and reported as troubled debt restructurings.

Restructured residential real estate loans[a]

December 31, 2009 (in millions)	On–balance sheet loans	Nonperforming on–balance sheet loans[d]
Restructured residential real estate loans – excluding purchased credit-impaired loans[b]		
Home equity – senior lien	$ 168	$ 30
Home equity – junior lien	222	43
Prime mortgage	634	243
Subprime mortgage	1,998	598
Option ARMs	8	6
Total restructured residential real estate loans – excluding purchased credit-impaired loans	$ 3,030	$ 920
Restructured purchased credit-impaired loans[c]		
Home equity	$ 453	NA
Prime mortgage	1,526	NA
Subprime mortgage	1,954	NA
Option ARMs	2,972	NA
Total restructured purchased credit-impaired loans	$ 6,905	NA

(a) Restructured residential real estate loans were immaterial at December 31, 2008.
(b) Amounts represent the carrying value of restructured residential real estate loans.
(c) Amounts represent the unpaid principal balance of restructured purchased credit-impaired loans.
(d) Nonperforming loans modified in a troubled debt restructuring may be returned to accrual status when repayment is reasonably assured and the borrower has made a minimum of six payments under the new terms.

Real estate owned ("REO"): As part of the residential real estate foreclosure process, loans are written down to the fair value of the underlying real estate asset, less costs to sell. In those instances where the Firm gains title, ownership and possession of individual properties at the completion of the foreclosure process, these REO assets are managed for prompt sale and disposition at the best possible economic value. Any further gains or losses on REO assets are recorded as part of other income. Operating expense, such as real estate taxes and maintenance, are charged to other expense. REO assets declined from year-end 2008 as a result of the foreclosure moratorium in early 2009 and the subsequent increase in loss mitigation activities. It is anticipated that REO assets will increase over the next several quarters, as loans moving through the foreclosure process are expected to increase.

Portfolio transfers: The Firm regularly evaluates market conditions and overall economic returns and makes an initial determination as to whether new originations will be held-for-investment or sold within the foreseeable future. The Firm also periodically evaluates the expected economic returns of previously originated loans under prevailing market conditions to determine whether their designation as held-for-sale or held-for-investment continues to be appropriate. When the Firm determines that a change in this designation is appropriate, the loans are transferred to the appropriate classification. Since the second half of 2007, all new prime mortgage originations that cannot be sold to U.S. government agencies and U.S. government-sponsored enterprises have been designated as held-for-investment. Prime mortgage loans originated with the intent to sell are accounted for at fair value and classified as trading assets in the Consolidated Balance Sheets.

ALLOWANCE FOR CREDIT LOSSES

JPMorgan Chase's allowance for loan losses covers the wholesale (risk-rated) and consumer (primarily scored) loan portfolios and represents management's estimate of probable credit losses inherent in the Firm's loan portfolio. Management also computes an allowance for wholesale lending-related commitments using a methodology similar to that used for the wholesale loans. During 2009, the Firm did not make any significant changes to the methodologies or policies described in the following paragraphs.

Wholesale loans are charged off to the allowance for loan losses when it is highly certain that a loss has been realized; this determination considers many factors, including the prioritization of the Firm's claim in bankruptcy, expectations of the workout/restructuring of the loan, and valuation of the borrower's equity. Consumer loans, other than purchased credit-impaired loans, are generally charged off to the allowance for loan losses upon reaching specified stages of delinquency, in accordance with the Federal Financial Institutions Examination Council policy. For example, credit card loans are charged off by the end of the month in which the account becomes 180 days past due or within 60 days of receiving notification about a specified event (e.g., bankruptcy of the borrower), whichever is earlier. Residential mortgage products are generally charged off to an amount equal to the net realizable value of the underlying collateral, no later than the date the loan becomes 180 days past due. Other consumer products, if collateralized, are generally charged off to the net realizable value of the underlying collateral at 120 days past due.

Determining the appropriateness of the allowance is complex and requires judgment about the effect of matters that are inherently uncertain. Assumptions about unemployment rates, housing prices and overall economic conditions could have a significant impact on the Firm's determination of loan quality. Subsequent evaluations of the loan portfolio, in light of then-prevailing factors, may result in significant changes in the allowances for loan losses and lending-related commitments in future periods. At least quarterly, the allowance for credit losses is reviewed by the Chief Risk Officer, the Chief Financial Officer and the Controller of the Firm and discussed with the Risk Policy and Audit Committees of the Board of Directors of the Firm. As of December 31, 2009, JPMorgan Chase deemed the allowance for credit losses to be appropriate (i.e., sufficient to absorb losses inherent in the portfolio, including those not yet identifiable).

For a further discussion of the components of the allowance for credit losses, see Critical Accounting Estimates Used by the Firm on pages 135–139 and Note 14 on pages 204–206 of this Annual Report.

The allowance for credit losses increased by $8.7 billion from the prior year to $32.5 billion. Excluding held-for-sale loans, loans carried at fair value, and purchased credit-impaired consumer loans, the allowance for loan losses represented 5.51% of loans at December 31, 2009, compared with 3.62% at December 31, 2008.

The consumer allowance for loan losses increased by $7.8 billion from the prior year, primarily as a result of an increased allowance for loan losses in residential real estate and credit card. The increase included additions to the allowance for loan losses of $5.2 billion, driven by higher estimated losses for residential mortgage and home equity loans as the weak labor market and weak overall economic conditions have resulted in increased delinquencies, and continued weak housing prices have driven a significant increase in loss severity. The allowance for loan losses related to credit card increased $2.0 billion from the prior year, reflecting continued weakness in the credit environment. The increase reflects an addition of $2.4 billion through the provision for loan losses, partially offset by the reclassification of $298 million related to the issuance and retention of securities from the Chase Issuance Trust.

The wholesale allowance for loan losses increased by $600 million from December 31, 2008, reflecting the effect of a continued weakening credit environment.

To provide for the risk of loss inherent in the Firm's process of extending credit an allowance for lending-related commitments is held for the Firm, which is reported in other liabilities. The allowance is computed using a methodology similar to that used for the wholesale loan portfolio, modified for expected maturities and probabilities of drawdown. For a further discussion on the allowance for lending-related commitments, see Note 14 on page 204–206 of this Annual Report.

The allowance for lending-related commitments for both wholesale and consumer, which is reported in other liabilities, was $939 million and $659 million at December 31, 2009 and 2008, respectively. The increase reflects downgrades within the wholesale portfolio due to the continued weakening credit environment during 2009.

The credit ratios in the table below are based on retained loan balances, which exclude loans held-for-sale and loans accounted for at fair value. As of December 31, 2009 and 2008, wholesale retained loans were $200.1 billion and $248.1 billion, respectively; and consumer retained loans were $427.1 billion and $480.8 billion, respectively. For the years ended December 31, 2009 and 2008, average wholesale retained loans were $223.0 billion and $219.6 billion, respectively; and average consumer retained loans were $449.2 billion and $347.4 billion, respectively.

Summary of changes in the allowance for credit losses

Year ended December 31, (in millions)	2009 Wholesale	2009 Consumer	2009 Total	2008 Wholesale	2008 Consumer	2008 Total
Allowance for loan losses:						
Beginning balance at January 1,	**$ 6,545**	**$ 16,619**	**$ 23,164**	$ 3,154	$ 6,080	$ 9,234

Total allowance for credit losses	**$ 8,072**	**$ 24,469**	**$ 32,541**	$ 7,179	$ 16,644	$ 23,823
Credit ratios:						
Allowance for loan losses to retained loans	**3.57%**	**5.73%**	**5.04%**	2.64%	3.46%	3.18%
Net charge-off rates[e]	**1.40**	**4.41**	**3.42**	0.18	2.71	1.73
Credit ratios excluding home lending purchased credit-impaired loans and loans held by the Washington Mutual Master Trust						
Allowance for loan losses to retained loans[f]	**3.57**	**6.63**	**5.51**	2.64	4.24	3.62

(a) Related to the Washington Mutual transaction in 2008.
(b) Predominantly includes a reclassification in 2009 related to the issuance and retention of securities from the Chase Issuance Trust, as well as reclassifications of allowance balances related to business transfers between wholesale and consumer businesses in the first quarter of 2008.
(c) Relates to risk-rated loans that have been placed on nonaccrual status and loans that have been modified in a troubled debt restructuring.
(d) The asset-specific consumer allowance for loan losses includes troubled debt restructuring reserves of $754 million and $258 million at December 31, 2009 and 2008, respectively. Prior period amounts have been reclassified to conform to the current presentation.
(e) Charge-offs are not recorded on purchased credit-impaired loans until actual losses exceed estimated losses that were recorded as purchase accounting adjustments at the time of acquisition.
(f) Excludes the impact of purchased credit-impaired loans that were acquired as part of the Washington Mutual transaction and loans held by the Washington Mutual Master Trust, which were consolidated onto the Firm's balance sheet at fair value during the second quarter of 2009. As of December 31, 2009, an allowance for loan losses of $1.6 billion was recorded for the purchased credit-impaired loans, which has also been excluded from applicable ratios. No allowance was recorded for the loans that were consolidated from the Washington Mutual Master Trust as of December 31, 2009. To date, no charge-offs have been recorded for any of these loans.

The following table includes a credit ratio excluding the following items: home lending purchased credit-impaired loans acquired in the Washington Mutual transaction; and credit card loans held by the Washington Mutual Master Trust, which were consolidated onto the Firm's balance sheet at fair value during the second quarter of 2009. The purchased credit-impaired loans were accounted for at fair value on the acquisition date, which incorporated management's estimate, as of that date, of credit losses over the remaining life of the portfolio. Accordingly, no allowance for loan losses was recorded for these loans as of the acquisition date. Subsequent evaluations of estimated credit deterioration in this portfolio resulted in the recording of an allowance for loan losses of $1.6 billion at December 31, 2009. For more information on home lending purchased credit-impaired loans, see pages 117 and 121 of this Annual Report. For more information on the consolidation of assets from the Washington Mutual Master Trust, see Note 15 on pages 206–213 of this Annual Report.

The calculation of the allowance for loan losses to total retained loans, excluding both home lending purchased credit-impaired loans and loans held by the Washington Mutual Master Trust, is presented below.

December 31, (in millions, except ratios)	2009	2008
Allowance for loan losses	**$ 31,602**	$ 23,164
Less: Allowance for purchased credit-impaired loans	**1,581**	—
Adjusted allowance for loan losses	**$ 30,021**	$ 23,164
Total loans retained	**$ 627,218**	$ 728,915
Less: Firmwide purchased credit-impaired loans	**81,380**	89,088
Loans held by the Washington Mutual Master Trust	**1,002**	—
Adjusted loans	**$ 544,836**	$ 639,827
Allowance for loan losses to ending loans excluding purchased credit-impaired loans and loans held by the Washington Mutual Master Trust	**5.51%**	3.62%

The following table presents the allowance for credit losses by business segment at December 31, 2009 and 2008.

	Allowance for credit losses					
	2009			2008		
December 31, (in millions)	Loan losses	Lending-related commitments	Total	Loan losses	Lending-related commitments	Total

Provision for credit losses

The managed provision for credit losses was $38.5 billion for the year ended December 31, 2009, up by $13.9 billion from the prior year. The prior-year included a $1.5 billion charge to conform Washington Mutual's allowance for loan losses, which affected both the consumer and wholesale portfolios. For the purpose of the following analysis, this charge is excluded. The consumer-managed provision for credit losses was $34.5 billion for the year ended December 31, 2009, compared with $20.4 billion in the prior year, reflecting an increase in the allowance for credit losses in the home lending and credit card loan portfolios. Included in the 2009 addition to the allowance for loan losses was a $1.6 billion increase related to estimated deterioration in the Washington Mutual purchased credit-impaired portfolio. The wholesale provision for credit losses was $4.0 billion for the year ended December 31, 2009, compared with $2.7 billion in the prior year, reflecting continued weakness in the credit environment.

Year ended December 31, (in millions)	Provision for credit losses								
	Loan losses			Lending-related commitments			Total		
	2009	2008	2007	**2009**	2008	2007	**2009**	2008	2007

Total provision for credit losses – managed	**$ 38,178**	$ 24,849	$ 8,918	**$ 280**	$ (258)	$ 326	**$ 38,458**	$ 24,591	$ 9,244

(a) Includes accounting conformity provisions related to the Washington Mutual transaction in 2008.

(b) Includes provision expense related to loans acquired in the Bear Stearns merger in the second quarter of 2008.

(c) Includes amounts related to held-for-investment prime mortgages transferred from AM to the Corporate/Private Equity segment.

(d) In November 2008, the Firm transferred $5.8 billion of higher quality credit card loans from the legacy Chase portfolio to a securitization trust previously established by Washington Mutual ("the Trust"). As a result of converting higher credit quality Chase-originated on-book receivables to the Trust's seller's interest which has a higher overall loss rate reflective of the total assets within the Trust, approximately $400 million of incremental provision expense was recorded during the fourth quarter. This incremental provision expense was recorded in the Corporate segment as the action related to the acquisition of Washington Mutual's banking operations. For further discussion of credit card securitizations, see Note 15 on pages 206–213 of this Annual Report.

MARKET RISK MANAGEMENT

Market risk is the exposure to an adverse change in the market value of portfolios and financial instruments caused by a change in market prices or rates.

Market risk management

Market Risk is an independent risk management function, aligned primarily with each of the Firm's business segments. Market Risk works in partnership with the business segments to identify and monitor market risks throughout the Firm as well as to define market risk policies and procedures. The risk management function is headed by the Firm's Chief Risk Officer.

Market Risk seeks to facilitate efficient risk/return decisions, reduce volatility in operating performance and make the Firm's market risk profile transparent to senior management, the Board of Directors and regulators. Market Risk is responsible for the following functions:

- Establishing a comprehensive market risk policy framework
- Independent measurement, monitoring and control of business segment market risk
- Definition, approval and monitoring of limits
- Performance of stress testing and qualitative risk assessments

Risk identification and classification

Each business segment is responsible for the comprehensive identification and verification of market risks within its units. The highest concentrations of market risk are found in IB, Consumer Lending, and the Firm's Chief Investment Office in the Corporate/Private Equity segment.

IB makes markets and trades its products across several different asset classes. These asset classes primarily include fixed income risk (both interest rate risk and credit spread risk), foreign exchange, equities and commodities risk. These trading risks may lead to the potential decline in net income due to adverse changes in market rates. In addition to these trading risks, there are risks in IB's credit portfolio from retained loans and commitments, derivative credit valuation adjustments, hedges of the credit valuation adjustments and mark-to-market hedges of the retained loan portfolio. Additional risk positions result from the debit valuation adjustments taken on certain structured liabilities and derivatives to reflect the credit quality of the Firm.

The Firm's Consumer Lending business unit includes the Firm's mortgage pipeline and warehouse loans, MSRs and all related hedges. These activities give rise to complex interest rate risks, as well as option and basis risk. Option risk arises primarily from prepayment options embedded in mortgages and changes in the probability of newly originated mortgage commitments actually closing. Basis risk results from differences in the relative movements of the rate indices underlying mortgage exposure and other interest rates.

The Chief Investment Office is primarily concerned with managing structural market risks which arise out of the various business activities of the Firm. These include structural interest rate risk, and foreign exchange risk. Market Risk measures and monitors the gross structural exposures as well as the net exposures related to these activities.

Risk measurement

Tools used to measure risk

Because no single measure can reflect all aspects of market risk, the Firm uses various metrics, both statistical and nonstatistical, including:

- Nonstatistical risk measures
- Value-at-risk
- Loss advisories
- Drawdowns
- Economic value stress testing
- Earnings-at-risk stress testing
- Risk identification for large exposures ("RIFLE")

Nonstatistical risk measures

Nonstatistical risk measures other than stress testing include net open positions, basis point values, option sensitivities, market values, position concentrations and position turnover. These measures provide granular information on the Firm's market risk exposure. They are aggregated by line of business and by risk type, and are used for monitoring limits, one-off approvals and tactical control.

Value-at-risk

JPMorgan Chase's primary statistical risk measure, VaR, estimates the potential loss from adverse market moves in a normal market environment and provides a consistent cross-business measure of risk profiles and levels of diversification. VaR is used for comparing risks across businesses, monitoring limits, and as an input to economic capital calculations. Each business day, as part of its risk management activities, the Firm undertakes a comprehensive VaR calculation that includes the majority of its market risks. These VaR results are reported to senior management.

To calculate VaR, the Firm uses historical simulation, based on a one-day time horizon and an expected tail-loss methodology, which measures risk across instruments and portfolios in a consistent and comparable way. The simulation is based on data for the previous 12 months. This approach assumes that historical changes in market values are representative of future changes; this assumption may not always be accurate, particularly when there is volatility in the market environment. For certain products, such as lending facilities and some mortgage-related securities for which price-based time series are not readily available, market-based data are used in conjunction with sensitivity factors to estimate the risk. It is likely that using an actual price-based time series for these products, if available, would impact the VaR results presented. In addition, certain risk parameters, such as correlation risk among certain instruments, are not fully captured in VaR.

In the third quarter of 2008, the Firm revised its reported IB Trading and credit portfolio VaR measure to include additional risk positions previously excluded from VaR, thus creating a more comprehensive view of the Firm's market risks. In addition, the Firm moved to calculating VaR using a 95% confidence level to provide a more stable measure of the VaR for day-to-day risk management. The following sections describe JPMorgan Chase's VaR measures under both the legacy 99% confidence level as well as the new 95% confidence level. The Firm intends to present VaR solely at the 95% confidence level commencing in the first quarter of 2010, as information for two complete year-to-date periods will then be available.

The table below shows the results of the Firm's VaR measure using the legacy 99% confidence level.

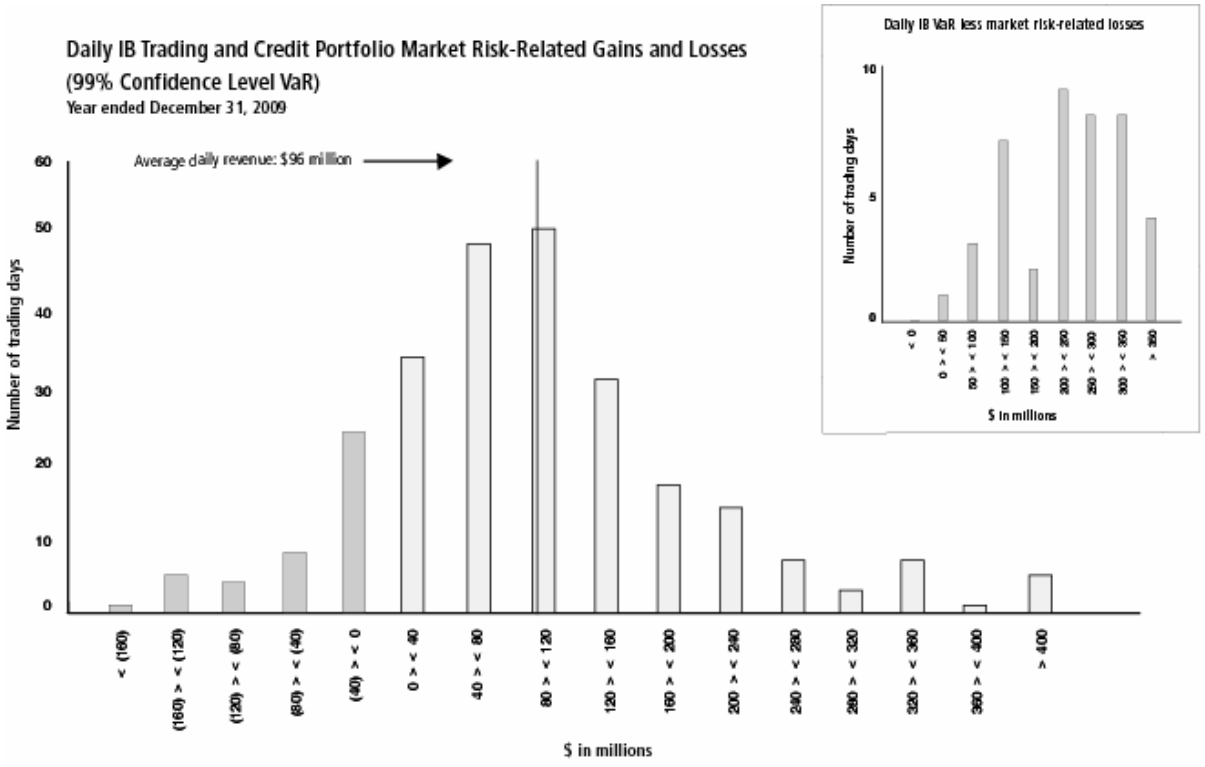
99% Confidence-Level VaR
IB trading VaR by risk type and credit portfolio VaR

As of or for the year ended	**2009**			2008			At December 31,	
December 31,[a] (in millions)	Average	Minimum	Maximum	Average	Minimum	Maximum	**2009**	2008
By risk type:								
Fixed income	**$ 221**	**$ 112**	**$ 289**	$ 181	$ 99	$ 409	**$ 123**	$ 253
Foreign exchange	**30**	**10**	**67**	34	13	90	**18**	70
Equities	**75**	**13**	**248**	57	19	187	**64**	69
Commodities and other	**32**	**16**	**58**	32	24	53	**23**	26
Diversification	**(131)**[b]	**NM**[c]	**NM**[c]	(108)[b]	NM[c]	NM[c]	**(99)**[b]	(152)[b]
Trading VaR	**$ 227**	**$ 103**	**$ 357**	$ 196	$ 96	$ 420	**$ 129**	$ 266
Credit portfolio VaR	**101**	**30**	**221**	69	20	218	**37**	171
Diversification	**(80)**[b]	**NM**[c]	**NM**[c]	(63)[b]	NM[c]	NM[c]	**(20)**[b]	(120)[b]
Total trading and credit portfolio VaR	**$ 248**	**$ 132**	**$ 397**	$ 202	$ 96	$ 449	**$ 146**	$ 317

(a) The results for the year ended December 31, 2008, include five months of heritage JPMorgan Chase & Co. only results and seven months of combined JPMorgan Chase & Co. and Bear Stearns results.
(b) Average and period-end VaRs were less than the sum of the VaRs of its market risk components, which is due to risk offsets resulting from portfolio diversification. The diversification effect reflects the fact that the risks were not perfectly correlated. The risk of a portfolio of positions is therefore usually less than the sum of the risks of the positions themselves.
(c) Designated as not meaningful ("NM") because the minimum and maximum may occur on different days for different risk components, and hence it is not meaningful to compute a portfolio diversification effect.

The 99% confidence level trading VaR includes substantially all trading activities in IB. Beginning in the fourth quarter of 2008, the credit spread sensitivities of certain mortgage products were included in trading VaR. This change had an insignificant impact on the average fourth quarter VaR. For certain other products included in the trading VaR, particular risk parameters are not fully captured – for example, correlation risk. Trading VaR does not include: held-for-sale funded loan and unfunded commitments positions (however, it does include hedges of those positions); the DVA taken on derivative and structured liabilities to reflect the credit quality of the Firm; the MSR portfolio; and securities and instruments held by other corporate functions, such as Private Equity. See the DVA Sensitivity table on page 130 of this Annual Report for further details. For a discussion of MSRs and the corporate functions, see Note 3 on pages 156–173, Note 17 on pages 222–225 and Corporate/ Private Equity on pages 82–83 of this Annual Report.

2009 VaR results (99% confidence level VaR)



IB's average total trading and credit portfolio VaR was $248 million for 2009, compared with $202 million for 2008, primarily driven by market volatility. Volatility began to significantly increase across all asset classes from late 2008 and persisted through the first quarter of 2009. From the second quarter of 2009 onwards, volatility in the markets gradually declined; however, the impact of the volatile periods was still reflected in the 2009 VaR numbers.

Spot total trading and credit portfolio VaR as of December 31, 2009, was $146 million, compared with $317 million as of December 31, 2008. The decrease in the spot VaR in 2009 reflects the reduction in overall risk levels as well as the aforementioned decline in market volatility by the end of 2009 when compared to the end of 2008.

For 2009, compared with the prior year, average trading VaR diversification increased to $131 million, or 37% of the sum of the components, from $108 million, or 36% of the sum of the components in the prior year. In general, over the course of the year, VaR exposures can vary significantly as positions change, market volatility fluctuates and diversification benefits change.

VaR backtesting (99% confidence level VaR)

To evaluate the soundness of its VaR model, the Firm conducts daily back-testing of VaR against daily IB market risk–related revenue, which is defined as the change in value of principal transactions revenue (excluding private equity gains/(losses)) plus any trading-related net interest income, brokerage commissions, underwriting fees or other revenue. The daily IB market risk–related revenue excludes gains and losses on held-for-sale funded loans and unfunded commitments and from DVA. The following histogram illustrates the daily market risk–related gains and losses for IB trading businesses for the year ended 2009. The chart shows that IB posted market risk–related gains on 219 out of 261 days in this period, with 54 days exceeding $160 million. The inset graph looks at those days on which IB experienced losses and depicts the amount by which 99% confidence level VaR exceeded the actual loss on each of those days. Losses were sustained on 42 days during the year ended December 31, 2009, with no loss exceeding the VaR measure. The Firm would expect to incur losses greater than that predicted by VaR estimates once in every 100 trading days, or about two to three times a year.

The table below shows the results of the Firm's VaR measure using a 95% confidence level.

95% Confidence Level VaR
Total IB trading VaR by risk type, credit portfolio VaR and other VaR

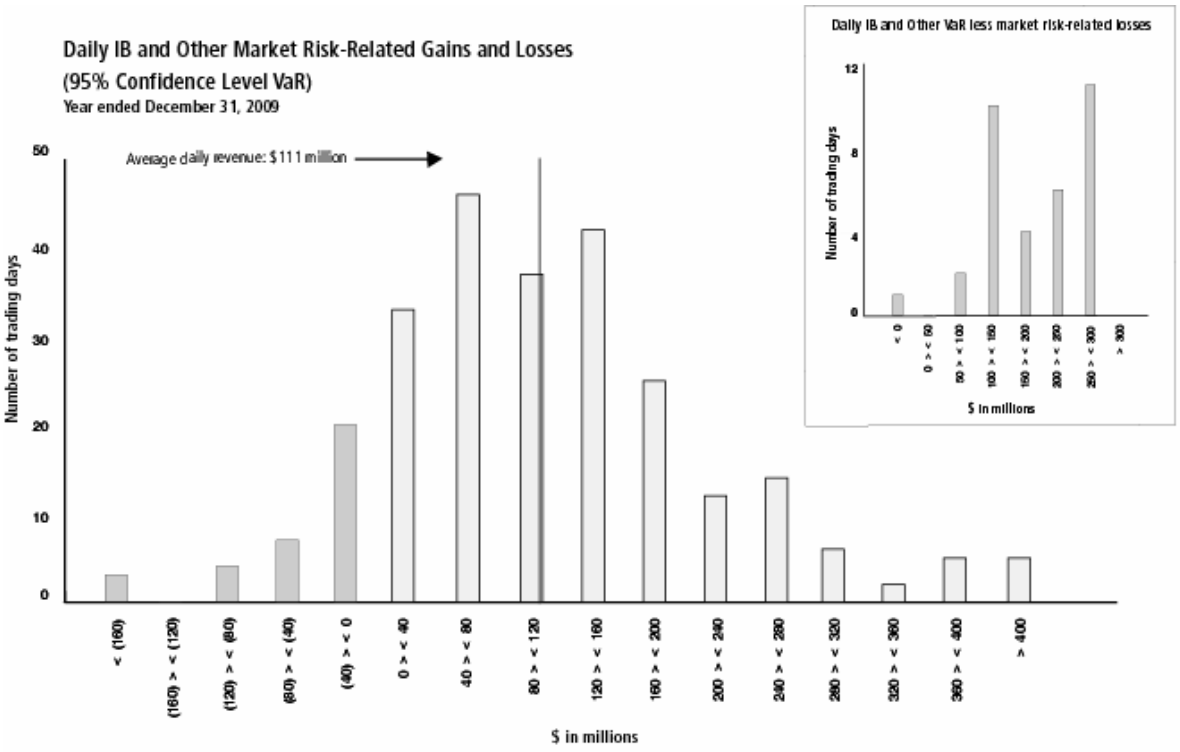
(a) Results for the year ended December 31, 2008, are not available.

VaR measurement

The Firm's 95% VaR measure above includes all the risk positions taken into account under the 99% confidence level VaR measure, as well as syndicated lending facilities that the Firm intends to distribute. The Firm utilizes proxies to estimate the VaR for these products since daily time series are largely not available. In addition, the 95% VaR measure also includes certain positions utilized as part of the Firm's risk management function within the Chief Investment Office ("CIO") and in the Consumer Lending businesses to provide a Total IB and other VaR measure. The CIO VaR includes positions, primarily in debt securities and credit products, used to manage structural risk and other risks, including interest rate, credit and mortgage risks arising from the Firm's ongoing business activities. The Consumer Lending VaR includes the Firm's mortgage pipeline and warehouse loans, MSRs and all related hedges. In the Firm's view, including these items in VaR produces a more complete perspective of the Firm's market risk profile.

The 95% VaR measure continues to exclude the DVA taken on certain structured liabilities and derivatives to reflect the credit quality of the Firm. It also excludes certain activities such as Private Equity, principal investing (e.g., mezzanine financing, tax-oriented investments, etc.) and balance sheet, capital management positions and longer-term investments managed by the CIO. These longer-term positions are managed through the Firm's earnings-at-risk and other cash flow–monitoring processes rather than by using a VaR measure. Principal investing activities and Private Equity positions are managed using stress and scenario analysis.



2009 VaR results (95% confidence level VaR)

Spot IB and other VaR as of December 31, 2009, was $123 million, compared with $286 million as of December 31, 2008. The decrease in spot VaR in 2009 is a consequence of reductions in overall risk as well as declining market volatility. In general, over the course of the year, VaR exposures can vary significantly as positions change, market volatility fluctuates and diversification benefits change.

VaR backtesting (95% confidence level VaR)

To evaluate the soundness of its VaR model, the Firm conducts daily back-testing of VaR against the Firm's market risk–related revenue, which is defined as follows: the change in value of principal transactions revenue for IB and CIO (excluding private equity gains/(losses) and revenue from longer-term CIO investments); trading-related net interest income for IB, RFS and CIO (excluding longer-term CIO investments); IB brokerage commissions, underwriting fees or other revenue; revenue from syndicated lending facilities that the Firm intends to distribute; and mortgage fees and related income for the Firm's mortgage pipeline and warehouse loans, MSRs and all related hedges. The daily firmwide market risk–related revenue excludes gains and losses from DVA.

The following histogram illustrates the daily market risk–related gains and losses for IB and Consumer/CIO positions for 2009. The chart shows that the Firm posted market risk–related gains on 227 out of 261 days in this period, with 69 days exceeding $160 million. The inset graph looks at those days on which the Firm experienced losses and depicts the amount by which the 95% confidence level VaR exceeded the actual loss on each of those days. Losses were sustained on 34 days during 2009 and exceeded the VaR measure on one day due to high market volatility in the first quarter of 2009. Under the 95% confidence interval, the Firm would expect to incur daily losses greater than that predicted by VaR estimates about twelve times a year.

The following table provides information about the gross sensitivity of DVA to a one-basis-point increase in JPMorgan Chase's credit spreads. This sensitivity represents the impact from a one-basis-point parallel shift in JPMorgan Chase's entire credit curve. As credit curves do not typically move in a parallel fashion, the sensitivity multiplied by the change in spreads at a single maturity point may not be representative of the actual revenue recognized.

Debit valuation adjustment sensitivity

(in millions)	1 Basis Point Increase in JPMorgan Chase Credit Spread
December 31, 2009	**$ 39**
December 31, 2008	$ 37

Loss advisories and drawdowns

Loss advisories and drawdowns are tools used to highlight to senior management trading losses above certain levels and initiate discussion of remedies.

Economic value stress testing

While VaR reflects the risk of loss due to adverse changes in normal markets, stress testing captures the Firm's exposure to unlikely but plausible events in abnormal markets. The Firm conducts economic-value stress tests using multiple scenarios that assume credit spreads widen significantly, equity prices decline and significant changes in interest rates across the major currencies. Other scenarios focus on the risks predominant in individual business segments and include scenarios that focus on the potential for adverse movements in complex portfolios. Scenarios were updated more frequently in 2009 and, in some cases, redefined to reflect the significant market volatility which began in late 2008. Along with VaR, stress testing is important in measuring and controlling risk. Stress testing enhances the understanding of the Firm's risk profile and loss potential, and stress losses are monitored against limits. Stress testing is also utilized in one-off approvals and cross-business risk measurement, as well as an input to economic capital allocation. Stress-test results, trends and explanations based on current market risk positions are reported to the Firm's senior management and to the lines of business to help them better measure and manage risks and to understand event risk–sensitive positions.

Earnings-at-risk stress testing

The VaR and stress-test measures described above illustrate the total economic sensitivity of the Firm's Consolidated Balance Sheets to changes in market variables. The effect of interest rate exposure on reported net income is also important. Interest rate risk exposure in the Firm's core nontrading business activities (i.e., asset/liability management positions) results from on–and off–balance sheet positions and can occur due to a variety of factors, including:

- Differences in the timing among the maturity or repricing of assets, liabilities and off–balance sheet instruments. For example, if liabilities reprice quicker than assets and funding interest rates are declining, earnings will increase initially.
- Differences in the amounts of assets, liabilities and off–balance sheet instruments that are repricing at the same time. For example, if more deposit liabilities are repricing than assets when general interest rates are declining, earnings will increase initially.
- Differences in the amounts by which short-term and long-term market interest rates change (for example, changes in the slope of the yield curve, because the Firm has the ability to lend at long-term fixed rates and borrow at variable or short-term fixed rates). Based on these scenarios, the Firm's earnings would be affected negatively by a sudden and unanticipated increase in short-term rates paid on its liabilities (e.g., deposits) without a corresponding increase in long-term rates received on its assets (e.g., loans). Conversely, higher long-term rates received on assets generally are beneficial to earnings, particularly when the increase is not accompanied by rising short-term rates paid on liabilities.
- The impact of changes in the maturity of various assets, liabilities or off–balance sheet instruments as interest rates change. For example, if more borrowers than forecasted pay down higher-rate loan balances when general interest rates are declining, earnings may decrease initially.

The Firm manages interest rate exposure related to its assets and liabilities on a consolidated, corporate-wide basis. Business units transfer their interest rate risk to Treasury through a transfer-pricing system, which takes into account the elements of interest rate exposure that can be risk-managed in financial markets. These elements include asset and liability balances and contractual rates of interest, contractual principal payment schedules, expected prepayment experience, interest rate reset dates and maturities, rate indices used for repricing, and any interest rate ceilings or floors for adjustable rate products. All transfer-pricing assumptions are dynamically reviewed.

The Firm conducts simulations of changes in net interest income from its nontrading activities under a variety of interest rate scenarios. Earnings-at-risk tests measure the potential change in the Firm's net interest income, and the corresponding impact to the Firm's pretax earnings, over the following 12 months. These tests highlight exposures to various rate-sensitive factors, such as the rates themselves (e.g., the prime lending rate), pricing strategies on deposits, optionality and changes in product mix. The tests include forecasted balance sheet changes, such as asset sales and securitizations, as well as prepayment and reinvestment behavior.

Immediate changes in interest rates present a limited view of risk, and so a number of alternative scenarios are also reviewed. These scenarios include the implied forward curve, nonparallel rate shifts and severe interest rate shocks on selected key rates. These scenarios are intended to provide a comprehensive view of JPMorgan Chase's earnings at risk over a wide range of outcomes.

JPMorgan Chase's 12-month pretax earnings sensitivity profile as of December 31, 2009 and 2008, is as follows.

	Immediate change in rates			
(in millions)	+200bp	+100bp	-100bp	-200bp
December 31, 2009	**$ (1,594)**	**$ (554)**	**NM**[a]	**NM**[a]
December 31, 2008	$ 336	$ 672	NM[a]	NM[a]

(a) Down 100- and 200-basis-point parallel shocks result in a Fed Funds target rate of zero, and negative three- and six-month Treasury rates. The earnings-at-risk results of such a low-probability scenario are not meaningful.

The change in earnings at risk from December 31, 2008, results from a higher level of AFS securities and an updated baseline scenario that uses higher short-term interest rates. The Firm's risk to rising rates is largely the result of increased funding costs on assets, partially offset by widening deposit margins, which are currently compressed due to very low short-term interest rates.

Additionally, another interest rate scenario, involving a steeper yield curve with long-term rates rising 100 basis points and short-term rates staying at current levels, results in a 12-month pretax earnings benefit of $449 million. The increase in earnings is due to reinvestment of maturing assets at the higher long-term rates, with funding costs remaining unchanged.

Risk identification for large exposures

Individuals who manage risk positions, particularly those that are complex, are responsible for identifying potential losses that could arise from specific, unusual events, such as a potential tax change, and estimating the probabilities of losses arising from such events. This information is entered into the Firm's RIFLE database. Management of trading businesses control RIFLE entries, thereby permitting the Firm to monitor further earnings vulnerability not adequately covered by standard risk measures.

Risk monitoring and control

Limits

Market risk is controlled primarily through a series of limits. Limits reflect the Firm's risk appetite in the context of the market environment and business strategy. In setting limits, the Firm takes into consideration factors such as market volatility, product liquidity, business trends and management experience.

Market risk management regularly reviews and updates risk limits. Senior management, including the Firm's Chief Executive Officer and Chief Risk Officer, is responsible for reviewing and approving risk limits on an ongoing basis.

The Firm maintains different levels of limits. Corporate-level limits include VaR and stress limits. Similarly, line-of-business limits include VaR and stress limits and may be supplemented by loss advisories, nonstatistical measurements and instrument authorities. Businesses are responsible for adhering to established limits, against which exposures are monitored and reported. Limit breaches are reported in a timely manner to senior management, and the affected business segment is required to reduce trading positions or consult with senior management on the appropriate action.

Qualitative review

The Market Risk Management group also performs periodic reviews as necessary of both businesses and products with exposure to market risk to assess the ability of the businesses to control their market risk. Strategies, market conditions, product details and risk controls are reviewed and specific recommendations for improvements are made to management.

Model review

Some of the Firm's financial instruments cannot be valued based on quoted market prices but are instead valued using pricing models. Such models are used for management of risk positions, such as reporting against limits, as well as for valuation. The Model Risk Group, which is independent of the businesses and market risk management, reviews the models the Firm uses and assesses model appropriateness and consistency. The model reviews consider a number of factors about the model's suitability for valuation and risk management of a particular product, including whether it accurately reflects the characteristics of the transaction and its significant risks, the suitability and convergence properties of numerical algorithms, reliability of data sources, consistency of the treatment with models for similar products, and sensitivity to input parameters and assumptions that cannot be priced from the market.

Reviews are conducted of new or changed models, as well as previously accepted models, to assess whether there have been any changes in the product or market that may impact the model's validity and whether there are theoretical or competitive developments that may require reassessment of the model's adequacy. For a summary of valuations based on models, see Critical Accounting Estimates Used by the Firm on pages 135–139 of this Annual Report.

Risk reporting

Nonstatistical exposures, value-at-risk, loss advisories and limit excesses are reported daily to senior management. Market risk exposure trends, value-at-risk trends, profit-and-loss changes and portfolio concentrations are reported weekly. Stress-test results are reported at least every two weeks to the businesses and senior management.

PRIVATE EQUITY RISK MANAGEMENT

Risk management

The Firm makes principal investments in private equity. The illiquid nature and long-term holding period associated with these investments differentiates private equity risk from the risk of positions held in the trading portfolios. The Firm's approach to managing private equity risk is consistent with the Firm's general risk governance structure. Controls are in place establishing expected levels for total and annual investment in order to control the overall size of the portfolio. Industry and geographic concentration limits are in place and intended to ensure diversification of the portfolio. All investments are approved by an investment committee that includes executives who are not part of the investing businesses. An independent valuation function is responsible for reviewing the appropriateness of the carrying values of private equity investments in accordance with relevant accounting policies. At December 31, 2009 and 2008, the carrying value of the Private Equity portfolio was $7.3 billion and $6.9 billion, respectively, of which $762 million and $483 million, respectively, represented publicly-traded positions. For further information on the Private Equity portfolio, see page 83 of this Annual Report.

OPERATIONAL RISK MANAGEMENT

Operational risk is the risk of loss resulting from inadequate or failed processes or systems, human factors or external events.

Overview

Operational risk is inherent in each of the Firm's businesses and support activities. Operational risk can manifest itself in various ways, including errors, fraudulent acts, business interruptions, inappropriate behavior of employees, or vendors that do not perform in accordance with their arrangements. These events could result in financial losses and other damage to the Firm, including reputational harm.

To monitor and control operational risk, the Firm maintains a system of comprehensive policies and a control framework designed to provide a sound and well-controlled operational environment. The goal is to keep operational risk at appropriate levels, in light of the Firm's financial strength, the characteristics of its businesses, the markets in which it operates, and the competitive and regulatory environment to which it is subject. Notwithstanding these control measures, the Firm incurs operational losses.

The Firm's approach to operational risk management is intended to mitigate such losses by supplementing traditional control-based approaches to operational risk with risk measures, tools and disciplines that are risk-specific, consistently applied and utilized firmwide. Key themes are transparency of information, escalation of key issues and accountability for issue resolution.

One of the ways operational risk is mitigated is through insurance maintained by the Firm. The Firm purchases insurance to be in compliance with local laws and regulations, as well as to serve other needs of the Firm. Insurance may also be required by third parties with whom the Firm does business. The insurance purchased is reviewed and approved by senior management.

The Firm's operational risk framework is supported by Phoenix, an internally designed operational risk software tool. Phoenix integrates the individual components of the operational risk management framework into a unified, web-based tool. Phoenix enhances the capture, reporting and analysis of operational risk data by enabling risk identification, measurement, monitoring, reporting and analysis to be done in an integrated manner, thereby enabling efficiencies in the Firm's monitoring and management of its operational risk.

For purposes of identification, monitoring, reporting and analysis, the Firm categorizes operational risk events as follows:

- Client service and selection
- Business practices
- Fraud, theft and malice
- Execution, delivery and process management
- Employee disputes
- Disasters and public safety
- Technology and infrastructure failures

Risk identification

Risk identification is the recognition of the operational risk events that management believes may give rise to operational losses. All businesses utilize the Firm's standard self-assessment process and supporting architecture as a dynamic risk management tool. The goal of the self-assessment process is for each business to identify the key operational risks specific to its environment and assess the degree to which it maintains appropriate controls. Action plans are developed for control issues identified, and businesses are held accountable for tracking and resolving these issues on a timely basis.

Risk measurement

Operational risk is measured for each business on the basis of historical loss experience using a statistically based loss-distribution approach. The current business environment, potential stress scenarios and measures of the control environment are then factored into the statistical measure in determining the Firmwide operational risk capital. This methodology is designed to comply with the advanced measurement rules under the new Basel II Framework.

Risk monitoring

The Firm has a process for monitoring operational risk-event data, permitting analysis of errors and losses as well as trends. Such analysis, performed both at a line-of-business level and by risk-event type, enables identification of the causes associated with risk events faced by the businesses. Where available, the internal data can be supplemented with external data for comparative analysis with industry patterns. The data reported enables the Firm to back-test against self-assessment results. The Firm is a founding member of the Operational Riskdata eXchange Association, a not-for-profit industry association formed for the purpose of collecting operational loss data, sharing data in an anonymous form and benchmarking results back to members. Such information supplements the Firm's ongoing operational risk measurement and analysis.

Risk reporting and analysis

Operational risk management reports provide timely and accurate information, including information about actual operational loss levels and self-assessment results, to the lines of business and senior management. The purpose of these reports is to enable management to maintain operational risk at appropriate levels within each line of business, to escalate issues and to provide consistent data aggregation across the Firm's businesses and support areas.

Audit alignment

Internal Audit utilizes a risk-based program of audit coverage to provide an independent assessment of the design and effectiveness of key controls over the Firm's operations, regulatory compliance and reporting. This includes reviewing the operational risk framework, the effectiveness and accuracy of the business self-assessment process and the loss data-collection and reporting activities.

REPUTATION AND FIDUCIARY RISK MANAGEMENT

A firm's success depends not only on its prudent management of the liquidity, credit, market and operational risks that are part of its business risks, but equally on the maintenance among many constituents – clients, investors, regulators, as well as the general public – of a reputation for business practices of the highest quality. Attention to reputation always has been a key aspect of the Firm's practices, and maintenance of the Firm's reputation is the responsibility of everyone at the Firm. JPMorgan Chase bolsters this individual responsibility in many ways, including through the Firm's Code of Conduct, training, maintaining adherence to policies and procedures, and oversight functions that approve transactions. These oversight functions include line-of-businesses risk committees, a Conflicts Office, which examines wholesale transactions with the potential to create conflicts of interest for the Firm; and a Reputation Risk Office and regional Reputation Risk Committees, which review certain transactions that have the potential to affect adversely the Firm's reputation. These regional committees, whose members are senior representatives of businesses and control functions in the region, focus among other things on complex derivatives and structured finance transactions with clients with the goal that these transactions not be used to mislead the client's investors or others.

Fiduciary risk management

The risk management committees within each line of business include in their mandate oversight of the legal, reputational and, where appropriate, fiduciary risks in their businesses that may produce significant losses or reputational damage. The Fiduciary Risk Management function works with the relevant line-of-business risk committees, with the goal of ensuring that businesses providing investment or risk management products or services that give rise to fiduciary duties to clients perform at the appropriate standard relative to their fiduciary relationship with a client. Of particular focus are the policies and practices that address a business' responsibilities to a client, including client suitability determination; disclosure obligations and communications; and performance expectations with respect to risk management products or services being provided. In this way, the relevant line-of-business risk committees, together with the Fiduciary Risk Management function, provide oversight of the Firm's efforts to monitor, measure and control the risks that may arise in the delivery of products or services to clients that give rise to such fiduciary duties, as well as those stemming from any of the Firm's fiduciary responsibilities to employees under the Firm's various employee benefit plans.

CRITICAL ACCOUNTING ESTIMATES USED BY THE FIRM

JPMorgan Chase's accounting policies and use of estimates are integral to understanding its reported results. The Firm's most complex accounting estimates require management's judgment to ascertain the value of assets and liabilities. The Firm has established detailed policies and control procedures intended to ensure that valuation methods, including any judgments made as part of such methods, are well-controlled, independently reviewed and applied consistently from period to period. In addition, the policies and procedures are intended to ensure that the process for changing methodologies occurs in an appropriate manner. The Firm believes its estimates for determining the value of its assets and liabilities are appropriate. The following is a brief description of the Firm's critical accounting estimates involving significant valuation judgments.

Allowance for credit losses

JPMorgan Chase's allowance for credit losses covers the retained wholesale and consumer loan portfolios, as well as the Firm's portfolio of wholesale and consumer lending-related commitments. The allowance for loan losses is intended to adjust the value of the Firm's loan assets to reflect probable credit losses as of the balance sheet date. For a further discussion of the methodologies used in establishing the Firm's allowance for credit losses, see Note 14 on pages 204–206 of this Annual Report.

Wholesale loans and lending-related commitments

The methodology for calculating the allowance for loan losses and the allowance for lending-related commitments involves significant judgment. First and foremost, it involves the early identification of credits that are deteriorating. Second, it involves judgment in establishing the inputs used to estimate the allowances. Third, it involves management judgment to evaluate certain macroeconomic factors, underwriting standards, and other relevant internal and external factors affecting the credit quality of the current portfolio, and to refine loss factors to better reflect these conditions.

The Firm uses a risk-rating system to determine the credit quality of its wholesale loans. Wholesale loans are reviewed for information affecting the obligor's ability to fulfill its obligations. In assessing the risk rating of a particular loan, among the factors considered are the obligor's debt capacity and financial flexibility, the level of the obligor's earnings, the amount and sources for repayment, the level and nature of contingencies, management strength, and the industry and geography in which the obligor operates. These factors are based on an evaluation of historical and current information and involve subjective assessment and interpretation. Emphasizing one factor over another or considering additional factors could affect the risk rating assigned by the Firm to that loan.

The Firm applies its judgment to establish loss factors used in calculating the allowances. Wherever possible, the Firm uses independent, verifiable data or the Firm's own historical loss experience in its models for estimating the allowances. Many factors can affect estimates of loss, including volatility of loss given default, probability of default and rating migrations. Consideration is given as to whether the loss estimates should be calculated as an average over the entire credit cycle or at a particular point in the credit cycle, as well as to which external data should be used and when they should be used. Choosing data that are not reflective of the Firm's specific loan portfolio characteristics could also affect loss estimates. The application of different inputs would change the amount of the allowance for credit losses determined appropriate by the Firm.

Management also applies its judgment to adjust the loss factors derived, taking into consideration model imprecision, external factors and economic events that have occurred but are not yet reflected in the loss factors. Historical experience of both loss given default and probability of default are considered when estimating these adjustments. Factors related to concentrated and deteriorating industries also are incorporated where relevant. These estimates are based on management's view of uncertainties that relate to current macroeconomic and political conditions, quality of underwriting standards and other relevant internal and external factors affecting the credit quality of the current portfolio.

As noted above, the Firm's wholesale allowance is sensitive to the risk rating assigned to a loan. As of December 31, 2009, assuming a one-notch downgrade in the Firm's internal risk ratings for its entire wholesale portfolio, the allowance for loan losses for the wholesale portfolio would increase by approximately $1.8 billion. This sensitivity analysis is hypothetical. In the Firm's view, the likelihood of a one-notch downgrade for all wholesale loans within a short timeframe is remote. The purpose of this analysis is to provide an indication of the impact of risk ratings on the estimate of the allowance for loan losses for wholesale loans. It is not intended to imply management's expectation of future deterioration in risk ratings. Given the process the Firm follows in determining the risk ratings of its loans, management believes the risk ratings currently assigned to wholesale loans are appropriate.

Consumer loans and lending-related commitments

The allowance for credit losses for the consumer portfolio is sensitive to changes in the economic environment, delinquency status, FICO scores, the realizable value of collateral, borrower behavior and other risk factors, and it is intended to represent management's best estimate of incurred losses as of the balance sheet date. The credit performance of the consumer portfolio across the entire consumer credit product spectrum continues to be negatively affected by the economic environment, as the weak labor market and overall economic conditions have resulted in increased delinquencies, while continued weak housing prices have driven a significant increase in loss severity. Significant judgment is required to estimate the duration and severity of the current economic downturn, as well as its potential impact on housing prices and the labor market. While the allowance for credit losses is highly sensitive to both home prices and unemployment rates, in the current market it is difficult to estimate how potential changes in one or both of these factors might affect

the allowance for credit losses. For example, while both factors are important determinants of overall allowance levels, changes in one factor or the other may not occur at the same rate, or changes may be directionally inconsistent such that improvement in one factor may offset deterioration in the other. In addition, changes in these factors would not necessarily be consistent across geographies or product types. Finally, it is difficult to predict the extent to which changes in both or either of these factors would ultimately affect the frequency of losses, the severity of losses or both; and overall loss rates are a function of both the frequency and severity of individual loan losses.

The allowance is calculated by applying statistical loss factors and other risk indicators to pools of loans with similar risk characteristics to arrive at an estimate of incurred losses in the portfolio. Management applies judgment to the statistical loss estimates for each loan portfolio category using delinquency trends and other risk characteristics to estimate charge-offs. Management uses additional statistical methods and considers portfolio and collateral valuation trends to review the appropriateness of the primary statistical loss estimate. The statistical calculation is adjusted to take into consideration model imprecision, external factors and current economic events that have occurred but are not yet reflected in the factors used to derive the statistical calculation, and is accomplished in part by analyzing the historical loss experience for each major product segment. In the current economic environment, it is difficult to predict whether historical loss experience is indicative of future loss levels. Management applies judgment in determining this adjustment, taking into account the uncertainties associated with current macroeconomic and political conditions, quality of underwriting standards, and other relevant internal and external factors affecting the credit quality of the portfolio.

Fair value of financial instruments, MSRs and commodities inventory

JPMorgan Chase carries a portion of its assets and liabilities at fair value. The majority of such assets and liabilities are carried at fair value on a recurring basis. Certain assets and liabilities are carried at fair value on a nonrecurring basis, including loans accounted for at the lower of cost or fair value that are only subject to fair value adjustments under certain circumstances.

Under U.S. GAAP there is a three-level valuation hierarchy for disclosure of fair value measurements. An instrument's categorization within the hierarchy is based on the lowest level of input that is significant to the fair value measurement. Therefore, for instruments classified in levels 1 and 2 of the hierarchy, where inputs are principally based on observable market data, there is less judgment applied in arriving at a fair value measurement. For instruments classified within level 3 of the hierarchy, judgments are more significant. The Firm reviews and updates the fair value hierarchy classifications on a quarterly basis. Changes from one quarter to the next related to the observability of inputs to a fair value measurement may result in a reclassification between hierarchy levels.

Assets carried at fair value

The following table includes the Firm's assets measured at fair value and the portion of such assets that are classified within level 3 of the valuation hierarchy.

December 31,	2009		2008	
(in billions, except ratio data)	Total at fair value	Level 3 total	Total at fair value	Level 3 total
Trading debt and equity securities[a]	**$ 330.9**	**$ 35.2**	$ 347.4	$ 41.4
Derivative receivables – gross	**1,565.5**	**46.7**	2,741.7	53.0
Netting adjustment	**(1,485.3)**	**—**	(2,579.1)	—
Derivative receivables – net	**80.2**	**46.7**[d]	162.6	53.0[d]
Available-for-sale securities	**360.4**	**13.2**	205.9	12.4
Loans	**1.4**	**1.0**	7.7	2.7
MSRs	**15.5**	**15.5**	9.4	9.4
Private equity investments	**7.3**	**6.6**	6.9	6.4
Other[b]	**44.4**	**9.5**	49.6	8.1
Total assets measured at fair value on a recurring basis	**840.1**	**127.7**	789.5	133.4
Total assets measured at fair value on a nonrecurring basis[c]	**8.2**	**2.7**	11.0	4.3
Total assets measured at fair value	**$ 848.3**	**$ 130.4**[e]	$ 800.5	$ 137.7[e]
Less: level 3 assets for which the Firm does not bear economic exposure		**2.1**		21.2
Total level 3 assets for which the Firm bears economic exposure		**$ 128.3**		$ 116.5
Total Firm assets	**$ 2,032.0**		$ 2,175.1	
Level 3 assets as a percentage of total Firm assets		**6%**		6%
Level 3 assets for which the Firm bears economic exposure as a percentage of total Firm assets		**6**		5
Level 3 assets as a percentage of total Firm assets at fair value		**15**		17
Level 3 assets for which the Firm bears economic exposure as a percentage of total assets at fair value		**15**		15

(a) Includes physical commodities carried at the lower of cost or fair value.
(b) Includes certain securities purchased under resale agreements, securities borrowed, accrued interest receivable and other investments.
(c) Predominantly includes delinquent mortgage and home equity loans, where impairment is based on the fair value of the underlying collateral, and leveraged lending loans carried on the Consolidated Balance Sheets at the lower of cost or fair value.

(d) Derivative receivable and derivative payable balances are presented net on the Consolidated Balance Sheets where there is a legally enforceable master netting agreement in place with counterparties. For purposes of the table above, the Firm does not reduce derivative receivable and derivative payable balances for netting adjustments, either within or across the levels of the fair value hierarchy, as such an adjustment is not relevant to a presentation that is based on the transparency of inputs to the valuation of an asset or liability. Therefore, the derivative balances reported in the fair value hierarchy levels are gross of any netting adjustments. However, if the Firm were to net such balances, the reduction in the level 3 derivative receivable and derivative payable balances would be $16.0 billion at December 31, 2009.

(e) Included in the table above are, at December 31, 2009 and 2008, $80.0 billion and $95.1 billion, respectively, of level 3 assets, consisting of recurring and nonrecurring assets carried by IB. This includes $2.1 billion and $21.2 billion, respectively, of assets for which the Firm serves as an intermediary between two parties and does not bear economic exposure.

Valuation

The Firm has an established and well-documented process for determining fair value. Fair value is based on quoted market prices, where available. If listed prices or quotes are not available, fair value is based on internally developed models that primarily use as inputs market-based or independently sourced market parameters. The Firm's process is intended to ensure that all applicable inputs are appropriately calibrated to market data, including but not limited to yield curves, interest rates, volatilities, equity or debt prices, foreign exchange rates and credit curves. In addition to market information, models also incorporate transaction details, such as maturity. Valuation adjustments may be made to ensure that financial instruments are recorded at fair value. These adjustments include amounts to reflect counterparty credit quality, the Firm's creditworthiness, constraints on liquidity and unobservable parameters that are applied consistently over time.

For instruments classified within level 3 of the hierarchy, judgments used to estimate fair value may be significant. In arriving at an estimate of fair value for an instrument within level 3, management must first determine the appropriate model to use. Second, due to the lack of observability of significant inputs, management must assess all relevant empirical data in deriving valuation inputs – including, but not limited to, yield curves, interest rates, volatilities, equity or debt prices, foreign exchange rates and credit curves. In addition to market information, models also incorporate transaction details, such as maturity. Finally, management judgment must be applied to assess the appropriate level of valuation adjustments to reflect counterparty credit quality, the Firm's creditworthiness, constraints on liquidity and unobservable parameters, where relevant. The judgments made are typically affected by the type of product and its specific contractual terms, and the level of liquidity for the product or within the market as a whole. The Firm has numerous controls in place to ensure that its valuations are appropriate. An independent model review group reviews the Firm's valuation models and approves them for use for specific products. All valuation models of the Firm are subject to this review process. A price verification group, independent from the risk-taking functions, ensures observable market prices and market-based parameters are used for valuation whenever possible. For those products with material parameter risk for which observable market levels do not exist, an independent review of the assumptions made on pricing is performed. Additional review includes deconstruction of the model valuations for certain structured instruments into their components; benchmarking valuations, where possible, to similar products; validating valuation estimates through actual cash settlement; and detailed review and explanation of recorded gains and losses, which are analyzed daily and over time. Valuation adjustments, which are also determined by the independent price verification group, are based on established policies and applied consistently over time. Any changes to the valuation methodology are reviewed by management to confirm the changes are justified. As markets and products develop and the pricing for certain products becomes more transparent, the Firm continues to refine its valuation methodologies. During 2009, no changes were made to the Firm's valuation models that had, or are expected to have, a material impact on the Firm's Consolidated Balance Sheets or results of operations.

Imprecision in estimating unobservable market inputs can affect the amount of revenue or loss recorded for a particular position. Furthermore, while the Firm believes its valuation methods are appropriate and consistent with those of other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different estimate of fair value at the reporting date. For a detailed discussion of the determination of fair value for individual financial instruments, see Note 3 on pages 156–173 of this Annual Report. In addition, for a further discussion of the significant judgments and estimates involved in the determination of the Firm's mortgage-related exposures, see "Mortgage-related exposures carried at fair value" in Note 3 on pages 169–170 of this Annual Report.

Purchased credit-impaired loans

In connection with the Washington Mutual transaction, JPMorgan Chase acquired certain loans with evidence of deterioration of credit quality since the origination and for which it was probable, at acquisition, that the Firm would be unable to collect all contractually required payments receivable. These purchased credit-impaired loans are accounted for on a pool basis, and the pools are considered to be performing. At the time of the acquisition, these loans were recorded at fair value, including an estimate of losses that are expected to be incurred over the estimated remaining lives of the loan pools. Many of the assumptions and estimates underlying the estimation of the initial fair value and the ongoing updates to management's expectation of future cash flows are both significant and subjective, particularly considering the current economic environment. The level of future home price declines, the duration and severity of the current economic downturn, and the lack of market liquidity and transparency are factors that have influenced, and may continue to affect, these assumptions and estimates.

Determining which loans are included in the scope is highly subjective and requires significant judgment. In the Washington Mutual transaction, consumer loans with certain attributes (e.g., higher loan-to-value ratios, borrowers with lower FICO scores, delinquencies) were determined to be credit-impaired, provided that those attributes arose subsequent to the loans' origination dates. A wholesale loan was determined to be credit-impaired if it was risk-rated such that it would otherwise have required an asset-specific allowance for loan losses.

Loans determined to be purchased credit-impaired were initially recorded at fair value, which included estimated future credit losses.

If such loans had not been within the scope of the accounting guidance for purchased credit-impaired loans, they would have been recorded at the present values of amounts to be received determined at appropriate current interest rates, less an allowance for loan losses (i.e., the Washington Mutual allowance for loan losses would have been carried over at the acquisition date).

The Firm estimated the fair value of its purchased credit-impaired loans at the acquisition date by discounting the cash flows expected to be collected at a market-observable discount rate, when available, adjusted for factors that a market participant would consider in determining fair value. The initial estimate of cash flows to be collected was derived from assumptions such as default rates, loss severities and the amount and timing of prepayments.

The accounting guidance for these loans provides that the excess of the cash flows initially expected to be collected over the fair value of the loans at the acquisition date (i.e., the accretable yield) should be accreted into interest income at a level rate of return over the term of the loan, provided that the timing and amount of future cash flows is reasonably estimable. The initial estimate of cash flows expected to be collected must be updated each subsequent reporting period based on updated assumptions regarding default rates, loss severities, the amounts and timing of prepayments and other factors that are reflective of current market conditions. Probable decreases in expected loan principal cash flows after acquisition trigger the recognition of impairment, through the provision and allowance for loan losses, which is then measured based on the present value of the expected principal loss, plus any related foregone interest cash flows discounted at the pool's effective interest rate. Probable and significant increases in expected principal cash flows would first reverse any related allowance for loan losses; any remaining increases must be recognized prospectively as interest income over the remaining lives of the loans. The impacts of (i) prepayments, (ii) changes in variable interest rates and (iii) other changes in timing of expected cash flows are recognized prospectively as adjustments to interest income. As described above, the process of estimating cash flows expected to be collected has a significant impact on the initial recorded amount of the purchased credit-impaired loans and on subsequent recognition of impairment losses and/or interest income. Estimating these cash flows requires a significant level of management judgment. In addition, certain of the underlying assumptions are highly subjective. As of December 31, 2009, a 1% decrease in expected future principal cash payments for the entire portfolio of purchased credit-impaired loans would result in the recognition of an allowance for loan losses for these loans of approximately $800 million.

Finally, the accounting guidance states that investors may aggregate loans into pools that have common risk characteristics and thereby use a composite interest rate and estimate of cash flows expected to be collected for the pools. The Firm has aggregated substantially all of the purchased credit-impaired loans identified in the Washington Mutual transaction (i.e., the residential real estate loans) into pools with common risk characteristics. The pools then become the unit of accounting and are considered one loan for purposes of accounting for these loans at and subsequent to acquisition. Once a pool is assembled, the integrity of the pool must be maintained. Significant judgment is required in evaluating whether individual loans have common risk characteristics for purposes of establishing pools of loans.

Goodwill impairment

Under U.S. GAAP, goodwill must be allocated to reporting units and tested for impairment at least annually. The Firm's process and methodology used to conduct goodwill impairment testing is described in Note 17 on pages 222–225 of this Annual Report.

Management applies significant judgment when estimating the fair value of its reporting units. Imprecision in estimating (a) the future earnings potential of the Firm's reporting units and (b) the relevant cost of equity or terminal value growth rates can affect the estimated fair value of the reporting units. The fair values of a significant majority of the Firm's reporting units exceeded their carrying values by substantial amounts (fair value as a percent of carrying value ranged from 140% to 500%) and thus, did not indicate a significant risk of goodwill impairment based on current projections and valuations.

However, the goodwill associated with the Firm's consumer lending businesses in RFS and CS have elevated risk due to their exposure to U.S. consumer credit risk. The valuation of these businesses and their assets are particularly dependent upon economic conditions (including unemployment rates and home prices) that affect consumer credit risk and behavior, as well as potential legislative and regulatory changes that could affect the Firm's consumer lending businesses. The assumptions used in the valuation of these businesses include portfolio outstanding balances, net interest margin, operating expense and forecasted credit losses and were made using management's best projections. The cost of equity used in the discounted cash flow model reflected the estimated risk and uncertainty for these businesses and was evaluated in comparison with relevant market peers. The fair value of the credit card lending business within CS exceeded its carrying value by approximately 8%. The fair value of a consumer lending business within RFS did not exceed its carrying value; however, implied fair value of the goodwill allocated to this consumer lending business within RFS significantly exceeded its carrying value.

The Firm did not recognize goodwill impairment as of December 31, 2009, based on management's best estimates. However, prolonged weakness or deterioration in economic market conditions, or additional regulatory or legislative changes, may result in declines in projected business performance beyond management's expectations. This could cause the estimated fair values of the Firm's reporting units or their associated goodwill to decline, which may result in a material impairment charge to earnings in a future period related to some portion of their associated goodwill.

Income taxes

JPMorgan Chase is subject to the income tax laws of the various jurisdictions in which it operates, including U.S. federal, state and local and non-U.S. jurisdictions. These laws are often complex and may be subject to different interpretations. To determine the financial statement impact of accounting for income taxes, including the provision for income tax expense and unrecognized tax benefits, JPMorgan Chase must make assumptions and judgments about how to interpret and apply these complex tax laws to numerous transactions and business events, as well as the timing of when certain items may affect taxable income in the U.S. and non-U.S. tax jurisdictions.

JPMorgan Chase's interpretations of tax laws around the world are subject to review and examination by the various taxing authorities in the jurisdictions where the Firm operates, and disputes may occur regarding its view on a tax position. These disputes over interpretations with the various taxing authorities may be settled by audit, administrative appeals or adjudication by the court systems of the tax jurisdictions in which the Firm operates. JPMorgan Chase regularly reviews whether it may be assessed additional income taxes as a result of the resolution of these matters, and the Firm records additional reserves as appropriate. In addition, the Firm may revise its estimate of income taxes due to changes in income tax laws, legal interpretations and tax planning strategies. It is possible that revisions in the Firm's estimate of income taxes may materially affect the Firm's results of operations in any reporting period.

The Firm's provision for income taxes is composed of current and deferred taxes. Deferred taxes arise from differences between assets and liabilities measured for financial reporting versus income tax return purposes. Deferred tax assets are recognized if, in management's judgment, their realizability is determined to be more likely than not. The Firm has also recognized deferred tax assets in connection with certain net operating losses. The Firm performs regular reviews to ascertain the realizability of its deferred tax assets. These reviews include management's estimates and assumptions regarding future taxable income, which also incorporates various tax planning strategies, including strategies that may be available to utilize net operating losses before they expire. In connection with these reviews, if a deferred tax asset is determined to be unrealizable, a valuation allowance is established. As of December 31, 2009, management has determined it is more likely than not that the Firm will realize its deferred tax assets, net of the existing valuation allowance.

The Firm adjusts its unrecognized tax benefits as necessary when additional information becomes available. Uncertain tax positions that meet the more-likely-than-not recognition threshold are measured to determine the amount of benefit to recognize. An uncertain tax position is measured at the largest amount of benefit that management believes is more likely than not to be realized upon settlement. It is possible that the reassessment of JPMorgan Chase's unrecognized tax benefits may have a material impact on its effective tax rate in the period in which the reassessment occurs.

ACCOUNTING AND REPORTING DEVELOPMENTS

FASB Accounting Standards Codification

In July 2009, the FASB implemented the FASB Accounting Standards Codification (the "Codification") as the single source of authoritative U.S. generally accepted accounting principles. The Codification simplifies the classification of accounting standards into one online database under a common referencing system, organized into eight areas, ranging from industry-specific to general financial statement matters. Use of the Codification is effective for interim and annual periods ending after September 15, 2009. The Firm began to use the Codification on the effective date, and it had no impact on the Firm's Consolidated Financial Statements. However, throughout this Annual Report, all references to prior FASB, AICPA and EITF accounting pronouncements have been removed, and all non-SEC accounting guidance is referred to in terms of the applicable subject matter.

Business combinations/noncontrolling interests in consolidated financial statements

In December 2007, the FASB issued guidance which amended the accounting and reporting of business combinations, as well as noncontrolling (i.e., minority) interests. For JPMorgan Chase, the guidance became effective for business combinations that close on or after January 1, 2009. The guidance for noncontrolling interests, as amended, became effective for JPMorgan Chase for fiscal periods beginning January 1, 2009. In April 2009, the FASB issued additional guidance, which amends the accounting for contingencies acquired in a business combination.

The amended guidance for business combinations generally only impacts the accounting for transactions that closed after December 31, 2008, and generally only impacts certain aspects of business combination accounting, such as the accounting for transaction costs and certain merger-related restructuring reserves, as well as the accounting for partial acquisitions where control is obtained by JPMorgan Chase. One exception to the prospective application of the business-combination guidance relates to accounting for income taxes associated with transactions that closed prior to January 1, 2009. Once the purchase accounting measurement period closes for these acquisitions, any further adjustments to income taxes recorded as part of these business combinations will impact income tax expense. Previously, these adjustments were predominantly recorded as adjustments to goodwill.

The guidance for noncontrolling interests, as amended, requires that they be accounted for and presented as equity if material, rather than as a liability or mezzanine equity. The presentation and disclosure requirements for noncontrolling interests are to be applied retrospectively. The adoption of the reporting requirements for noncontrolling interests was not material to the Firm's Consolidated Balance Sheets or results of operations.

Accounting for transfers of financial assets and repurchase financing transactions

In February 2008, the FASB issued guidance which requires an initial transfer of a financial asset and a repurchase financing that was entered into contemporaneously with, or in contemplation of, the initial transfer to be evaluated together as a linked transaction, unless certain criteria are met. The Firm adopted the guidance on January 1, 2009, for transactions entered into after the date of adoption. The adoption of the guidance did not have a material impact on the Firm's Consolidated Balance Sheets or results of operations.

Disclosures about derivative instruments and hedging activities

In March 2008, the FASB issued guidance which amends the prior disclosure requirements for derivatives. The guidance, which is effective for fiscal years beginning after November 15, 2008, requires increased disclosures about derivative instruments and hedging activities and their effects on an entity's financial position, financial performance and cash flows. The Firm adopted the guidance on January 1, 2009, and it only affected JPMorgan Chase's disclosures of derivative instruments and related hedging activities, and not its Consolidated Balance Sheets or results of operations.

Determining whether instruments granted in share-based payment transactions are participating securities

In June 2008, the FASB issued guidance for participating securities, which clarifies that unvested stock-based compensation awards containing nonforfeitable rights to dividends or dividend equivalents (collectively, "dividends"), are considered participating securities and therefore included in the two-class method calculation of EPS. Under this method, all earnings (distributed and undistributed) are allocated to common shares and participating securities based on their respective rights to receive dividends. The guidance is effective for financial statements issued for fiscal years beginning after December 15, 2008, and interim periods within those years. The Firm adopted the guidance retrospectively effective January 1, 2009, and EPS data for all prior periods have been revised. Adoption of the guidance did not affect the Firm's results of operations, but basic and diluted EPS were reduced as disclosed in Note 25 on page 232 of this Annual Report.

Determining whether an instrument (or embedded feature) is indexed to an entity's own stock

In June 2008, the FASB issued guidance which establishes a two-step process for evaluating whether equity-linked financial instruments and embedded features are indexed to a company's own stock for purposes of determining whether the derivative scope exception should be applied. The guidance is effective for fiscal years beginning after December 2008. The adoption of this guidance on January 1, 2009, did not have an impact on the Firm's Consolidated Balance Sheets or results of operations.

Employers' disclosures about postretirement benefit plan assets

In December 2008, the FASB issued guidance requiring more detailed disclosures about employers' plan assets, including investment strategies, classes of plan assets, concentrations of risk within plan assets and valuation techniques used to measure their fair value. This guidance is effective for fiscal years ending after December 15, 2009. The Firm adopted these additional disclosure requirements on December 31, 2009, and it only affected JPMorgan Chase's disclosures and not its Consolidated Balance Sheets or results of operations. Refer to Note 8 on pages 184–191 of this Annual Report for additional information.

The recognition and presentation of other-than-temporary impairment

In April 2009, the FASB issued guidance which amends the other-than-temporary impairment model for debt securities. Under the guidance, an other-than-temporary-impairment must be recognized if an investor has the intent to sell the debt security or if it is more likely than not that it will be required to sell the debt security before recovery of its amortized cost basis. In addition, the guidance changes the amount of impairment to be recognized in current-period earnings when an investor does not have the intent to sell, or if it is more likely than not that it will not be required to sell the debt security, as in these cases only the amount of the impairment associated with credit losses is recognized in income. The guidance also requires additional disclosures regarding the calculation of credit losses, as well as factors considered in reaching a conclusion that an investment is not other-than-temporarily impaired. The guidance is effective for interim and annual reporting periods ending after June 15, 2009, with early adoption permitted for periods ending after March 15, 2009. The Firm elected to early adopt the guidance as of January 1, 2009. For additional information regarding the impact on the Firm of the adoption of the guidance, see Note 11 on pages 195–199 of this Annual Report.

Determining fair value when the volume and level of activity for the asset or liability have significantly decreased, and identifying transactions that are not orderly

In April 2009, the FASB issued guidance for estimating fair value when the volume and level of activity for an asset or liability have significantly declined. The guidance also includes identifying circumstances that indicate a transaction is not orderly. The guidance is effective for interim and annual reporting periods ending after June 15, 2009, with early adoption permitted. The Firm elected to early adopt the guidance in the first quarter of 2009. The application of the guidance did not have an impact on the Firm's Consolidated Balance Sheets or results of operations.

Interim disclosures about fair value of financial instruments

In April 2009, the FASB issued guidance that requires disclosures about the fair value of certain financial instruments (including financial instruments not carried at fair value) to be presented in interim financial statements in addition to annual financial statements. The guidance is effective for interim reporting periods ending after June 15, 2009, with early adoption permitted for periods ending after March 15, 2009. The Firm adopted the additional disclosure requirements for second-quarter 2009 reporting.

Subsequent events

In May 2009, the FASB issued guidance that established general standards of accounting for and disclosure of events that occur after the balance sheet date but before financial statements are issued or are available to be issued. The guidance was effective for interim or annual financial periods ending after June 15, 2009. The Firm adopted the guidance in the second quarter of 2009. The application of the guidance did not have any impact on the Firm's Consolidated Balance Sheets or results of operations.

Accounting for transfers of financial assets and consolidation of variable interest entities

In June 2009, the FASB issued guidance which amends the accounting for the transfers of financial assets and the consolidation of VIEs. The guidance eliminates the concept of QSPEs and provides additional guidance with regard to accounting for transfers of financial assets. The guidance also changes the approach for determining the primary beneficiary of a VIE from a quantitative risk and rewards-based model to a qualitative model, based on control and economics. The guidance became effective for annual reporting periods beginning after November 15, 2009, including all interim periods within the first annual reporting period. The Firm adopted the new guidance for VIEs on January 1, 2010, which required the consolidation of the Firm's credit card securitization trusts, bank-administered asset-backed commercial paper conduits, and certain mortgage and other consumer securitization entities. At adoption, the Firm added approximately $88 billion of U.S. GAAP assets, and stockholders' equity decreased by approximately $4 billion.

In February 2010, the FASB finalized an amendment that defers the requirements of the new consolidation guidance for determining the primary beneficiary of a VIE for certain investment funds, including mutual funds, private equity funds and hedge funds. For the funds included in the deferral, the Firm will continue to apply other existing authoritative guidance to determine whether such funds should be consolidated; as such, these funds are not included in the above disclosure of the impact of adopting the new guidance for VIEs.

For additional information about the impact to the Firm of the adoption of the new guidance on January 1, 2010, see Note 16 on pages 214–222 of this Annual Report.

Measuring liabilities at fair value

In August 2009, the FASB issued guidance clarifying how to develop fair value measurements for liabilities, particularly where there may be a lack of observable market information. This guidance is effective for interim or annual periods beginning after August 26, 2009. The Firm adopted the guidance in the third quarter of 2009, and it did not have an impact on the Firm's Consolidated Balance Sheets or results of operations.

Measuring fair value of certain alternative investments
In September 2009, the FASB issued guidance which amends the guidance on fair value measurements and offers a practical expedient for measuring the fair value of investments in certain entities that calculate net asset value ("NAV") per share when the fair value is not readily determinable. This guidance is effective for the first interim or annual reporting period ending after December 15, 2009. The Firm adopted the guidance in the fourth quarter of 2009, and it did not have a material impact on the Firm's Consolidated Balance Sheets or results of operations.

Fair value measurements and disclosures
In January 2010, the FASB issued guidance that requires new disclosures, and clarifies existing disclosure requirements, about fair value measurements. The clarifications and the requirement to separately disclose transfers of instruments between level 1 and level 2 of the fair value hierarchy are effective for interim reporting periods beginning after December 15, 2009; however, the requirement to provide purchases, sales, issuances and settlements in the level 3 rollforward on a gross basis is effective for fiscal years beginning after December 15, 2010. Early adoption of the guidance is permitted.

NONEXCHANGE-TRADED COMMODITY DERIVATIVE CONTRACTS AT FAIR VALUE

In the normal course of business, JPMorgan Chase trades nonexchange-traded commodity derivative contracts. To determine the fair value of these contracts, the Firm uses various fair value estimation techniques, primarily based on internal models with significant observable market parameters. The Firm's nonexchange-traded commodity derivative contracts are primarily energy-related.

The following table summarizes the changes in fair value for nonexchange-traded commodity derivative contracts for the year ended December 31, 2009.

For the year ended December 31, 2009 (in millions)	Asset position	Liability position
Net fair value of contracts outstanding at January 1, 2009	$ 7,432	$ 5,139
Effect of legally enforceable master netting agreements	48,091	48,726
Gross fair value of contracts outstanding at January 1, 2009	55,523	53,865
Contracts realized or otherwise settled	(31,444)	(30,248)
Fair value of new contracts	12,050	10,192
Changes in fair values attributable to changes in valuation techniques and assumptions	—	—
Other changes in fair value	(5,820)	(5,582)
Gross fair value of contracts outstanding at December 31, 2009	30,309	28,227
Effect of legally enforceable master netting agreements	(25,282)	(26,490)
Net fair value of contracts outstanding at December 31, 2009	$ 5,027	$ 1,737

The following table indicates the maturities of nonexchange-traded commodity derivative contracts at December 31, 2009.

December 31, 2009 (in millions)	Asset position	Liability position
Maturity less than 1 year	$ 14,130	$ 11,544
Maturity 1–3 years	12,352	9,962
Maturity 4–5 years	2,787	1,960
Maturity in excess of 5 years	1,040	4,761
Gross fair value of contracts outstanding at December 31, 2009	30,309	28,227
Effect of legally enforceable master netting agreements	(25,282)	(26,490)
Net fair value of contracts outstanding at December 31, 2009	$ 5,027	$ 1,737

FORWARD-LOOKING STATEMENTS

From time to time, the Firm has made and will make forward-looking statements. These statements can be identified by the fact that they do not relate strictly to historical or current facts. Forward-looking statements often use words such as "anticipate," "target," "expect," "estimate," "intend," "plan," "goal," "believe," "assume" or other words of similar meaning. Forward-looking statements provide JPMorgan Chase's current expectations or forecasts of future events, circumstances, results or aspirations. JPMorgan Chase's disclosures in this Annual Report contain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995. The Firm also may make forward-looking statements in its other documents filed or furnished with the SEC. In addition, the Firm's senior management may make forward-looking statements orally to analysts, investors, representatives of the media and others.

All forward-looking statements are, by their nature, subject to risks and uncertainties, many of which are beyond the Firm's control. JPMorgan Chase's actual future results may differ materially from those set forth in its forward-looking statements. While there is no assurance that any list of risks and uncertainties or risk factors is complete, below are certain factors which could cause actual results to differ from those in the forward-looking statements:

- local, regional and international business, economic and political conditions and geopolitical events;
- changes in financial services regulation;
- changes in trade, monetary and fiscal policies and laws;
- securities and capital markets behavior, including changes in market liquidity and volatility;
- changes in investor sentiment or consumer spending or savings behavior;
- ability of the Firm to manage effectively its liquidity;
- credit ratings assigned to the Firm or its subsidiaries;
- the Firm's reputation;
- ability of the Firm to deal effectively with an economic slowdown or other economic or market difficulty;
- technology changes instituted by the Firm, its counterparties or competitors;
- mergers and acquisitions, including the Firm's ability to integrate acquisitions;
- ability of the Firm to develop new products and services;
- acceptance of the Firm's new and existing products and services by the marketplace and the ability of the Firm to increase market share;
- ability of the Firm to attract and retain employees;
- ability of the Firm to control expense;
- competitive pressures;
- changes in the credit quality of the Firm's customers and counterparties;
- adequacy of the Firm's risk management framework;
- changes in laws and regulatory requirements;
- adverse judicial proceedings;
- changes in applicable accounting policies;
- ability of the Firm to determine accurate values of certain assets and liabilities;
- occurrence of natural or man-made disasters or calamities or conflicts, including any effect of any such disasters, calamities or conflicts on the Firm's power generation facilities and the Firm's other commodity-related activities;
- the other risks and uncertainties detailed in Part 1, Item 1A: Risk Factors in the Firm's Annual Report on Form 10-K for the year ended December 31, 2009.

Any forward-looking statements made by or on behalf of the Firm speak only as of the date they are made, and JPMorgan Chase does not undertake to update forward-looking statements to reflect the impact of circumstances or events that arise after the date the forward-looking statement was made. The reader should, however, consult any further disclosures of a forward-looking nature the Firm may make in any subsequent Annual Reports on Form 10-K, Quarterly Reports on Form 10-Q, or Current Reports on Form 8-K.

Management's report on internal control over financial reporting

Management of JPMorgan Chase & Co. ("JPMorgan Chase" or the "Firm") is responsible for establishing and maintaining adequate internal control over financial reporting. Internal control over financial reporting is a process designed by, or under the supervision of, the Firm's principal executive and principal financial officers, or persons performing similar functions, and effected by JPMorgan Chase's Board of Directors, management and other personnel, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with accounting principles generally accepted in the United States of America.

JPMorgan Chase's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records, that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the Firm's assets; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the Firm are being made only in accordance with authorizations of JPMorgan Chase's management and directors; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of the Firm's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

Management has completed an assessment of the effectiveness of the Firm's internal control over financial reporting as of December 31, 2009. In making the assessment, management used the framework in "Internal Control – Integrated Framework" promulgated by the Committee of Sponsoring Organizations of the Treadway Commission, commonly referred to as the "COSO" criteria.

Based upon the assessment performed, management concluded that as of December 31, 2009, JPMorgan Chase's internal control over financial reporting was effective based upon the COSO criteria. Additionally, based upon management's assessment, the Firm determined that there were no material weaknesses in its internal control over financial reporting as of December 31, 2009.

The effectiveness of the Firm's internal control over financial reporting as of December 31, 2009, has been audited by PricewaterhouseCoopers LLP, an independent registered public accounting firm, as stated in their report which appears herein.

Report of independent registered public accounting firm

PricewaterhouseCoopers LLP • 300 Madison Avenue • New York, NY 10017

Report of Independent Registered Public Accounting Firm To the Board of Directors and Stockholders of JPMorgan Chase & Co.:

In our opinion, the accompanying consolidated balance sheets and the related consolidated statements of income, changes in stockholders' equity and comprehensive income and cash flows present fairly, in all material respects, the financial position of JPMorgan Chase & Co. and its subsidiaries (the "Firm") at December 31, 2009 and 2008, and the results of their operations and their cash flows for each of the three years in the period ended December 31, 2009, in conformity with accounting principles generally accepted in the United States of America. Also in our opinion, the Firm maintained, in all material respects, effective internal control over financial reporting as of December 31, 2009, based on criteria established in *Internal Control - Integrated Framework* issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO). The Firm's management is responsible for these financial statements, for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting, included in the accompanying "Management's report on internal control over financial reporting." Our responsibility is to express opinions on these financial statements and on the Firm's internal control over financial reporting based on our integrated audits. We conducted our audits in accordance with the standards of the Public Company Accounting Oversight Board (United States). Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the financial statements are free of material misstatement and whether effective internal control over financial reporting was maintained in all material respects. Our audits of the financial statements included examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements, assessing the accounting principles used and significant estimates made by management, and evaluating the overall financial statement presentation. Our audit of internal control over financial reporting included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, and testing and evaluating the design and operating effectiveness of internal control based on the assessed risk. Our audits also included performing such other procedures as we considered necessary in the circumstances. We believe that our audits provide a reasonable basis for our opinions.

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (i) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (ii) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (iii) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

Note: In 2008, the fair values of noncash assets acquired and liabilities assumed in: (1) the merger with Bear Stearns were $288.2 billion and $287.7 billion, respectively (approximately 26 million shares of common stock valued at approximately $1.2 billion were issued in connection with the Bear Stearns merger); and (2) the Washington Mutual transaction were $260.3 billion and $260.1 billion, respectively.

The Notes to Consolidated Financial Statements are an integral part of these statements.

Note 1 – Basis of presentation

JPMorgan Chase & Co. ("JPMorgan Chase" or the "Firm"), a financial holding company incorporated under Delaware law in 1968, is a leading global financial services firm and one of the largest banking institutions in the United States of America ("U.S."), with operations worldwide. The Firm is a leader in investment banking, financial services for consumers and businesses, financial transaction processing and asset management. For a discussion of the Firm's business segment information, see Note 34 on pages 245–247 of this Annual Report.

The accounting and financial reporting policies of JPMorgan Chase and its subsidiaries conform to accounting principles generally accepted in the United States of America ("U.S. GAAP"). Additionally, where applicable, the policies conform to the accounting and reporting guidelines prescribed by bank regulatory authorities.

Certain amounts in prior periods have been reclassified to conform to the current presentation.

Consolidation

The Consolidated Financial Statements include the accounts of JPMorgan Chase and other entities in which the Firm has a controlling financial interest. All material intercompany balances and transactions have been eliminated.

The usual condition for a controlling financial interest is ownership of a majority of the voting interests of the entity. However, a controlling financial interest also may be deemed to exist with respect to entities, such as special purpose entities ("SPEs"), through arrangements that do not involve controlling voting interests.

SPEs are an important part of the financial markets, providing market liquidity by facilitating investors' access to specific portfolios of assets and risks. For example, they are critical to the functioning of the mortgage- and asset-backed securities and commercial paper markets. SPEs may be organized as trusts, partnerships or corporations and are typically established for a single, discrete purpose. SPEs are not typically operating entities and usually have a limited life and no employees. The basic SPE structure involves a company selling assets to the SPE. The SPE funds the purchase of those assets by issuing securities to investors. The legal documents that govern the transaction specify how the cash earned on the assets must be allocated to the SPE's investors and other parties that have rights to those cash flows. SPEs are generally structured to insulate investors from claims on the SPE's assets by creditors of other entities, including the creditors of the seller of the assets.

There are two different accounting frameworks applicable to SPEs: the qualifying SPE ("QSPE") framework and the variable interest entity ("VIE") framework. The applicable framework depends on the nature of the entity and the Firm's relation to that entity. The QSPE framework is applicable when an entity transfers (sells) financial assets to an SPE meeting certain defined criteria. These criteria are designed to ensure that the activities of the entity are essentially predetermined at the inception of the vehicle and that the transferor of the financial assets cannot exercise control over the entity and the assets therein. Entities meeting these criteria are not consolidated by the transferor or other counterparties as long as they do not have the unilateral ability to liquidate or to cause the entity to no longer meet the QSPE criteria. The Firm primarily follows the QSPE model for securitizations of its residential and commercial mortgages, and credit card, automobile and student loans. For further details, see Note 15 on pages 206–213 of this Annual Report.

When an SPE does not meet the QSPE criteria, consolidation is assessed pursuant to the VIE framework. A VIE is defined as an entity that: (1) lacks enough equity investment at risk to permit the entity to finance its activities without additional subordinated financial support from other parties; (2) has equity owners that lack the right to make significant decisions affecting the entity's operations; and/or (3) has equity owners that do not have an obligation to absorb the entity's losses or the right to receive the entity's returns.

U.S. GAAP requires a variable interest holder (i.e., a counterparty to a VIE) to consolidate the VIE if that party will absorb a majority of the expected losses of the VIE, receive the majority of the expected residual returns of the VIE, or both. This party is considered the primary beneficiary. In making this determination, the Firm thoroughly evaluates the VIE's design, capital structure and relationships among the variable interest holders. When the primary beneficiary cannot be identified through a qualitative analysis, the Firm performs a quantitative analysis, which computes and allocates expected losses or residual returns to variable interest holders. The allocation of expected cash flows in this analysis is based on the relative rights and preferences of each variable interest holder in the VIE's capital structure. The Firm reconsiders whether it is the primary beneficiary of a VIE when certain events occur. For further details, see Note 16 on pages 214–222 of this Annual Report.

All retained interests and significant transactions between the Firm, QSPEs and nonconsolidated VIEs are reflected on JPMorgan Chase's Consolidated Balance Sheets and in the Notes to consolidated financial statements.

Investments in companies that are considered to be voting-interest entities in which the Firm has significant influence over operating and financing decisions are either accounted for in accordance with the equity method of accounting or at fair value if elected under fair value option. These investments are generally included in other assets, with income or loss included in other income.

Generally, Firm-sponsored asset management funds are considered voting entities as the funds do not meet the conditions to be VIEs. In instances where the Firm is the general partner or managing member of limited partnerships or limited liability companies, the non-affiliated partners or members have the substantive ability to remove the Firm as the general partner or managing member without cause (i.e., kick-out rights), based on a simple unaffiliated majority vote, or have substantive participating rights. Accordingly, the Firm does not consolidate these funds. In limited cases where the non-affiliated partners or members do not have substantive kick-outs or participating right, the Firm consolidates the funds.

Private equity investments, which are recorded in other assets on the Consolidated Balance Sheets, include investments in buyouts, growth equity and venture opportunities. These investments are accounted for under investment company guidelines. Accordingly, these investments, irrespective of the percentage of equity ownership interest held, are carried on the Consolidated Balance Sheets at fair value.

Assets held for clients in an agency or fiduciary capacity by the Firm are not assets of JPMorgan Chase and are not included in the Consolidated Balance Sheets.

Use of estimates in the preparation of consolidated financial statements

The preparation of Consolidated Financial Statements requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities, revenue and expense, and disclosures of contingent assets and liabilities. Actual results could be different from these estimates.

Foreign currency translation

JPMorgan Chase revalues assets, liabilities, revenue and expense denominated in non-U.S. currencies into U.S. dollars using applicable exchange rates.

Gains and losses relating to translating functional currency financial statements for U.S. reporting are included in other comprehensive income/(loss) within stockholders' equity. Gains and losses relating to nonfunctional currency transactions, including non-U.S. operations where the functional currency is the U.S. dollar, are reported in the Consolidated Statements of Income.

Statements of cash flows

For JPMorgan Chase's Consolidated Statements of Cash Flows, cash is defined as those amounts included in cash and due from banks.

Note 2 – Business changes and developments

Decrease in Common Stock Dividend

On February 23, 2009, the Board of Directors reduced the Firm's quarterly common stock dividend from $0.38 to $0.05 per share, effective for the dividend payable April 30, 2009, to shareholders of record on April 6, 2009.

Acquisition of the banking operations of Washington Mutual Bank

On September 25, 2008, JPMorgan Chase acquired the banking operations of Washington Mutual Bank ("Washington Mutual") from the Federal Deposit Insurance Corporation ("FDIC") for $1.9 billion. The acquisition expanded JPMorgan Chase's consumer branch network into several states, including California, Florida Washington, Georgia, Idaho, Nevada and Oregon and created the third largest branch network in the U.S. The acquisition also extends the reach of the Firm's business banking, commercial banking, credit card, consumer lending and wealth management businesses. The acquisition was accounted for under the purchase method of accounting, which requires that the assets and liabilities of Washington Mutual be initially reported at fair value.

In 2008, the $1.9 billion purchase price was preliminarily allocated to the Washington Mutual assets acquired and liabilities assumed, which resulted in negative goodwill. In accordance with U.S. GAAP for business combinations, that was in effect at the time of this acquisition, noncurrent nonfinancial assets that were not held-for-sale, such as the premises and equipment and other intangibles, acquired in the Washington Mutual transaction were written down against the negative goodwill. The negative goodwill that remained after writing down the nonfinancial assets was recognized as an extraordinary gain of $1.9 billion at December 31, 2008. The final total extraordinary gain that resulted from the Washington Mutual transaction was $2.0 billion.

The final summary computation of the purchase price and the allocation of the final total purchase price of $1.9 billion to the net assets acquired of Washington Mutual – based on their respective fair values as of September 25, 2008, and the resulting final negative goodwill of $2.0 billion are presented below.

(in millions)		
Purchase price		
Purchase price		$ 1,938
Direct acquisition costs		3
Total purchase price		1,941
Net assets acquired		
Washington Mutual's net assets before fair value adjustments	$ 39,186	
Washington Mutual's goodwill and other intangible assets	(7,566)	
Subtotal	31,620	
Adjustments to reflect assets acquired at fair value:		
Securities	(16)	
Trading assets	(591)	
Loans	(30,998)	
Allowance for loan losses	8,216	
Premises and equipment	680	
Accrued interest and accounts receivable	(243)	
Other assets	4,010	
Adjustments to reflect liabilities assumed at fair value:		
Deposits	(686)	
Other borrowed funds	68	
Accounts payable, accrued expense and other liabilities	(1,124)	
Long-term debt	1,063	
Fair value of net assets acquired		11,999
Negative goodwill before allocation to nonfinancial assets		(10,058)
Negative goodwill allocated to nonfinancial assets[a]		8,076
Negative goodwill resulting from the acquisition[b]		$ (1,982)

(a) The acquisition was accounted for as a purchase business combination, which requires the assets (including identifiable intangible assets) and liabilities (including executory contracts and other commitments) of an acquired business to be recorded at their respective fair values as of the effective date of the acquisition and consolidated with those of JPMorgan Chase. The fair value of the net assets of Washington Mutual's banking operations exceeded the $1.9 billion purchase price, resulting in negative goodwill. Noncurrent, nonfinancial assets not held-for-sale, such as premises and equipment and other intangibles, were written down against the negative goodwill. The negative goodwill that remained after writing down transaction-related core deposit intangibles of approximately $4.9 billion and premises and equipment of approximately $3.2 billion was recognized as an extraordinary gain of $2.0 billion.

(b) The extraordinary gain was recorded net of tax expense in Corporate/Private Equity.

Condensed statement of net assets acquired

The following condensed statement of net assets acquired reflects the final value assigned to the Washington Mutual net assets as of September 25, 2008.

(in millions)	September 25, 2008
Assets	
Cash and due from banks	**$ 3,680**
Deposits with banks	**3,517**
Federal funds sold and securities purchased under resale agreements	**1,700**
Trading assets	**5,691**

Loans (net of allowance for loan losses)	**206,456**
Accrued interest and accounts receivable	**3,253**
Mortgage servicing rights	**5,874**
All other assets	**16,596**
Total assets	**$ 263,991**
Liabilities	
Deposits	**$ 159,872**
Federal funds purchased and securities loaned or sold under repurchase agreements	**4,549**
Other borrowed funds	**81,636**
Trading liabilities	**585**
Accounts payable, accrued expense and other liabilities	**6,708**
Long-term debt	**6,718**
Total liabilities	**260,068**
Washington Mutual net assets acquired	**$ 3,923**

Merger with The Bear Stearns Companies Inc.

Effective May 30, 2008, BSC Merger Corporation, a wholly owned subsidiary of JPMorgan Chase, merged with The Bear Stearns Companies Inc. ("Bear Stearns") pursuant to the Agreement and Plan of Merger, dated as of March 16, 2008, as amended March 24, 2008, and Bear Stearns became a wholly owned subsidiary of JPMorgan Chase. The merger provided the Firm with a leading global prime brokerage platform; strengthened the Firm's equities and asset management businesses; enhanced capabilities in mortgage origination, securitization and servicing; and expanded the platform of the Firm's energy business. The merger was accounted for under the purchase method of accounting, which requires that the assets and liabilities of Bear Stearns be fair valued. The final total purchase price to complete the merger was $1.5 billion.

The merger with Bear Stearns was accomplished through a series of transactions that were reflected as step acquisitions. On April 8, 2008, pursuant to the share exchange agreement, JPMorgan Chase acquired 95 million newly issued shares of Bear Stearns common stock (or 39.5% of Bear Stearns common stock after giving effect to the issuance) for 21 million shares of JPMorgan Chase common stock. Further, between March 24, 2008, and May 12, 2008, JPMorgan Chase acquired approximately 24 million shares of Bear Stearns common stock in the open market at an average purchase price of $12.37 per share. The share exchange and cash purchase transactions resulted in JPMorgan Chase owning approximately 49.4% of Bear Stearns common stock immediately prior to consummation of the merger. Finally, on May 30, 2008, JPMorgan Chase completed the merger. As a result of the merger, each outstanding share of Bear Stearns common stock (other than shares then held by JPMorgan Chase) was converted into the right to receive 0.21753 shares of common stock of JPMorgan Chase. Also, on May 30, 2008, the shares of common stock that JPMorgan Chase and Bear Stearns acquired from each other in the share exchange transaction were cancelled. From April 8, 2008, through May 30, 2008, JPMorgan Chase accounted for the investment in Bear Stearns under the equity method of accounting. During this period, JPMorgan Chase recorded reductions to its investment in Bear Stearns representing its share of Bear Stearns net losses, which was recorded in other income and accumulated other comprehensive income.

In conjunction with the Bear Stearns merger, in June 2008, the Federal Reserve Bank of New York (the "FRBNY") took control, through a limited liability company ("LLC") formed for this purpose, of a portfolio of $30 billion in assets acquired from Bear Stearns, based on the value of the portfolio as of March 14, 2008. The assets of the LLC were funded by a $28.85 billion term loan from the FRBNY, and a $1.15 billion subordinated loan from JPMorgan Chase. The JPMorgan Chase note is subordinated to the FRBNY loan and will bear the first $1.15 billion of any losses of the portfolio. Any remaining assets in the portfolio after repayment of the FRBNY loan, the JPMorgan Chase note and the expense of the LLC will be for the account of the FRBNY.

As a result of step acquisition accounting, the final total purchase price of $1.5 billion was allocated to the Bear Stearns assets acquired and liabilities assumed using their fair values as of April 8, 2008, and May 30, 2008, respectively. The final summary computation of the purchase price and the allocation of the final total purchase price of $1.5 billion to the net assets acquired of Bear Stearns are presented below.

(in millions, except for shares (in thousands), per share amounts and where otherwise noted)		
Purchase price		
Shares exchanged in the Share Exchange transaction (April 8, 2008)	95,000	
Other Bear Stearns shares outstanding	145,759	
Total Bear Stearns stock outstanding	240,759	
Cancellation of shares issued in the Share Exchange transaction	(95,000)	
Cancellation of shares acquired by JPMorgan Chase for cash in the open market	(24,061)	
Bear Stearns common stock exchanged as of May 30, 2008	121,698	
Exchange ratio	0.21753	
JPMorgan Chase common stock issued	26,473	
Average purchase price per JPMorgan Chase common share[a]	$ 45.26	
Total fair value of JPMorgan Chase common stock issued		$ 1,198
Bear Stearns common stock acquired for cash in the open market (24 million shares at an average share price of $12.37 per share)		298
Fair value of employee stock awards (largely to be settled by shares held in the RSU Trust[b])		242
Direct acquisition costs		27
Less: Fair value of Bear Stearns common stock held in the RSU Trust and included in the exchange of common stock		(269)[b]
Total purchase price		1,496
Net assets acquired		
Bear Stearns common stockholders' equity	$ 6,052	
Adjustments to reflect assets acquired at fair value:		
Trading assets	(3,877)	
Premises and equipment	509	
Other assets	(288)	
Adjustments to reflect liabilities assumed at fair value:		
Long-term debt	504	
Other liabilities	(2,289)	
Fair value of net assets acquired excluding goodwill		611
Goodwill resulting from the merger[c]		$ 885

(a) The value of JPMorgan Chase common stock was determined by averaging the closing prices of JPMorgan Chase's common stock for the four trading days during the period March 19 through 25, 2008.

(b) Represents shares of Bear Stearns common stock held in an irrevocable grantor trust (the "RSU Trust"), to be used to settle stock awards granted to selected employees and certain key executives under certain heritage Bear Stearns employee stock plans. Shares in the RSU Trust were exchanged for 6 million shares of JPMorgan Chase common stock at the merger exchange ratio of 0.21753. For further discussion of the RSU Trust, see Note 9 on pages 192–194 of this Annual Report.

(c) The goodwill was recorded in Investment Bank ("IB") and is not tax-deductible.

Condensed statement of net assets acquired

The following condensed statement of net assets acquired reflects the final values assigned to the Bear Stearns net assets as of May 30, 2008.

(in millions)	May 30, 2008
Assets	
Cash and due from banks	**$ 534**
Federal funds sold and securities purchased under resale agreements	**21,204**
Securities borrowed	**55,195**
Trading assets	**136,489**
Loans	**4,407**
Accrued interest and accounts receivable	**34,677**
Goodwill	**885**
All other assets	**35,377**
Total assets	**$ 288,768**
Liabilities	
Federal funds purchased and securities loaned or sold under repurchase agreements	**$ 54,643**
Other borrowings	**16,166**
Trading liabilities	**24,267**
Beneficial interests issued by consolidated VIEs	**47,042**
Long-term debt	**67,015**
Accounts payable and other liabilities	**78,569**
Total liabilities	**287,702**
Bear Stearns net assets[a]	**$ 1,066**

(a) Reflects the fair value assigned to 49.4% of the Bear Stearns net assets acquired on April 8, 2008 (net of related amortization), and the fair value assigned to the remaining 50.6% of the Bear Stearns net assets acquired on May 30, 2008. The difference between the net assets acquired, as presented above, and the fair value of the net assets acquired (including goodwill), presented in the previous table, represents JPMorgan Chase's net losses recorded under the equity method of accounting.

Unaudited pro forma condensed combined financial information reflecting the Bear Stearns merger and Washington Mutual transaction

The following unaudited pro forma condensed combined financial information presents the 2008 and 2007 results of operations of the Firm as they may have appeared, if the Bear Stearns merger and the Washington Mutual transaction had been completed on January 1, 2008, and January 1, 2007.

Year ended December 31, (in millions, except per share data)	2008	2007
Total net revenue	$ 68,149	$ 92,052
Income/(loss) before extraordinary gain	(14,090)	17,733
Net income/(loss)	(12,184)	17,733
Net income per common share data:		
Basic earnings per share[a]		
Income/(loss) before extraordinary gain	$ (4.26)	$ 5.02
Net income/(loss)	(3.72)	5.02
Diluted earnings per share[a][b]		
Income/(loss) before extraordinary gain	(4.26)	4.96
Net income/(loss)	(3.72)	4.96
Average common shares issued and outstanding		
Basic	3,510.5	3,429.6
Diluted	3,510.5	3,471.3

(a) Effective January 1, 2009, the Firm implemented FASB guidance for participating securities. Accordingly, prior-period amounts have been revised. For further discussion of the guidance, see Note 25 on page 232 of this Annual Report.

(b) Common equivalent shares have been excluded from the pro forma computation of diluted loss per share for the year ended December 31, 2008, as the effect would be antidilutive.

The unaudited pro forma combined financial information is presented for illustrative purposes only and does not indicate the financial results of the combined company had the companies actually been combined as of January 1, 2008, and as of January 1, 2007, nor is it indicative of the results of operations in future periods. Included in the unaudited pro forma combined financial information for the years ended December 31, 2008 and 2007, were pro forma adjustments to reflect the results of operations of Bear Stearns and Washington Mutual's banking operations, considering the purchase accounting, valuation and accounting conformity adjustments related to each transaction. For the Washington Mutual transaction, the amortization of purchase accounting adjustments to report interest-earning assets acquired and interest-bearing liabilities assumed at current interest rates is reflected for the years ended December 31, 2008 and 2007. Valuation adjustments and the adjustment to conform allowance methodologies in the Washington Mutual transaction, and valuation and accounting conformity adjustments related to the Bear Stearns merger are reflected in the results for the years ended December 31, 2008 and 2007.

Internal reorganization related to the Bear Stearns merger

On June 30, 2008, JPMorgan Chase fully and unconditionally guaranteed each series of outstanding preferred stock of Bear Stearns, as well as all of Bear Stearns' outstanding U.S. Securities and Exchange Commission ("SEC") registered U.S. debt securities and obligations relating to trust preferred capital debt securities. Subsequently, on July 15, 2008, JPMorgan Chase completed an internal merger transaction, which resulted in each series of outstanding preferred stock of Bear Stearns being automatically exchanged into newly-issued shares of JPMorgan Chase preferred stock having substantially identical terms. Depositary shares, which formerly had represented a one-fourth interest in a share of Bear Stearns preferred stock, continue to trade on the New York Stock Exchange but following completion of this internal merger transaction, represent a one-fourth interest in a share of JPMorgan Chase preferred stock. In addition, pursuant to internal transactions in July 2008 and the first quarter 2009, JPMorgan Chase assumed or guaranteed the remaining outstanding securities of Bear Stearns and its subsidiaries, in each case in accordance with the indentures and other agreements governing those securities.

Other business events

Purchase of remaining interest in J.P. Morgan Cazenove

On January 4, 2010, JPMorgan Chase purchased the remaining interest in J.P. Morgan Cazenove, an investment banking business partnership formed in 2005, which will result in an adjustment to the Firm's capital surplus.

Termination of Chase Paymentech Solutions joint venture

The dissolution of Chase Paymentech Solutions joint venture, a global payments and merchant acquiring joint venture between JPMorgan Chase and First Data Corporation, was completed on November 1, 2008. JPMorgan Chase retained approximately 51% of the business, which it operates under the name Chase Paymentech Solutions. The dissolution of the Chase Paymentech Solutions joint venture was accounted for as a step acquisition in accordance with U.S. GAAP for business combinations, and the Firm recognized an after-tax gain of $627 million in the fourth quarter of 2008 as a result of the dissolution. The gain represents the amount by which the fair value of the net assets acquired (predominantly intangible assets and goodwill) exceeded JPMorgan Chase's carrying value in the net assets transferred to First

Data Corporation. Upon dissolution, the Firm consolidated the retained Chase Paymentech Solutions business.

Proceeds from Visa Inc. shares

On March 19, 2008, Visa Inc. ("Visa") completed its initial public offering ("IPO"). Prior to the IPO, JPMorgan Chase held approximately a 13% equity interest in Visa. On March 28, 2008, Visa used a portion of the proceeds from the offering to redeem a portion of the Firm's equity interest, which resulted in the recognition of a pretax gain of $1.5 billion (recorded in other income). In conjunction with the IPO, Visa placed $3.0 billion in escrow to cover liabilities related to certain litigation matters. The escrow was increased by $1.1 billion in 2008 and by $700 million in 2009. JPMorgan Chase's interest in the escrow was recorded as a reduction of other expense and reported net to the extent of established litigation reserves.

Purchase of remaining interest in Highbridge Capital Management

In January 2008, JPMorgan Chase purchased an additional equity interest in Highbridge Capital Management, LLC ("Highbridge"), which resulted in the Firm owning 77.5% of Highbridge. In July 2009, JPMorgan Chase completed its purchase of the remaining interest in Highbridge, which resulted in a $228 million adjustment to capital surplus.

Subsequent events

The Firm has performed an evaluation of events that have occurred subsequent to December 31, 2009, and through February 24, 2010 (the date of the filing of this Annual Report). There have been no material subsequent events that occurred during such period that would require disclosure in this Annual Report, or would be required to be recognized in the Consolidated Financial Statements, as of or for the year ended December 31, 2009.

Note 3 – Fair value measurement

JPMorgan Chase carries a portion of its assets and liabilities at fair value. The majority of such assets and liabilities are carried at fair value on a recurring basis. Certain assets and liabilities are carried at fair value on a nonrecurring basis, including loans accounted for at the lower of cost or fair value that are only subject to fair value adjustments under certain circumstances.

The Firm has an established and well-documented process for determining fair values. Fair value is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. Fair value is based on quoted market prices, where available. If listed prices or quotes are not available, fair value is based on internally developed models that primarily use, as inputs, market-based or independently sourced market parameters, including but not limited to yield curves, interest rates, volatilities, equity or debt prices, foreign exchange rates and credit curves. In addition to market information, models also incorporate transaction details, such as maturity of the instrument. Valuation adjustments may be made to ensure that financial instruments are recorded at fair value. These adjustments include amounts to reflect counterparty credit quality, the Firm's creditworthiness, constraints on liquidity and unobservable parameters. Valuation adjustments are applied consistently over time.

- Credit valuation adjustments ("CVA") are necessary when the market price (or parameter) is not indicative of the credit quality of the counterparty. As few classes of derivative contracts are listed on an exchange, the majority of derivative positions are valued using internally developed models that use as their basis observable market parameters. Market practice is to quote parameters equivalent to an "AA" credit rating whereby all counterparties are assumed to have the same credit quality. Therefore, an adjustment is necessary to reflect the credit quality of each derivative counterparty to arrive at fair value. The adjustment also takes into account contractual factors designed to reduce the Firm's credit exposure to each counterparty, such as collateral and legal rights of offset.
- Debit valuation adjustments ("DVA") are necessary to reflect the credit quality of the Firm in the valuation of liabilities measured at fair value. The methodology to determine the adjustment is consistent with CVA and incorporates JPMorgan Chase's credit spread as observed through the credit default swap market.
- Liquidity valuation adjustments are necessary when the Firm may not be able to observe a recent market price for a financial instrument that trades in inactive (or less active) markets or to reflect the cost of exiting larger-than-normal market-size risk positions (liquidity adjustments are not taken for positions classified within level 1 of the fair value hierarchy). The Firm tries to ascertain the amount of uncertainty in the initial valuation based on the degree of liquidity in the market in which the financial instrument trades and makes liquidity adjustments to the carrying value of the financial instrument. The Firm measures the liquidity adjustment based on the following factors: (1) the amount of time since the last relevant pricing point; (2) whether there was an actual trade or relevant external quote; and (3) the volatility of the principal risk component of the financial instrument. Costs to exit larger-than-normal market-size risk positions are determined based on the size of the adverse market move that is likely to occur during the period required to bring a position down to a nonconcentrated level.
- Unobservable parameter valuation adjustments are necessary when positions are valued using internally developed models that use as their basis unobservable parameters – that is, parameters that must be estimated and are, therefore, subject to management judgment. These positions are normally traded less actively. Examples include certain credit products where parameters such as correlation and recovery rates are unobservable. Unobservable parameter valuation adjustments are applied to mitigate the possibility of error and revision in the estimate of the market price provided by the model.

The Firm has numerous controls in place intended to ensure that its fair valuations are appropriate. An independent model review group reviews the Firm's valuation models and approves them for

use for specific products. All valuation models within the Firm are subject to this review process. A price verification group, independent from the risk-taking function, ensures observable market prices and market-based parameters are used for valuation wherever possible. For those products with material parameter risk for which observable market levels do not exist, an independent review of the assumptions made on pricing is performed. Additional review includes deconstruction of the model valuations for certain structured instruments into their components, and benchmarking valuations, where possible, to similar products; validating valuation estimates through actual cash settlement; and detailed review and explanation of recorded gains and losses, which are analyzed daily and over time. Valuation adjustments, which are also determined by the independent price verification group, are based on established policies and are applied consistently over time. Any changes to the valuation methodology are reviewed by management to confirm that the changes are justified. As markets and products develop and the pricing for certain products becomes more or less transparent, the Firm continues to refine its valuation methodologies. During 2009, no changes were made to the Firm's valuation models that had, or are expected to have, a material impact on the Firm's Consolidated Balance Sheets or results of operations.

The methods described above to estimate fair value may produce a fair value calculation that may not be indicative of net realizable value or reflective of future fair values. Furthermore, while the Firm believes its valuation methods are appropriate and consistent with other market participants, the use of different methodologies or assumptions to determine the fair value of certain financial instruments could result in a different estimate of fair value at the reporting date.

Valuation Hierarchy

A three-level valuation hierarchy has been established under U.S. GAAP for disclosure of fair value measurements. The valuation hierarchy is based on the transparency of inputs to the valuation of an asset or liability as of the measurement date. The three levels are defined as follows.

- Level 1 – inputs to the valuation methodology are quoted prices (unadjusted) for identical assets or liabilities in active markets.
- Level 2 – inputs to the valuation methodology include quoted prices for similar assets and liabilities in active markets, and inputs that are observable for the asset or liability, either directly or indirectly, for substantially the full term of the financial instrument.
- Level 3 – one or more inputs to the valuation methodology are unobservable and significant to the fair value measurement.

A financial instrument's categorization within the valuation hierarchy is based on the lowest level of input that is significant to the fair value measurement.

Following is a description of the valuation methodologies used by the Firm to measure instruments at fair value, including the general classification of such instruments pursuant to the valuation hierarchy.

Assets

Securities purchased under resale agreements ("resale agreements") and securities borrowed

To estimate the fair value of resale agreements and securities borrowed transactions, cash flows are evaluated taking into consideration any derivative features of the resale agreement and are then discounted using the appropriate market rates for the applicable maturity. As the inputs into the valuation are primarily based on readily observable pricing information, such resale agreements are classified within level 2 of the valuation hierarchy.

Loans and unfunded lending-related commitments

The majority of the Firm's loans and lending-related commitments are not carried at fair value on a recurring basis on the Consolidated Balance Sheets, nor are they actively traded. The fair value of such loans and lending-related commitments is included in the additional disclosures of fair value of certain financial instruments required by U.S. GAAP on pages 171–172 of this Note. Loans carried at fair value on a recurring and nonrecurring basis are included in the applicable tables that follow.

Wholesale

There is no liquid secondary market for most loans and lending-related commitments in the Firm's wholesale portfolio. In the limited circumstances where direct secondary market information, including pricing of actual market transactions, broker quotations or quoted market prices for similar instruments, is available (principally for loans in the Firm's secondary trading portfolio), such information is used in the determination of fair value. For the remainder of the portfolio, fair value is estimated using a discounted cash flow ("DCF") model. In addition to the characteristics of the underlying loans (including principal, customer rate and contractual fees), key inputs to the model include interest rates, prepayment rates, and credit spreads. The credit spread input is derived from the cost of credit default swaps ("CDS") and, as a result, also incorporates the effects of secondary market liquidity. As many of the Firm's clients do not have bonds traded with sufficient liquidity in the public markets to have observable CDS spreads, the Firm principally develops benchmark credit curves by industry and credit rating to estimate fair value. Additional adjustments to account for the difference in recovery rates between bonds, on which the cost of credit derivatives is based, and loans as well as loan equivalents (which represent the portion of an unused commitment expected, based on the Firm's average portfolio historical experience, to become outstanding prior to an obligor default) are also incorporated into the valuation process.

For a discussion of the valuation of mortgage loans carried at fair value, see the "Mortgage-related exposures carried at fair value" section of this Note on pages 169–170.

The Firm's loans carried at fair value are classified within level 2 or 3 of the valuation hierarchy depending on the level of liquidity and activity in the markets for a particular product.

Consumer

The only products in the Firm's consumer loan portfolio with a meaningful level of secondary market activity in the current economic environment are certain conforming residential mortgages. These loans are classified as trading assets and carried at fair value on the Consolidated Balance Sheets. They are predominantly classified within level 2 of the valuation hierarchy based on the level of market liquidity and activity. For further discussion of the valuation of mortgage loans carried at fair value see the "Mortgage-related exposures carried at fair value" section on pages 169–170 of this Note.

The fair value of the Firm's other consumer loans (except for credit card receivables) is generally determined by discounting the loan principal and interest cash flows expected to be collected at a market observable discount rate, when available. Portfolio-specific factors that a market participant would consider in determining fair value (e.g., expected lifetime credit losses, estimated prepayments, servicing costs and market liquidity) are either modeled into the cash flow projections or incorporated as an adjustment to the discount rate. For products that continue to be offered in the market, discount rates are derived from market-observable primary origination spreads. Where primary origination spreads are not available (i.e., subprime mortgages, subprime home equity and option adjustable-rate mortgages ("option ARMs"), the valuation is based on the Firm's estimate of a market participant's required return on equity for similar products (i.e., a hypothetical origination spread). Estimated lifetime credit losses consider expected and current default rates for existing portfolios, collateral prices (where applicable) and expectations about changes in the economic environment (e.g., unemployment rates).

The fair value of credit card receivables is determined using a discounted expected cash flow methodology. Key estimates and assumptions include: projected interest income and late fee revenue, funding, servicing, credit costs, and loan payment rates. The projected loan payment rates are used to determine the estimated life of the credit card loan receivables, which are then discounted using a risk-appropriate discount rate. The discount rate is derived from the Firm's estimate of a market participant's expected return on credit card receivables. As the credit card receivables have a short-term life, an amount equal to the allowance for credit losses is considered to be a reasonable proxy for the credit cost component.

Loans that are not carried on the Consolidated Balance Sheets at fair value are not classified within the fair value hierarchy.

Securities

Where quoted prices for identical securities are available in an active market, securities are classified in level 1 of the valuation hierarchy. Level 1 securities include highly liquid government bonds, mortgage products for which there are quoted prices in active markets such as U.S. government agency or U.S. government-sponsored enterprise (collectively, "U.S. government agencies"), pass-through mortgage-backed securities ("MBS"), and exchange-traded equities (e.g., common and preferred stocks).

If quoted market prices are not available for the specific security, the Firm may estimate the value of such instruments using a combination of observed transaction prices, independent pricing services and relevant broker quotes. Consideration is given to the nature of the quotes (e.g., indicative or firm) and the relationship of recently evidenced market activity to the prices provided from independent pricing services. The Firm may also use pricing models or discounted cash flows. The majority of such instruments are classified within level 2 of the valuation hierarchy; however, in cases where there is limited activity or less transparency around inputs to the valuation, securities are classified within level 3 of the valuation hierarchy.

For certain collateralized mortgage and debt obligations, asset-backed securities ("ABS") and high-yield debt securities, the determination of fair value may require benchmarking to similar instruments or analyzing default and recovery rates. For "cash" collateralized debt obligations ("CDOs"), external price information is not available. Therefore, cash CDOs are valued using market-standard models, such as Intex, to model the specific collateral composition and cash flow structure of each deal; key inputs to the model are market spread data for each credit rating, collateral type and other relevant contractual features. ABS are valued based on external prices or market spread data, using current market assumptions on prepayments and defaults. For those ABS where the external price data is not observable or the limited available data is opaque, the collateral performance is monitored and the value of the security is assessed. To benchmark its valuations, the Firm looks to transactions for similar instruments and utilizes independent prices provided by third-party vendors, broker quotes and relevant market indices, such as the ABX index, as applicable. While none of those sources are solely indicative of fair value, they serve as directional indicators for the appropriateness of the Firm's estimates. The majority of collateralized mortgage and debt obligations, high-yield debt securities and ABS are currently classified in level 3 of the valuation hierarchy. For further discussion of the valuation of mortgage securities carried at fair value see the "Mortgage-related exposures carried at fair value" section of this Note on pages 169–170.

Commodities

Commodities inventory are carried at the lower of cost or fair value. The fair value of commodities inventory is determined primarily using pricing and data derived from the markets on which the underlying commodities are traded. The majority of commodities inventory is classified within level 1 of the valuation hierarchy.

The Firm also has positions in commodities-based derivatives that can be traded on an exchange or over-the-counter ("OTC") and carried at fair value. The pricing inputs to these derivatives include forward curves of underlying commodities, basis curves, volatilities, correlations, and occasionally other model parameters. The valuation of these derivatives is based on calibrating to market transactions, as well as to independent pricing information from sources such as brokers and dealer consensus pricing services. Where inputs are unobservable, they are benchmarked to observable market data based on historic and implied correlations, then adjusted for uncertainty where appropriate. The majority of commodities-based derivatives are classified within level 2 of the valuation hierarchy.

Derivatives

Exchange-traded derivatives valued using quoted prices are classified within level 1 of the valuation hierarchy. However, few classes of derivative contracts are listed on an exchange; thus, the majority of the Firm's derivative positions are valued using internally developed models that use as their basis readily observable market parameters – that is, parameters that are actively quoted and can be validated to external sources, including industry pricing services. Depending on the types and contractual terms of derivatives, fair value can be modeled using a series of techniques, such as the Black-Scholes option pricing model, simulation models or a combination of various models, which are consistently applied. Where derivative products have been established for some time, the Firm uses models that are widely accepted in the financial services industry. These models reflect the contractual terms of the derivatives, including the period to maturity, and market-based parameters such as interest rates, volatility, and the credit quality of the counterparty. Further, many of these models do not contain a high level of subjectivity, as the methodologies used in the models do not require significant judgment, and inputs to the models are readily observable from actively quoted markets, as is the case for "plain vanilla" interest rate swaps, option contracts and CDS. Such instruments are generally classified within level 2 of the valuation hierarchy.

Derivatives that are valued based on models with significant unobservable market parameters and that are normally traded less actively, have trade activity that is one way, and/or are traded in less-developed markets are classified within level 3 of the valuation hierarchy. Level 3 derivatives include, for example, CDS referenced to certain MBS, certain types of CDO transactions, options on baskets of single-name stocks, and callable exotic interest rate options.

Other complex products, such as those sensitive to correlation between two or more underlying parameters, also fall within level 3 of the valuation hierarchy. Such instruments include complex credit derivative products which are illiquid and non-standard in nature, including CDOs and CDO-squared. A CDO is a debt instrument collateralized by a variety of debt obligations, including CDS, bonds and loans of different maturities and credit qualities. The repackaging of such securities and loans within a CDO results in the creation of tranches, which are instruments with different risk profiles. In a CDO-squared transaction, the instrument is a CDO where the underlying debt instruments are also CDOs. For most CDO and CDO-squared transactions, while inputs such as CDS spreads and recovery rates may be observable, the correlation between the underlying debt instruments is unobservable. The correlation levels are not only modeled on a portfolio basis but are also calibrated at a transaction level to liquid benchmark tranches. For all complex credit derivative products, actual transactions, where available, are used to regularly recalibrate all unobservable parameters.

Correlation sensitivity is also material to the overall valuation of options on baskets of single-name stocks; the valuation of these baskets is typically not observable due to their non-standardized structuring. Correlation for products such as these is typically estimated based on an observable basket of stocks and then adjusted to reflect the differences between the underlying equities.

For callable exotic interest rate options, while most of the assumptions in the valuation can be observed in active markets (e.g. interest rates and volatility), the callable option transaction flow is essentially one-way, and as such, price observability is limited. As pricing information is limited, assumptions are based on the dynamics of the underlying markets (e.g., the interest rate markets) including the range and possible outcomes of the applicable inputs. In addition, the models used are calibrated, as relevant, to liquid benchmarks, and valuation is tested against monthly independent pricing services and actual transactions.

Mortgage servicing rights and certain retained interests in securitizations

Mortgage servicing rights ("MSRs") and certain retained interests from securitization activities do not trade in an active, open market with readily observable prices. Accordingly, the Firm estimates the fair value of MSRs and certain other retained interests in securitizations using DCF models.

- For MSRs, the Firm uses an option-adjusted spread ("OAS") valuation model in conjunction with the Firm's proprietary prepayment model to project MSR cash flows over multiple interest rate scenarios, which are then discounted at risk-adjusted rates to estimate the fair value of the MSRs. The OAS model considers portfolio characteristics, contractually specified servicing fees, prepayment assumptions, delinquency rates, late charges, other ancillary revenue, costs to service and other economic factors. The Firm reassesses and periodically adjusts the underlying inputs and assumptions used in the OAS model to reflect market conditions and assumptions that a market participant would consider in valuing the MSR asset. Due to the nature of the valuation inputs, MSRs are classified within level 3 of the valuation hierarchy.
- For certain retained interests in securitizations, the Firm estimates the fair value for those retained interests by calculating the present value of future expected cash flows using modeling techniques. Such models incorporate management's best estimates of key variables, such as expected credit losses, prepayment speeds and the discount rates appropriate for the risks involved. Changes in the assumptions used may have a significant impact on the Firm's valuation of retained interests,

and such interests are therefore typically classified within level 3 of the valuation hierarchy.

For both MSRs and certain other retained interests in securitizations, the Firm compares its fair value estimates and assumptions to observable market data where available and to recent market activity and actual portfolio experience. For further discussion of the most significant assumptions used to value retained interests and MSRs, as well as the applicable stress tests for those assumptions, see Note 17 on pages 222–225 of this Annual Report.

Private equity investments

The valuation of nonpublic private equity investments, which are held primarily by the Private Equity business within the Corporate/Private Equity line of business, requires significant management judgment due to the absence of quoted market prices, the inherent lack of liquidity and the long-term nature of such assets. As such, private equity investments are valued initially based on cost. Each quarter, valuations are reviewed utilizing available and relevant market data to determine if the carrying value of these investments should be adjusted. Such market data primarily include observations of the trading multiples of public companies considered comparable to the private companies being valued and the operating performance of the underlying portfolio company, including its historical and projected net income and earnings before interest, taxes, depreciation and amortization ("EBITDA"). Valuations are adjusted to account for company-specific issues, the lack of liquidity inherent in a nonpublic investment and the fact that comparable public companies are not identical to the companies being valued. In addition, a variety of additional factors are reviewed by management, including, but not limited to, financing and sales transactions with third parties, future expectations of the particular investment, changes in market outlook and the third-party financing environment. Nonpublic private equity investments are included in level 3 of the valuation hierarchy.

Private equity investments also include publicly held equity investments, generally obtained through the initial public offering of privately held equity investments. Publicly held investments in liquid markets are marked to market at the quoted public value less adjustments for regulatory or contractual sales restrictions. Discounts for restrictions are quantified by analyzing the length of the restriction period and the volatility of the equity security. Publicly held investments are largely classified in level 2 of the valuation hierarchy.

Other fund investments

The Firm holds investments in mutual/collective investment funds, private equity funds, hedge funds and real estate funds. Where the funds produce a daily net asset value ("NAV") that is validated by a sufficient level of observable activity (purchases and sales at NAV), the NAV is used to value the fund investment and it is classified in level 1 of the valuation hierarchy. Where adjustments to the NAV are required, for example, with respect to interests in funds subject to restrictions on redemption (such as lock-up periods or withdrawal limitations) and/or observable activity for the fund investment is limited, investments are classified within level 2 or 3 of the valuation hierarchy.

Liabilities

Securities sold under repurchase agreements ("repurchase agreements")

To estimate the fair value of repurchase agreements, cash flows are evaluated taking into consideration any derivative features of the repurchase agreements and are then discounted using the appropriate market rates for the applicable maturity. Generally, for these types of agreements, there is a requirement that collateral be maintained with a market value equal to, or in excess of, the principal amount loaned; as a result, there would be no adjustment, or an immaterial adjustment, to reflect the credit quality of the Firm (i.e., DVA) related to these agreements. As the inputs into the valuation are primarily based on observable pricing information, repurchase agreements are classified within level 2 of the valuation hierarchy.

Beneficial interests issued by consolidated VIEs

The fair value of beneficial interests issued by consolidated VIEs ("beneficial interests") is estimated based on the fair value of the underlying assets held by the VIEs. The valuation of beneficial interests does not include an adjustment to reflect the credit quality of the Firm, as the holders of these beneficial interests do not have recourse to the general credit of JPMorgan Chase. Where the inputs into the valuation are based on observable market pricing information, the beneficial interests are classified within level 2 of the valuation hierarchy. Where significant inputs into the valuation are unobservable, the beneficial interests are classified within level 3 of the valuation hierarchy.

Deposits, other borrowed funds and long-term debt

Included within deposits, other borrowed funds and long-term debt are structured notes issued by the Firm that are financial instruments containing embedded derivatives. To estimate the fair value of structured notes, cash flows are evaluated taking into consideration any derivative features and are then discounted using the appropriate market rates for the applicable maturities. In addition, the valuation of structured notes includes an adjustment to reflect the credit quality of the Firm (i.e., the DVA). Where the inputs into the valuation are primarily based on observable market prices, the structured notes are classified within level 2 of the valuation hierarchy. Where significant inputs are unobservable, the structured notes are classified within level 3 of the valuation hierarchy.

The following tables present financial instruments measured at fair value as of December 31, 2009 and 2008, by major product category on the Consolidated Balance Sheets and by the fair value hierarchy (as described above).

Assets and liabilities measured at fair value on a recurring basis

	Fair value hierarchy				
December 31, 2009 (in millions)	Level 1	Level 2	Level 3	Netting adjustments	Total fair value
Federal funds sold and securities purchased under resale agreements	$ —	$ 20,536	$ —	$ —	$ 20,536

(a) Includes total U.S. government-sponsored enterprise obligations of $195.8 billion and $182.1 billion at December 31, 2009 and 2008, respectively, which were predominantly mortgage-related.
(b) For further discussion of residential and commercial MBS, see the "Mortgage-related exposure carried at fair value" section of this Note on pages 169–170.
(c) Included within trading loans at December 31, 2009 and 2008, respectively, are $15.7 billion and $12.1 billion of residential first-lien mortgages and $2.7 billion and $4.3 billion of commercial first-lien mortgages. For further discussion of residential and commercial loans carried at fair value or the lower of cost or fair value, see the "Mortgage-related exposure carried at fair value" section of this Note on pages 169–170.
(d) Physical commodities inventories are accounted for at the lower of cost or fair value.
(e) As permitted under U.S. GAAP, the Firm has elected to net derivative receivables and derivative payables and the related cash collateral received and paid when a legally enforceable master netting agreement exists. For purposes of the tables above, the Firm does not reduce derivative receivables and derivative payables balances for this netting adjustment, either within or across the levels of the fair value hierarchy, as such netting is not relevant to a presentation based on the transparency of inputs to the valuation of an asset or liability. Therefore, the balances reported in the fair value hierarchy table are gross of any counterparty netting adjustments. However, if the Firm were to net such balances, the reduction in the level 3 derivative receivable and derivative payable balances would be $16.0 billion at December 31, 2009.
(f) Private equity instruments represent investments within the Corporate/Private Equity line of business. The cost basis of the private equity investment portfolio was $8.8 billion and $8.3 billion at December 31, 2009 and 2008, respectively.
(g) Includes assets within accrued interest receivable and other assets at December 31, 2009 and 2008.
(h) Balances include investments valued at NAV at December 31, 2009, of $16.8 billion, of which $9.0 billion is classified in level 1, $3.2 billion in level 2 and $4.6 billion in level 3.
(i) Includes assets for which the Firm serves as an intermediary between two parties and does not bear market risk. The assets are predominantly reflected within derivative receivables.

Changes in level 3 recurring fair value measurements

The following tables include a rollforward of the activity for financial instruments classified by the Firm within level 3 of the fair value hierarchy for the years ended December 31, 2009, 2008 and 2007 (including changes in fair value). Level 3 financial instruments typically include, in addition to the unobservable or level 3 components, observable components (that is, components that are actively quoted and can be validated to external sources); accordingly, the gains and losses in the table below include changes in fair value due in part to observable factors that are part of the valuation methodology. Also, the Firm risk manages the observable components of level 3 financial instruments using securities and derivative positions that are classified within level 1 or 2 of the fair value hierarchy; as these level 1 and level 2 risk management instruments are not included below, the gains or losses in the following tables do not reflect the effect of the Firm's risk management activities related to such level 3 instruments.

(a) For further discussion of residential and commercial MBS, see the "Mortgage-related exposures carried at fair value" section of this Note on pages 169–170.
(b) Includes assets within accrued interest receivable and other assets at December 31, 2009, 2008 and 2007.
(c) Reported in principal transactions revenue, except for changes in fair value for Retail Financial Services ("RFS") mortgage loans originated with the intent to sell, which are reported in mortgage fees and related income.
(d) Realized gains and losses on available-for-sale securities, as well as other-than-temporary impairment losses that are recorded in earnings, are reported in securities gains. Unrealized gains and losses are reported in other comprehensive income.
(e) Changes in fair value for RFS mortgage servicing rights are measured at fair value and reported in mortgage fees and related income.
(f) Predominantly reported in other income.
(g) Beginning January 1, 2008, all transfers into and/or out of level 3 are assumed to occur at the beginning of the reporting period.
(h) Level 3 liabilities as a percentage of total Firm liabilities accounted for at fair value (including liabilities carried at fair value on a nonrecurring basis) were 29%, 25% and 17% at December 31, 2009, 2008 and 2007, respectively.

Assets and liabilities measured at fair value on a nonrecurring basis

Certain assets, liabilities and unfunded lending-related commitments are measured at fair value on a nonrecurring basis; that is, the instruments are not measured at fair value on an ongoing basis but are subject to fair value adjustments only in certain circumstances (for example, when there is evidence of impairment). The following tables present the financial instruments carried on the Consolidated Balance Sheets by caption and level within the valuation hierarchy (as described above) as of December 31, 2009 and 2008, for which a nonrecurring change in fair value has been recorded during the reporting period.

Total other assets	—	1,763	291	2,054
Total assets at fair value on a nonrecurring basis	$ —	$ 6,754	$ 4,290	$ 11,044
Accounts payable and other liabilities[c]	$ —	$ 212	$ 98	$ 310
Total liabilities at fair value on a nonrecurring basis	$ —	$ 212	$ 98	$ 310

(a) Reflects delinquent mortgage and home equity loans where the carrying value is based on the fair value of the underlying collateral.
(b) Predominantly includes leveraged lending loans carried on the Consolidated Balance Sheets at the lower of cost or fair value.
(c) Represents, at December 31, 2009 and 2008, the fair value adjustment associated with $648 million and $1.5 billion, respectively, of unfunded held-for-sale lending-related commitments within the leveraged lending portfolio.

Nonrecurring fair value changes

The following table presents the total change in value of financial instruments for which a fair value adjustment has been included in the Consolidated Statements of Income for the years ended December 31, 2009, 2008 and 2007, related to financial instruments held at these dates.

Year ended December 31, (in millions)	2009	2008	2007
Loans retained	**$ (3,550)**	$ (1,159)	$ (218)
Loans held-for-sale	**(389)**	(2,728)	(502)
Total loans	**(3,939)**	(3,887)	(720)
Other assets	**(104)**	(685)	(161)
Accounts payable and other liabilities	**31**	(285)	2
Total nonrecurring fair value gains/(losses)	**$ (4,012)**	$ (4,857)	$ (879)

In the above table, loans predominantly include: (1) write-downs of delinquent mortgage and home equity loans where impairment is based on the fair value of the underlying collateral; and (2) the change in fair value for leveraged lending loans carried on the Consolidated Balance Sheets at the lower of cost or fair value. Accounts payable and other liabilities predominantly include the change in fair value for unfunded lending-related commitments within the leveraged lending portfolio.

Level 3 analysis

Level 3 assets (including assets measured at fair value on a nonrecurring basis) were 6% of total Firm assets at both December 31, 2009 and 2008. Level 3 assets were $130.4 billion at December 31, 2009, reflecting a decrease of $7.3 billion in 2009, due to the following:

- A net decrease of $6.3 billion in gross derivative receivables, predominantly driven by the tightening of credit spreads. Offsetting a portion of the decrease were net transfers into level 3 during the year, most notably a transfer into level 3 of $41.3 billion of structured credit derivative receivables, and a transfer out of level 3 of $17.7 billion of single-name CDS on ABS. The fair value of the receivables transferred into level 3 during the year was $22.1 billion at December 31, 2009. The fair value of structured credit derivative payables with a similar underlying risk profile to the previously noted receivables, that are also classified in level 3, was $12.5 billion at December 31, 2009. These derivatives payables offset the receivables, as they are modeled and valued the same way with the same parameters and inputs as the assets.
- A net decrease of $3.5 billion in loans, predominantly driven by sales of leveraged loans and transfers of similar loans to level 2, due to increased price transparency for such assets. Leveraged loans are typically classified as held-for-sale and measured at the lower of cost or fair value and, therefore, included in the nonrecurring fair value assets.
- A net decrease of $6.3 billion in trading assets – debt and equity instruments, primarily in loans and residential- and commercial-MBS, principally driven by sales and markdowns, and by sales and unwinds of structured transactions with hedge funds. The declines were partially offset by a transfer from level 2 to level 3 of certain structured notes reflecting lower liquidity and less pricing observability, and also increases in the fair value of other ABS.
- A net increase of $6.1 billion in MSRs, due to increases in the fair value of the asset, related primarily to market interest rate and other changes affecting the Firm's estimate of future prepayments, as well as sales in RFS of originated loans for which servicing rights were retained. These increases were offset partially by servicing portfolio runoff.
- A net increase of $1.9 billion in accrued interest and accounts receivable related to increases in subordinated retained interests from the Firm's credit card securitization activities.

Gains and Losses

Gains and losses included in the tables for 2009 and 2008 included:

2009

- $11.4 billion of net losses on derivatives, primarily related to the tightening of credit spreads.
- Net losses on trading–debt and equity instruments of $671 million, consisting of $2.1 billion of losses, primarily related to residential and commercial loans and MBS, principally driven by markdowns and sales, partially offset by gains of $1.4 billion, reflecting increases in the fair value of other ABS. (For a further discussion of the gains and losses on mortgage-related exposures, inclusive of risk management activities, see the "Mortgage-related exposures carried at fair value" discussion below.)
- $5.8 billion of gains on MSRs.
- $1.4 billion of losses related to structured note liabilities, predominantly due to volatility in the equity markets.

2008

- Losses on trading-debt and equity instruments of approximately $12.8 billion, principally from mortgage-related transactions and auction-rate securities.
- Losses of $6.9 billion on MSRs.
- Losses of approximately $3.9 billion on leveraged loans.
- Net gains of $4.6 billion related to derivatives, principally due to changes in credit spreads and rate curves.
- Gains of $4.5 billion related to structured notes, principally due to significant volatility in the fixed income, commodities and equity markets.
- Private equity losses of $638 million.

For further information on changes in the fair value of the MSRs, see Note 17 on pages 223–224 of this Annual Report.

Mortgage-related exposures carried at fair value

The following table provides a summary of the Firm's mortgage-related exposures, including the impact of risk management activities. These exposures include all mortgage-related securities and loans carried at fair value regardless of their classification within the fair value hierarchy, and that are carried at fair value through earnings or at the lower of cost or fair value. The table excludes securities held in the available-for-sale portfolio, which are reported on page 170 of this Note.

	Exposure as of **December 31, 2009**		Exposure as of December 31, 2008		Net gains/(losses)[e]	
(in millions)	Gross	Net of risk management activities[d]	Gross	Net of risk management activities[d]	Reported in income – year ended **December 31, 2009**	Reported in income – year ended December 31, 2008
U.S. Residential Mortgage: [a][b][c]						
Prime	**$ 3,482**	**$ 3,482**	$ 4,612	$ 4,612		
Alt-A	**3,030**	**3,030**	3,934	3,917		
	6,512	**6,512**	8,546	8,529	**$ 537**	$ (4,093)
Subprime	**569**	**137**	941	(28)	**(76)**	(369)
Non-U.S. Residential[c]	**1,702**	**1,321**	1,591	951	**86**	(292)
Commercial Mortgage:						
Securities	**2,337**	**1,898**	2,836	1,438	**257**	(792)
Loans	**2,699**	**2,035**	4,338	2,179	**(333)**	(752)

(a) Excluded at December 31, 2009 and 2008, are certain mortgages and mortgage-related assets that are carried at fair value and recorded in trading assets, such as: (i) U.S. government agency securities that are liquid and of high credit quality of $41.7 billion and $58.9 billion, respectively; (ii) conforming mortgage loans originated with the intent to sell to U.S. government agencies of $11.1 billion and $6.2 billion, respectively; and (iii) reverse mortgages of $4.5 billion and $4.3 billion, respectively, for which the principal risk is mortality risk. Also excluded are MSRs, which are reported in Note 17 on pages 222–225 of this Annual Report.

(b) Excluded certain mortgage-related financing transactions, which are collateralized by mortgage-related assets, of $4.1 billion and $5.7 billion at December 31, 2009 and 2008, respectively. These financing transactions are excluded from the table, as they are accounted for on an accrual basis of accounting. For certain financings deemed to be impaired, impairment is measured and recognized based on the fair value of the collateral. Of these financing transactions, $136 million and $1.2 billion were considered impaired at December 31, 2009 and 2008, respectively.

(c) Total residential mortgage exposures at December 31, 2009 and 2008, include: (i) securities of $3.4 billion and $4.0 billion, respectively; (ii) loans carried at fair value or the lower of cost or fair value of $5.0 billion and $5.9 billion, respectively; and (iii) forward purchase commitments included in derivative receivables of $358 million and $1.2 billion, respectively.

(d) Amounts reflect the effects of derivatives used to manage the credit risk of the gross exposures arising from cash-based instruments. The amounts are presented on a bond- or loan-equivalent (notional) basis. Derivatives are excluded from the gross exposure, as they are principally used for risk management purposes.

(e) Net gains and losses include all revenue related to the positions (i.e., interest income, changes in fair value of the assets, changes in fair value of the related risk management positions, and interest expense related to the liabilities funding those positions).

Residential mortgages

Classification and Valuation – Residential mortgage loans and MBS are classified within level 2 or level 3 of the valuation hierarchy, depending on the level of liquidity and activity in the markets for a particular product. Level 3 assets include nonagency residential whole loans and subordinated nonagency residential MBS. Products that continue to have reliable price transparency as evidenced by consistent market transactions, such as senior nonagency securities, as well as agency securities, are classified in level 2.

For those products classified within level 2 of the valuation hierarchy, the Firm estimates the value of such instruments using a combination of observed transaction prices, independent pricing services and relevant broker quotes. Consideration is given to the nature of the quotes (e.g., indicative or firm) and the relationship of recently evidenced market activity to the prices provided from independent pricing services.

When relevant market activity is not occurring or is limited, the fair value is estimated as follows:

Residential mortgage loans – Fair value of residential mortgage loans is estimated by projecting the expected cash flows and discounting those cash flows at a rate reflective of current market liquidity. To estimate the projected cash flows (inclusive of assumptions of prepayment, default rates and loss severity), specific consideration is given to both borrower-specific and other market factors, including, but not limited to: the borrower's FICO score; the type of collateral supporting the loan; an estimate of the current value of the collateral supporting the loan; the level of documentation for the loan; and market-derived expectations for home price appreciation or depreciation in the respective geography of the borrower.
